

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

OCEOLA:

A ROMANCE.

BY CAPTAIN MAYNE REID.*

CHAPTER I.—THE FLOWERY LAND.

LINDA FLORIDA! fair land of flowers!

Thus hailed thee the bold Spanish adventurer, as, standing upon the prow of his caravel, he first caught sight of thy shores.

It was upon the Sunday of Palms—the festival of the flowers—and the devout Castilian beheld in thee a fit emblem of the day. Under the influence of a pious thought, he gave thee its name, and well deservedst thou the proud appellation.

That was three hundred years ago. Three full cycles have rolled past, since the hour of thy baptismal ceremony; but the title becomes thee as ever. Thy floral bloom is as bright at this hour as when Leon landed upon thy shores—ay, bright as when the breath of God first called thee into being.

Thy forests are still virgin and inviolate; verdant thy savannas; thy groves as fragrant as ever—those perfumed groves of aniseed and orange, of myrtle and magnolia. Still sparkles upon thy plains the cerulean ixia; still gleam in thy waters the golden nymphæ; above thy swamps yet tower the colossal cypress, the gigantic cedar, the gum, and the bay-tree; still over thy gentle slopes of silvery sand wave long-leaved pines, mingling their acetalous foliage with the frondage of the palm. Strange anomaly of vegetation; the tree of the north, and the tree of the south—the types of the frigid and torrid—in this thy mild mid-region, standing side by side, and blending their branches together!

Linda Florida! who can behold thee without peculiar emotion? without conviction that thou art a favoured land? Gazing upon thee, one ceases to wonder at the faith—the wild faith of the early adventurers—that from thy bosom gushed forth the fountain of youth, the waters of eternal life!

No wonder the sweet fancy found favour and credence; no wonder so delightful an idea had its crowds of devotees. Thousands came from afar, to find rejuvenescence by bathing in thy crystal streams—thousands sought it, with far more eagerness than the white metal of Mexico, or the yellow gold of Peru: in the search, thousands grew older instead of younger, or perished in pursuit of the vain illusion; but who could wonder?

Even at this hour, one can scarcely think it an illusion; and in that age of romance, it was still easier of belief. A new world had been discovered, why not

a new theory of life? Men looked upon a land where the leaves never fell, and the flowers never faded. The bloom was eternal—eternal the music of the birds. There was no winter—no signs of death or decay. Natural, then, the fancy, and easy the faith, that in such fair land man too might be immortal.

The delusion has long since died away, but not the beauty that gave birth to it. Thou, Florida, art still the same—still art thou emphatically the land of flowers. Thy groves are as green, thy skies as bright, thy waters as diaphanous as ever. There is no change in the loveliness of thy aspect.

And yet I observe a change. The scene is the same, but not the characters! Where are they of that red race who were born of thee, and nurtured on thy bosom? I see them not. In thy fields, I behold white and black, but not red—European and African, but not Indian—not one of that ancient people who were once thine own. Where are they?

Gone! all gone! No longer tread they thy flowery paths—no longer are thy crystal streams cleft by the keels of their canoes—no more upon thy spicy gale is borne the sound of their voices—the twang of their bowstrings is heard no more amid the trees of thy forest: they have parted from thee far and for ever.

But not willing went they away—for who could leave thee with a willing heart? No, fair Florida; thy red children were true to thee, and parted only in sore unwillingness. Long did they cling to the loved scenes of their youth; long continued they the conflict of despair, that has made them famous for ever. Whole armies, and many a hard struggle, it cost the pale-face to dispossess them; and then they went not willingly—they were torn from thy bosom like wolf-cubs from their dam, and forced to a far western land. Sad their hearts, and slow their steps, as they faced toward the setting sun. Silent or weeping, they moved onward. In all that band, there was not one voluntary exile.

No wonder they disliked to leave thee. I can well comprehend the poignancy of their grief. I too have enjoyed the sweets of thy flowery land, and parted from thee with like reluctance. I have walked under the shadows of thy majestic forests, and bathed in thy limpid streams—not with the hope of rejuvenescence, but the certainty of health and joy. Oft have I made my couch under the canopy of thy spreading palms and magnolias, or stretched myself along the green-sward of thy savannas; and, with eyes bent upon the blue ether of thy heavens, have listened to my heart repeating the words of the eastern poet:

Oh! if there be an Elysium on earth,
It is this—it is this!

CHAPTER II.

THE INDIGO PLANTATION.

My father was an indigo planter; his name was Randolph. I bear his name in full—George Randolph.

There is Indian blood in my veins. My father was of the Randolphs of Roanoke—hence descended from the Princess Pocahontas. He was proud of his Indian ancestry—almost vain of it.

It may sound paradoxical, especially to European ears; but it is true, that white men in America, who have Indian blood in them, are proud of the taint. Even to be a 'half-breed' is no badge of shame—particularly where the *sang mélé* has been gifted with fortune. Not all the volumes that have been written bear such strong testimony to the grandeur of the Indian character as this one fact—we are not ashamed to acknowledge them as ancestry!

Hundreds of white families lay claim to descent from the Virginian princess. If their claims be just, then must the fair Pocahontas have been a blessing to her lord.

I think my father was of the true lineage; at all events, he belonged to a proud family in the 'old dominion'; and during his early life had been surrounded by sable slaves in hundreds. But his rich patrimonial lands became at length worn out—profuse hospitality well-nigh ruined him; and not brooking an inferior station, he gathered up the fragments of his fortune, and 'moved' southward—there to begin the world anew.

I was born before this removal, and am therefore a native of Virginia; but my earliest impressions of a home were formed upon the banks of the beautiful Suwanee, in Florida. That was the scene of my boyhood's life—the spot consecrated to me by the joys of youth and the charms of early love.

I would paint the picture of my boyhood's home. Well do I remember it: so fair a scene is not easily effaced from the memory.

A handsome 'frame'-house, coloured white, with green Venetians over the windows, and a wide verandah extending all round. Carved wooden porticoes support the roof of this verandah, and a low balustrade with light railing separates it from the adjoining grounds—from the flower parterre in front, the orangery on the right flank, and a large garden on the left. From the outer edge of the parterre, a smooth lawn slopes gently to the bank of the river—here expanding to the dimensions of a noble lake, with distant wooded shores, islets that seem suspended in the air, wild-fowl upon the wing, and wild-fowl in the water.

Upon the lawn, behold tall tapering palms, with pinnatifid leaves—a species of *oreodoxia*—others with broad fan-shaped fronds—the *palmettoes* of the south; behold magnolias, clumps of the fragrant illicium, and radiating crowns of the *yucca gloriosa*—all indigenous to the soil. Another native presents itself to the eye—a huge live-oak extending its long horizontal boughs, covered thickly with evergreen coriaceous leaves, and broadly shadowing the grass beneath. Under its shade, behold a beautiful girl, in light summer robes—her hair loosely coiled with a white kerchief, from the folds of which have escaped long tresses glittering with the hues of gold. That is my sister Virginia, my only sister, still younger than myself. Her golden hair bespeaks not her Indian descent, but in that she takes after our mother. She is playing with her pets, the doe of the fallow deer, and its pretty spotted fawn. She is feeding them with the pulp of the sweet orange, of which they are immoderately fond. Another favourite is by her side, led by its tiny chain. It is the black fox-squirrel, with glossy coat and quivering tail. Its eccentric gambols frighten the fawn, causing

the timid creature to start over the ground, and press closer to its mother, and sometimes to my sister, for protection.

The scene has its accompaniment of music. The golden oriole, whose nest is among the orange-trees, gives out its liquid song; the mock-bird, caged in the verandah, repeats the strain with variations. The gay mimic echoes the red cardinal and the blue jay, both fluttering among the flowers of the magnolia; it mocks the chatter of the green paroquets, that are busy with the berries of the tall cypresses down by the water's edge; at intervals it repeats the wild scream of the Spanish curlews that wave their silver wings overhead, or the cry of the tanager heard from the far islets of the lake. The bark of the dog, the mewing of the cat, the hinny of mules, the neighing of horses, even the tones of the human voice, are all imitated by this versatile and incomparable songster.

The rear of the dwelling presents a different aspect—perhaps not so bright, though not less cheerful. Here is exhibited a scene of active life—a picture of the industry of an indigo plantation.

A spacious enclosure, with its 'post-and-rail' fence, adjoins the house. Near the centre of this stands the *pièce de résistance*—a grand shed that covers half an acre of ground, supported upon strong pillars of wood. Underneath are seen huge oblong vats, hewn from the great trunks of the cypress. They are ranged in threes, one above the other, and communicate by means of spigots placed in their ends. In these the precious plant is macerated, and its cerulean colour extracted.

Beyond are rows of pretty little cottages, uniform in size and shape, each embowered in its grove of orange-trees, whose ripening fruit and white wax-like flowers fill the air with perfume. These are the negro cabins. Here and there, towering above their roofs in upright attitude, or bending gently over, is the same noble palm-tree that ornaments the lawn in front. Other houses appear within the enclosure, rude structures of hewn logs, with 'clap-board' roofs: they are the stable, the corn-crib, the kitchen—this last communicating with the main dwelling by a long open gallery, with shingle roof, supported upon posts of the fragrant red cedar.

Beyond the enclosure stretch wide fields, backed by a dark belt of cypress forest that shuts out the view of the horizon. These fields exhibit the staple of cultivation, the precious dye-plant, though other vegetation appears upon them. There are maize-plants and sweet potatoes (*Convolvulus batatas*), some rice, and sugar-cane. These are not intended for commerce, but to provision the establishment.

The indigo is sown in straight rows, with intervals between. The plants are of different ages, some just bursting through the glebe with leaves like young trefoil; others full grown, above two feet in height, resemble ferns, and exhibit the light-green pinnated leaves which distinguish most of the *leguminosae*—for the indigo belongs to this tribe. Some shew their papilionaceous flowers just on the eve of bursting; but rarely are they permitted to exhibit their full bloom. Another destiny awaits them; and the hand of the reaper rudely checks their purple inflorescence.

In the enclosure, and over the indigo-fields, a hundred human forms are moving; with one or two exceptions, they are all of the African race—all slaves. They are not all of black skin—scarcely the majority of them are negroes. There are mulattoes, samboes, and quadroons. Even some who are of pure African blood are not black, only bronze-coloured; but with the exception of the 'overseer' and the owner of the plantation, all are slaves. Some are hideously ugly, with thick lips, low retreating foreheads, flat noses, and ill-formed bodies; others are well proportioned; and among them are some that might be accounted good-looking. There are women nearly white—

quadreroons. Of the latter are several that are more than good-looking—some even beautiful.

The men are in their work-dresses: loose cotton trousers, with coarse coloured shirts, and hats of palmetto-leaf. A few display dandyism in their attire. Some are naked from the waist upwards, their black skins glistening under the sun like ebony. The women are more gaily arrayed in striped prints, and heads 'toqued' with Madras kerchiefs of brilliant check. The dresses of some are tasteful and pretty. The turban-like coiffure renders them picturesque.

Both men and women are alike employed in the business of the plantation—the manufacture of the indigo. Some cut down the plants with reaping-hooks, and tie them in bundles; others carry the bundles in from the fields to the great shed; a few are employed in throwing them into the upper trough, the 'steeper,' while another few are drawing off and 'beating.' Some shovel the sediment into the draining-bags, while others superintend the drying and cutting out. All have their respective tasks, and all seem alike cheerful in the performance of them. They laugh, and chatter, and sing; they give back jest for jest; and scarcely a moment passes that merry voices are not ringing upon the ear.

And yet these are all slaves—the slaves of my father. He treats them well; seldom is the lash uplifted: hence the happy mood and cheerful aspect.

Such pleasant pictures are graven on my memory, sweetly and deeply impressed. They formed the *mise-en-scene* of my early life.

CHAPTER III.

THE TWO JAKES.

Every plantation has its 'bad fellow'—often more than one, but always one who holds pre-eminence in evil. 'Yellow Jake' was the fiend of ours.

He was a young mulatto, in person not ill-looking, but of sullen habit and morose disposition. On occasions, he had shewn himself capable of fierce resentment and cruelty.

Instances of such character are more common among mulattoes than negroes. Pride of colour on the part of the yellow man—confidence in a higher organism, both intellectual and physical, and consequently a keener sense of the injustice of his degraded position, explain this psychological difference.

As for the pure negro, he rarely enacts the unfeeling savage. In the drama of human life, he is the victim, not the villain. No matter where lies the scene—in his own land, or elsewhere—he has been used to play the rôle of the sufferer; yet his soul is still free from resentment or ferocity. In all the world, there is no kinder heart than that which beats within the bosom of the African black.

Yellow Jake was wicked without provocation. Cruelty was innate in his disposition—no doubt inherited. He was a Spanish mulatto; that is, paternally of Spanish blood—maternally, negro. His father had sold him to mine!

A slave-mother, a slave-son. The father's freedom affects not the offspring. Among the black and red races of America, the child follows the fortunes of the mother. Only she of Caucasian race can be the mother of white men.

There was another 'Jacob' upon the plantation—hence the distinctive sobriquet of 'Yellow Jake.' This other was 'Black Jake'; and only in age and size was there any similarity between the two. In disposition they differed even more than in complexion. If Yellow Jake had the brighter skin, Black Jake had the lighter heart. Their countenances exhibited a complete contrast—the contrast between a sullen frown and a cheerful smile. The white teeth of the

latter were ever set in smiles: the former smiled only when under the influence of some malicious prompting.

Black Jake was a Virginian. He was one of those belonging to the old plantation—had 'moved' along with his master; and felt those ties of attachment which in many cases exist strongly between master and slave. He regarded himself as one of our family, and gloried in bearing our name. Like all negroes born in the 'old dominion,' he was proud of his nativity. In caste, a 'Vaginnny nigger' takes precedence of all others.

Apart from his complexion, Black Jake was not ill-looking. His features were as good as those of the mulatto. He had neither the thick lips, flat nose, nor retreating forehead of his race—for these characteristics are not universal. I have known negroes of pure African blood with features perfectly regular, and such a one was Black Jake. In form, he might have passed for the Ethiopian Apollo.

There was one who thought him handsome—handsomer than his yellow namesake. This was the quadroon Viola, the belle of the plantation. For Viola's hand, the two Jakes had long time been rival suitors. Both had assiduously courted her smiles—somewhat capricious they were, for Viola was not without coquetry—but she had at length exhibited a marked preference for the black. I need not add that there was jealousy between the negro and mulatto—on the part of the latter, rank hatred of his rival—which Viola's preference had kindled into fierce resentment.

More than once had the two measured their strength, and on each occasion had the black been victorious. Perhaps to this cause, more than to his personal appearance, was he indebted for the smiles of Viola. Throughout all the world, throughout all time, beauty has bowed down before courage and strength.

Yellow Jake was our woodman; Black Jake, the curator of the horses, the driver of 'white massa's' barouche.

The story of the two Jakes—their loves and their jealousies—is but a common affair in the *petite politique* of plantation-life. I have singled it out, not from any separate interest it may possess, but as leading to a series of events that exercised an important influence on my own subsequent history.

The first of these events was as follows: Yellow Jake, burning with jealousy at the success of his rival, had grown spiteful with Viola. Meeting her by some chance in the woods, and far from the house, he had offered her a dire insult. Resentment had rendered him reckless. The opportune arrival of my sister had prevented him from using violence, but the intent could not be overlooked; and chiefly through my sister's influence, the mulatto was brought to punishment.

It was the first time that Yellow Jake had received chastisement, though not the first time he had deserved it. My father had been indulgent with him; too indulgent, all said. He had often pardoned him when guilty of faults—of crimes. My father was of an easy temper, and had an exceeding dislike to proceed to the extremity of the lash; but in this case my sister had urged, with some spirit, the necessity of the punishment. Viola was her maid; and the wicked conduct of the mulatto could not be overlooked.

The castigation did not cure him of his propensity to evil. An event occurred shortly after, that proved he was vindictive. My sister's pretty fawn was found dead by the shore of the lake. It could not have died from any natural cause—for it was seen alive, and skipping over the lawn but the hour before. No alligator could have done it, nor yet a wolf. There was neither scratch nor tear upon it; no signs of blood! It must have been strangled.

It was strangled, as proved in the sequel. Yellow

Jake had done it, and Black Jake had seen him. From the orange grove, where the latter chanced to be at work, he had been witness of the tragic scene; and his testimony procured a second flogging for the mulatto.

A third event followed close upon the heels of this—a quarrel between negro and mulatto, that came to blows. It had been sought by the latter to revenge himself, at once upon his rival in love, and the witness of his late crime.

The conflict did not end in mere blows. Yellow Jake, with an instinct derived from his Spanish paternity, drew his knife, and inflicted a severe wound upon his unarmed antagonist.

This time his punishment was more severe. I was myself enraged, for Black Jake was my 'body-guard' and favourite. Though his skin was black, and his intellect but little cultivated, his cheerful disposition rendered him a pleasant companion; he was, in fact, the chosen associate of my boyish days—my comrade upon the water and in the woods.

Justice required satisfaction, and Yellow Jake caught it in earnest.

The punishment proved of no avail. He was incorrigible. The demon spirit was too strong within him: it was part of his nature.

CHAPTER IV.

THE HOMMOCK.

Just outside the orangery was one of those singular formations—peculiar, I believe, to Florida.

A circular basin, like a vast sugar-pan, opens into the earth, to the depth of many feet, and having a diameter of forty yards or more. In the bottom of this, several cavities are seen, about the size and of the appearance of dug wells, regularly cylindrical—except where their sides have fallen in, or the rocky partition between them has given way—in which case they resemble a vast honeycomb with broken cells.

The wells are sometimes found dry; but more commonly there is water in the bottom, and often filling the great tank itself.

Such natural reservoirs, although occurring in the midst of level plains, are always partially surrounded by eminences—knolls, and detached masses of testaceous rocks; all of which are covered by an evergreen thicket of native trees, as *magnolia grandiflora*, red bay, *zanthoxylon*, live-oak, mulberry, and several species of fan-palms (palmettoes). Sometimes these shadowy coverts are found among the trees of the pine-forests, and sometimes they appear in the midst of green savannas, like islets in the ocean.

They constitute the 'hommocks' of Florida—famed in the story of its Indian wars.

One of these, then, was situated just outside the orangery; with groups of testaceous rocks forming a half-circle around its edge; and draped with the dark foliage of evergreen trees, of the species already mentioned. The water contained in the basin was sweet and limpid; and far down in its crystal depths might be seen gold and red fish, with yellow bream, spotted bass, and many other beautiful varieties of the finny tribe, disporting themselves all day long. The tank was in reality a natural fishpond; and, moreover, it was used as the family bathing-place—for, under the hot sun of Florida, the bath is a necessity as well as luxury.

From the house, it was approached by a sanded walk that led across the orangery, and some large stone-flags enabled the bather to descend conveniently into the water. Of course, only the white members of the family were allowed the freedom of this charming sanctuary.

Outside the hommock extended the fields under cultivation, until bounded in the distance by tall

forests of cypress and white cedar—a sort of impenetrable morass that covered the country for miles beyond.

On one side of the plantation-fields was a wide plain, covered with grassy turf, and without enclosure of any kind. This was the *savanna*, a natural meadow where the horses and cattle of the plantation were freely pastured. Deer often appeared upon this plain, and flocks of the wild turkey.

I was just of that age to be enamoured of the chase. Like most youth of the southern states who have little else to do, hunting was my chief occupation; and I was passionately fond of it. My father had procured for me a brace of splendid greyhounds; and it was a favourite pastime with me to conceal myself in the hommock, wait for the deer and turkeys as they approached, and then course them across the savanna. In this manner I made many a capture of both species of game; for the wild turkey can easily be run down with fleet dogs.

The hour at which I was accustomed to enjoy this amusement was early in the morning, before any of the family were astir. That was the best time to find the game upon the savanna.

One morning, as usual, I repaired to my stand in the covert. I climbed upon a rock, whose flat top afforded footing both to myself and my dogs. From this elevated position I had the whole plain under view, and could observe any object that might be moving upon it, while I was myself secure from observation. The broad leaves of the magnolia formed a bower around me, leaving a break in the foliage, through which I could make my reconnaissance.

On this particular morning I had arrived before sunrise. The horses were still in their stables, and the cattle in the enclosure. Even by the deer, the savanna was untenanted, as I could perceive at the first glance. Over all its wide extent not an antler was to be seen.

I was somewhat disappointed on observing this. My mother expected a party upon that day. She had expressed a wish to have venison at dinner: I had promised her she should have it; and on seeing the savanna empty, I felt disappointment.

I was a little surprised, too; the sight was unusual. Almost every morning, there were deer upon this wide pasture, at one point or another.

Had some early stalker been before me? Probable enough. Perhaps young Ringgold, from the next plantation; or maybe one of the Indian hunters, who seemed never to sleep? Certainly, some one had been over the ground, and frightened off the game?

The savanna was a free range, and all who chose might hunt or pasture upon it. It was a tract of common ground, belonging to no one of the plantations—government land not yet purchased.

Certainly Ringgold had been there? or old Hickman, the alligator-hunter, who lived upon the skirt of our plantation? or it might be an Indian from the other side of the river?

With such conjectures did I account for the absence of the game.

I felt chagrin. I should not be able to keep my promise; there would be no venison for dinner. A turkey I might obtain; the hour for chasing them had not yet arrived. I could hear them calling from the tall tree-tops—their loud 'gobbling' borne far and clear upon the still air of the morning. I did not care for these—the larder was already stocked with them; I had killed a brace on the preceding day. I did not want more—I wanted venison.

To procure it, I must needs try some other mode than coursing. I had my rifle with me; I could try a 'still-hunt' in the woods. Better still, I should go in the direction of old Hickman's cabin; he might help me in my dilemma. Perhaps he had been out

already? if so, he would be sure to bring home venison. I could procure a supply from him, and keep my promise.

The sun was just shewing his disc above the horizon; his rays were tinging the tops of the distant cypresses, whose light-green leaves shone with the hues of gold.

I gave one more glance over the savanna, before descending from my elevated position; in that glance I saw what caused me to change my resolution, and remain upon the rock.

A herd of deer was trooping out from the edge of the cypress woods—at that corner where the rail-fence separated the savanna from the cultivated fields.

'Ha!' thought I, 'they have been poaching upon the young maize-plants.'

I bent my eyes towards the point whence, as I supposed, they had issued from the fields. I knew there was a gap near the corner, with movable bars. I could see it from where I stood, but I now perceived that the bars were in their places!

The deer could not have been in the fields then? It was not likely they had leaped either the bars or the fence. It was a high rail-fence, with 'stakes and riders.' The bars were as high as the fence. The deer must have come out of the woods?

This observation was instantly followed by another: The animals were running rapidly, as if alarmed by the presence of some enemy.

A hunter is behind them? Old Hickman? Ringgold? Who?

I gazed eagerly, sweeping my eyes along the edge of the timber, but for a while saw no one.

'A lynx or a bear may have startled them? If so, they will not go far: I shall have a chance with my greyhounds yet. Perhaps'—

My reflections were brought to a sudden termination, on perceiving what had caused the stampede of the deer. It was neither bear nor lynx, but a human being.

A man was just emerging from out the dark shadow of the cypresses. The sun as yet only touched the tops of the trees; but there was light enough below to enable me to make out the figure of a man—still more to recognise the individual. It was neither Ringgold nor Hickman, nor yet an Indian. The dress I knew well—the blue cottonade trousers, the striped shirt, and palmetto hat. The dress was that worn by our woodman. The man was Yellow Jake.

CHAPTER V.

THE MULATTO AND HIS FOLLOWER.

Not without some surprise did I make this discovery. What was the mulatto doing in the woods at such an hour? It was not his habit to be so thrifty; on the contrary, it was difficult to rouse him to his daily work. He was not a hunter—had no taste for it. I never saw him go after game—though, from being always in the woods, he was well acquainted with the haunts and habits of every animal that dwelt there. What was he doing abroad on this particular morning?

I remained on my perch to watch him, at the same time keeping an eye upon the deer.

It soon became evident that the mulatto was not after these; for, on coming out of the timber, he turned along its edge, in a direction opposite to that in which the deer had gone. He went straight towards the gap that led into the maize-field.

I noticed that he moved slowly and in a crouching attitude. I thought there was some object near his feet: it appeared to be a dog, but a very small one. Perhaps an opossum, thought I. It was of whitish colour, as these creatures are; but in the distance I could not distinguish between an opossum and a puppy. I fancied, however, that it was the pouched

animal; that he had caught it in the woods, and was leading it along in a string.

There was nothing remarkable or improbable in all this behaviour. The mulatto may have discovered an opossum-cave the day before, and set a trap for the animal. It may have been caught in the night, and he was now on his way home with it. The only point that surprised me was, that the fellow had turned hunter; but I explained this upon another hypothesis. I remembered how fond the negroes are of the flesh of the opossum, and Yellow Jake was no exception to the rule. Perhaps he had seen the day before, that this one could be easily obtained, and had resolved upon having a roast?

But why was he not carrying it in a proper manner? He appeared to be leading or dragging it rather—for I knew the creature would not be led—and every now and then I observed him stoop towards it, as if caressing it!

I was puzzled; it could not be an opossum.

I watched the man narrowly till he arrived opposite the gap in the fence. I expected to see him step over the bars—since through the maize-field was the nearest way to the house. Certainly he entered the field; but, to my astonishment, instead of climbing over in the usual manner, I saw him take out bar after bar, down to the very lowest. I observed, moreover, that he flung the bars to one side, leaving the gap quite open!

He then passed through, and entering among the corn, in the same crouching attitude, disappeared behind the broad blades of the young maize-plants.

For a while I saw no more of him, or the white object that he 'toated' along with him in such a singular fashion.

I turned my attention to the deer: they had got over their alarm, and had halted near the middle of the savanna, where they were now quietly browsing.

But I could not help pondering upon the eccentric manœuvres I had just been witness of; and once more I bent my eyes toward the place, where I had last seen the mulatto.

He was still among the maize-plants. I could see nothing of him; but at that moment my eyes rested upon an object that filled me with fresh surprise.

Just at the point where Yellow Jake had emerged from the woods, something else appeared in motion—also coming out into the open savanna. It was a dark object, and from its prostrate attitude, resembled a man crawling forward upon his hands, and dragging his limbs after him.

For a moment or two, I believed it to be a man—not a white man—but a negro or an Indian. The tactics were Indian, but we were at peace with these people, and why should one of them be thus trailing the mulatto? I say 'trailing,' for the attitude and motions, of whatever creature I saw, plainly indicated that it was following upon the track which Yellow Jake had just passed over.

Was it Black Jake who was after him?

This idea came suddenly into my mind: I remembered the *vendetta* that existed between them; I remembered the conflict in which Yellow Jake had used his knife. True, he had been punished, but not by Black Jake himself. Was the latter now seeking to revenge himself in person?

This might have appeared the easiest explanation of the scene that was mystifying me; had it not been for the improbability of the black acting in such a manner. I could not think that the noble fellow would seek any mean mode of retaliation, however revengeful he might feel against one who had so basely attacked him. It was not in keeping with his character. No. It could not be he who was crawling out of the bushes.

Nor he, nor any one.

At that moment, the golden sun flashed over the savanna. His beams glanced along the green-sward, lighting the trees to their bases. The dark form emerged out of the shadow, and turned head towards the maize-field. The long prostrate body glittered under the sun with a sheen like scaled armour. It was easily recognised. It was not negro—not Indian—not human: it was the hideous form of an alligator!

THE LABOURER AND HIS HIRE.

My friend, Beaudesert, has detected a vein of poetry in the depths of his soul, and undoubtedly possesses considerable talent for mooning and reverie. He opines that the votaries of song are inadequately remunerated by an ungrateful public. The case of mankind, according to his account, is desperate; for how can they become regenerated in the face of the fact, that an epic of high merit does not pay its expenses of production? Although Mr Beaudesert usually expresses this sentiment in general terms, he is supposed to allude to a certain poem in the Spenserian stanza, by Aubrey B—, which has not reached a second edition. On the other hand, Robert Short, Esq., another friend of mine, conversant with cotton fabrics and hosiery goods, observes that B— is not obliged to write epics unless he likes; that if such and such a thing is wanted, such and such a thing will be paid for according to its market-value; and that he sees no reason why people should make more fuss about a knack for rhyming, than about thorough acquaintance with useful goods, which hold their colours and wear well. I am happy to find that both gentlemen are agreed upon one point—namely, that musical talent is often exorbitantly overrated; and the whole circle of our acquaintance, with the exception of a gentleman whose son is in the Foreign Office, is of opinion that the salaries of some public servants cannot be reasonably complained of by those fortunate officials. Of course, the expression of these sentiments has given rise to discussion; and it seems a pretty prevalent doctrine relative to the wages of head-work, that 'it's all luck.' For my own part, I do not shut my eyes to the importance of being born with a spoon made of one of the nobler metals in one's mouth; but after making allowance for caprice of fortune, general laws are manifest; and it certainly appears that labour of different kinds is remunerated at very different rates, and not always in proportion to its absolute importance. The point of view from which this fact is contemplated, varies with temperament. Some are apt to estimate the absolute value of a thing by its market-price; others seek to adjust the market-price to the absolute value. The one class sneers at the thinker; the other underrates the practical man.

The greater part of labour and capital are employed, directly or indirectly, in satisfying physical requirements; and the usual wages of labour and profits of capital are accordingly determined by the extent of those requirements, and the means which the community possesses of giving *quid pro quo*. Trade and productive industry, or labour having for its end the practically useful, is of all labour most widely and steadily appreciated. In fact, although 'what we are imports us more than what we eat,' the lower wants of man's nature are prior to the higher. Amongst practical pursuits, therefore, and the professions which depend on them, every citizen has a certain power of selection; and 'choosing a career' is always an important topic of discussion in family circles. It may be remarked, however, generally, that ordinary occupations are adopted from the sheer necessity of earning bread and cheese, and not from irrepressible bent of mind urging men to activity in a given direction. Although a certain retired tallow-chandler, impelled by force of habit, and the strong necessity of occupying himself,

asked leave to busy himself gratuitously on melting-days; nevertheless, most men, provided they had ample means, and were not habituated to a certain routine, would decline to follow that or any other calling in the beaten road of life. Without, then, meaning anything derogatory to honest work, rather remembering the *laborare est orare* of the monks, I assert it to be literally true, that the ordinary callings of men are mercenary in their aim: wages are the inducement to toil.

When, however, we pass to those occupations the object of which is to gratify sensuous tastes, we find they are taken up very much in obedience to natural bias. It is of course impossible, in the present complicated state of society, to draw sharp lines of demarcation between the different provinces of human labour. The sensuous wants of man, however, comprise music, dancing, theatrical amusements, and in some part poetry, together with the ornamental arts generally. Since the professors of these arts cultivate them from natural liking, and in a great many cases would pursue them without substantial reward if they were possessed of independent means of living, it is clearly not necessary, in order to secure a sufficient number of recruits, that they should be rewarded according to the rates of purely mercenary callings. Hence, such of this class as possess no more talent than many who have adopted more homely callings, receive less remuneration than they might have received in other walks of life. Those, again, who are gifted with brilliant talents, succeed in obtaining no insignificant reward; for the arts they cultivate are patronised by a large and increasing portion of the community, and afford pleasure and profit to the individuals composing it. Adam Smith points out that a butcher is remunerated at a higher rate than other artisans, because his occupation is none of the pleasantest. This principle applies to the case we are discussing, and still more forcibly to the case which we will next consider—namely, that of the class which supplies the spiritual needs of man—spiritual needs as opposed to his physical and sensuous wants.

This class of labourers also adopt their several professions from personal bent of mind. Indeed, these pursuits are apparently so opposite in aim to those which are practical, that it is considered almost disgraceful to follow them from mere mercenary motives. Professors of thinking, therefore, who possess only little more than the average ability of cultivated men, receive less remuneration than the corresponding class, who devote themselves to sensuous arts. Yet, in this case too, if the wants supplied are popular and general, the reward is by no means niggardly. Popular men of genius are successful even in point of earnings, for the amount of their profits has been greatly augmented by the spread of popular refinement, and where formerly chief reliance was placed on some wealthy or influential patron, the patronage of the public has been found amply sufficient. There still remains, however, a large class of intellectual pursuits which appeal to only a small portion of the community, chiefly to those engaged in kindred labours. In these cases, it becomes a question whether the patronage of government can be entirely withdrawn with security and propriety. Professors of science, learning, and philosophy are generally dependent for their means of living on that part of their occupation which is immediately beneficial. They are not enabled to devote their whole time to exploring the remote regions of thought, but are expected to make themselves useful in education or practical life. Nor, perhaps, is this to be complained of, for it frequently happens that those are best fitted to bring into practical bearing the results of science and learning, who have penetrated their furthest depths.

Several circumstances combine to render abstract

studies unremunerative in a pecuniary sense. In all original investigations, a great deal of labour is unavoidably lost, and the public will not pay for abortive labour if it can possibly avoid the outlay. In the next place, from the very nature of those pursuits, their essential value cannot become recognised and notorious until an extremely high point of popular cultivation is attained. The demand comes after the supply. The public cannot generally appreciate the inception of a science or discovery of an abstract truth. To most men, a bale of goods is an object of greater interest than a new theorem. It is, moreover, unfortunately too true that people do not set themselves rigorously to inquire whence a useful invention derived its origin. They pay for it just as much as they are compelled to by those who furnish its practical application; and the system of patents can only partially remedy this unavoidable injustice. The necessary stringency of patent and copyright laws, shews how little the public can be depended on for a just distribution of reward. We esteem it a very praiseworthy exhibition of charity, when an original discoverer, out of whose hands an invention has been taken, is recompensed by a purse, or his poverty-stricken descendants are redeemed from utter destitution.

As human nature is constituted, it is in vain to expect the highest interests of humanity to take up their true relative position. We might as well expect a schoolboy to pay his master out of his pocket-money, as that mankind should labour in order to remunerate those who devote themselves to their instruction. The professors of religion may seem, on a superficial view, to be an exception to this rule. The annual revenues devoted to their support are indeed enormous in the aggregate, and a successful career in the church is not to be sneered at by a prosperous cotton-spinner, or counsel learned in the law; but a little reflection will shew that, in truth, this is no exception. Wherever what is called the 'voluntary principle' is working, the salaries of ministers of religion are less than those of confidential clerks or expert salesmen. With respect to established churches, the greater part of their revenues were devoted to their service in times when superstitious fear and frantic fanaticism mingled largely with healthy faith, and placed men in an abnormal position. Much is thus accounted for, and when we add to these considerations the fact, that of all instincts in man, religion is perhaps the strongest, the whole phenomenon is adequately explained.

Thinkers of the highest class will readily acknowledge, that even the strictest justice and most enlightened reverence for their vocation, do not require their remuneration in pounds, shillings, and pence to equal that of merchants, manufacturers, and professional men. They would readily admit that competency, not wealth, is all they have a claim to. To render the vocations of the poet, scholar, and philosopher so many modes of accumulating fortunes, would be to degrade them. After all, honour, respect, and affection are no mean rewards when they are added to suitable means of livelihood. Beyond a certain point—dependent, of course, on social position and habitual mode of life—wealth, to the low-minded, is mere display, and to the high-minded, is full of responsibility. It is always rash to complain of the necessary nature of things. The adaptation of different modes of life to the exigencies of society, is better than the human intellect, guided by the best social virtues, could *a priori* invent. There is room for improvement, as there is in everything partially human; and for praise, as there is in everything partially divine.

Labour is the honourable lot of man, and by a beautiful adaptation of his nature, idleness is irksome to him. Each in his station, without the aid of brilliant gifts or accidental advantages, may render his

life useful and happy according to the measure of human happiness. And though the healthy desire to raise a family well and usefully, and provide for declining years, too often degenerates into a morbid thirst for riches, the general beneficence of the law is manifest in the industrial progress of mankind. Nor would it be becoming in those who are permitted to exercise their highest faculties, and devote their best energies to working out and unravelling the beautiful, good, and true, to grudge to life's more homely wayfarers such solace and satisfaction as wealth can afford. We all know that a pittance granted in love is better than a liberal allowance grudgingly bestowed. And it is equally certain that we individually benefit strangers in a pecuniary point of view more than those nearest to our hearts. 'Among eminent persons, those who are most dear to men are not of the class which the economist calls producers; they have nothing in their hands; they have not cultivated corn, nor made bread; they have not led out a colony, nor invented a loom.' We should be wrong, too, if we permitted ourselves to estimate the happiness and wellbeing of the different classes of men by their affluence. After Sir Humphry Davy became famous, he contemplated resuming the medical profession; his better genius prevailed, and he remained a philosopher in moderate circumstances, instead of becoming a wealthy physician. When urged by a friend to take out a patent for his safety-lamps, he declined to do so, saying: 'I could then only put four horses to my carriage; and what would it avail me that people should say: Sir Humphry drives a carriage-and-four.'

Whether or not we patiently acquiesce in the appointed order of things, is a matter for our own consideration. Certainly, the great laws which have made the history of man will remain in force; there is no sign or token that a day of change is near. The highest developments of character belong to a scanty minority. The great poets, scholars, or philosophers must still be content with fit audience, though few, and reap a scanty harvest of material prosperity. And yet the world need not despair of great men that will do its work, develop its resources, and reform its life. If there is no demand for calicoes, calicoes will cease to be; the trade of coach-building goes down as the lines of rail lengthen. Not so with the intellectual and imaginative arts. Poets will sing, though none should listen; astronomers would point their glasses heavenward, though it were a penal offence; some few will speak of the great realities of life and the soul, though death should be their guerdon. Genius will serve mankind in spite of itself. Such is the ordained strength of the spiritual element in the human race, that no obstacle which human ignorance may raise can stay human advancement. If it were not so, philanthropists might well be dismayed. There is a divine event, whereto all things tend, and nothing can render it uncertain. Men may yet come to acknowledge that money-value is not a universal standard; and the representatives of Alexander and Diogenes may learn mutually to acknowledge the work of life.

BREAKING-UP À LA FRANÇAISE.

'Ce 19 Août 184-.

MADAME BIDAMONT DE ST MAUR présente ses complimens à Monsieur et Madame Smith, et les prie de vouloir bien lui faire l'honneur d'assister à la distribution des prix, qui aura lieu chez elle le Jeudi 21 Août, à sept heures et demie du soir.

8 bis, Avenue des Demoiselles, Champs Elysées.'

Such, as nearly as I can remember, were the contents of a slim little note, addressed 'Monsieur Smith, Esquire, Avocat, Hôtel des Bouleognes Britanniques,' which Mrs Smith and I found on our breakfast-table at the above-mentioned comfortable establishment, the

morning after our arrival in Paris, on our way to Switzerland, where we proposed spending my long vacation. For the benefit of those of my readers who may happen to be worse French scholars than myself—if there be any such—I may translate the missive as follows: 'Madame Bidamont de St Maur presents her compliments to Mr and Mrs Smith, and requests them to do her the honour to assist at the distribution of prizes, which will take place at her house on Thursday, the 21st of August, at half-past seven in the evening.'

Now, my knowledge of Madame Bidamont de St Maur, who was the mistress of one of the most fashionable 'establishments for young ladies' in Paris, was very slight; but she knew enough of me to be aware of the fact, that I had a couple of nieces for whom she would be very glad to find room; and therefore, having a keen eye for business, she was most desirous of improving our acquaintance. Hearing, then, by chance, from a mutual friend, of our arrival in Paris, she hastened to send us an invitation to be present at her 'distribution,' or 'breaking-up;' trusting to produce such an impression on us by what we should there see and hear, as to further very materially the object she had so much at heart.

'Oh, do go, Frank. I should so like to see how they manage these things in Paris. Emily Brown, you know, went to one of those advertising schools near Calais, and she says that the distribution of prizes was very amusing even there. Besides, as your brother thinks of sending his girls to school here, we may be able to gain information which will be valuable to him. Do let us go.'

And so it was decided, partly from curiosity, and partly from the desire of picking up all the knowledge we could of French schools, that we should accept madame's invitation; though not without some grumbling on my part at the loss of two days, for what I prognosticated would prove to me at least a very slow affair. This decision being come to, it was necessary to concoct an affirmative reply to Madame Bidamont de St Maur's note, and this at first seemed likely to prove rather a formidable undertaking—neither of us liking to venture on the composition of a French letter. A happy thought, however, got us out of the difficulty. Hurrying to the Palais Royal, I invested three francs fifty centimes in the purchase of a polyglot *Libre de Poche pour Voyageurs*, at the end of which we found, as I had anticipated, several forms of invitations and replies thereto, adapted to the requirements of polite society. Selecting the form which appeared to us the most appropriate, we filled in and despatched the following note:

'Ce 20 Août 184-.

Monsieur et Madame Smith font leurs respectueux compliments à Madame Bidamont de St Maur, et ils auront l'honneur de se rendre avec autant d'empressement que de plaisir à son aimable invitation.

Hôtel des Bouleddogues Britanniques.'

Anglicé: 'Mr and Mrs — make their respectful compliments to Madame —, and they will have the honour to render themselves with as much of eagerness as of pleasure to her amiable invitation.' At least such was the English version of the form of acceptance given in the *Travellers' Pocket-book* I had just purchased.

The number of vehicles of all sorts, public and private, which we found setting down company at Numéro 8 bis, Avenue des Demoiselles, when we arrived there on the following evening, shewed us that the gathering together of papas and mamas and sympathising friends would be a large one at any rate; and that if dull, as I feared, it would not be so on account of the paucity of spectators. The anteroom also was crowded with parents and relatives of every degree of consanguinity, from third-cousin up to grand-

papas and grandmamas; some of the latter, by the by, not answering at all to the popular idea of a grandame, being very fashionably dressed, and much more youthful in appearance than grandmothers of children nine or ten years of age usually are, at least with us. When our mothers and grandmothers marry as soon as they leave school, perhaps at sixteen, it is not impossible that we should remember our 'grannams,' not only as the dispensers of plum-cake, lollipops, and half-crowns, but as very fine women.

Ushered into the presence of Madame Bidamont de St Maur by the name, style, and title of 'Monsieur et Madame Smit,' that lady received us with one of her most winning smiles, and, declaring that she was 'charmée' to see us—as, remembering that I had two nieces, no doubt she was—and that we were 'bien bons' to come, conducted us to seats from which we could both see and hear everything that passed. It was essential to the success of her plan that 'Monsieur et Madame Smit' should be well placed.

The apartment—a long and wide gallery leading to the various class-rooms—had been charmingly decorated for the occasion. Instead of the unmeaning bundles of half-withered evergreens stuck about the walls in the style of a village club-room on 'club-day,' in which clownish, unclassical fashion we used to ornament the school-room at Dr Birchem's, on the last day of every 'half'—festoons of artificial flowers hung gracefully from column to column, and along the line of tall windows, contrasting prettily with the white drapery. A profusion of waxlights, artistically disposed, displayed the appropriate decorations to the best advantage; and in short, guided by madame's correct taste and eye for effect, the gallery had been converted, by the willing hands of the *pensionnaires*, into an elegant reception-room. The placing, too, of the performers and spectators was conducive to effect. At one end of the room, several rows of benches, covered with scarlet cloth, and raised one above another, were reserved for the 'young ladies;' while three rows of seats, placed on either side of the gallery, were already crowded with the company invited. At the other end of the apartment stood a table, on which were displayed a large number of gaily-bound books and other prizes, together with the ivy wreaths with which every successful pupil was to be *couronnée* in the sight of the admiring and applauding spectators of the solemnity. On a cushion by itself, lay a wreath of pure white roses, destined, as we afterwards found, to be the reward of the best-behaved and best-loved girl in the school.

But I ought to say a few words on the appearance and bearing of Madame Bidamont de St Maur herself. She looked and acted her part to perfection. A buxom widow of forty, she had by no means laid aside her pretensions to good looks, for she was still handsome—skilful millinery contending successfully with the first approaches of the destroyer, Time. She was dressed richly, and in perfect taste, but soberly, as became the mistress of a place of education; and as she gracefully welcomed each new arrival, smiling and bowing how *charmée* she was to see them, no doubt she impressed her visitors with the belief that she was a very amiable, *comme-il-faut* person, qualified in every respect to superintend the education of young ladies destined to live in the most artificial society in the world.

A glance at the programme of the evening's proceedings shewed that madame's endeavours were seconded by an ample staff of professors. The programme set forth the names and qualities of all the professors who taught at 'Numéro 8 bis,' as well as the order of the entertainment provided for us; and it appeared that, if Madame Bidamont de St Maur, besides exercising a general superintendence, had merely confined herself to the department of 'manners,'

ample care had been taken for the instruction of her pupils in other branches of polite female education. The professorial power of the establishment in the Rue des Demoiselles was immense; and the little army of gentlemen in white cravats and spectacles—all the literary gentlemen wore gold spectacles—was enough to make one feel learned and accomplished to look at them. There was 'Monsieur le Professeur de Littérature Française,' a bald-headed little man, evidently duly impressed with a sense of his own importance, and bursting with the *beau discours* which it would be his duty and delight shortly to pronounce. There was 'Monsieur le Professeur de Géographie et Cosmographie,' whose duty it was that evening to look wise, which he did—as an owl in spectacles. There were 'Messieurs les Professeurs' of History, of Natural Philosophy, of Writing and Arithmetic, of English, of Italian, and of German; of the Piano, of the Harp, and of Singing; of Drawing, of Dancing, and even of 'Gymnastique,' which latter functionary was habited in the uniform of an officer of the 'Sapeurs-Pompiers,' and displayed on his well-stuffed breast the cross of the Legion of Honour. Nor must I forget to mention the gentleman—although his name did not appear amongst the list of professors—whose business it was to conduct the religious instruction of the pupils, and who prepared them for the examinations of 'Monsieur le Curé' himself. He appeared to be a kind of 'Professeur de Religion,' I suppose of the orthodox faith of the country; but I cannot help believing that Madame Bidamont de St Maur, rather than lose a pupil, would have undertaken that he should have catechised in any religion required, even if it were that of a Turk or a Hindoo. *La religion*, at Number 8, was regarded, I fancy, pretty much in the same light as *la danse*, *la gymnastique*, or any other *étude*. The keeper and director of all the consciences of the establishment, the curé of the parish, was also present, and appeared to enjoy himself as much as anybody. No doubt, the *distributions des prix* at the ladies' schools to which he was invited, were looked forward to by him almost as joyfully as by the girls themselves. On all other occasions, his profession forbade him to be present at a *soirée* where he might enjoy the society of the fair sex.

Madame Bidamont de St Maur now takes her seat on one side of the table on which are displayed the various prizes, supported by Monsieur le Professeur de Littérature Française on the other. The smiling curé places himself on her right hand, the professors and teachers group themselves around, and, at a given signal, the 'young ladies'—between sixty and seventy in number—enter in due order. They are as well drilled as a *corps-de-ballet*, and are all dressed precisely alike in white muslin; each class being distinguished by broad sashes and bands across the shoulders of different coloured ribbons. They enter two and two, beginning with the youngest, and gradually rising to the 'finished' young lady, who, in all probability, has a *bon parti*, a desirable match, looked out for her as soon as she reaches home. Each pair formally salute the company, and then, dropping two folded papers into a gilt urn placed ready to receive them, take their places on the crimson-covered benches. When all are seated, the spectacle is as charming as the eye need to look upon. The many-coloured ribbons which served to distinguish the classes, divided the mass of white muslin, and the crowd of fresh young faces, into parterres as brilliant as ever the most cunning gardener could devise. The gayest beds of tulips and ranunculuses would have lost by comparison with them. Madame Bidamont de St Maur had already made a hit. The drilling and dressing had answered the purpose intended. All the mammas, by a process of ratiocination peculiar to the maternal mind, put the effect the young ladies produced in the aggregate

down to the sole credit of their own daughters; and were therefore more than ever convinced that madame was a most charming woman.

We had been greatly mystified by the dropping of the folded pieces of paper into the gilt urn, but the explanation was at hand. As soon as the last paper had been deposited, the urn was carried to the table, at which sat madame and the professor, and its contents being emptied out, the voting papers—for such they were—were examined and counted by them. The pupil who had gained the most votes was to be presented with the *couronne blanche*—the prize for good conduct, to be by her worn during the evening. This prize, by which it was intended to reward and honour the most amiable girl in the school, the girl best loved by her companions, and the girl whom we should call 'the best behaved'—not the cleverest—was not conferred, nominally at least, by the favour of madame; or after grave consultations, like many of the other prizes, between Monsieur le Curé and several of the gentlemen in spectacles. The *couronne blanche* was awarded by the girls themselves; and as Madame Bidamont de St Maur never failed to turn to the best account every opportunity of producing a dramatic effect, the election took place by universal suffrage and vote by ballot, on the evening of the distribution. Whether these panaceas for all the ills which humanity, political and administrative, is heir to, secured the placing of the right girl in the right place on this occasion, is more than I will undertake to say. It may be also that the secrets of the urn were not so well kept as our ballot society would desire, and that, after all, the election was more or less the result of 'legitimate influence.' All I know for certain is, that the learned professor, after carefully counting the voting papers, declared that the choice of the electors had fallen on Mademoiselle Blanche de Bonneval; and that a very pretty girl, answering to that name, rose from her place, and advanced, blushing, to the table, amidst the unanimous plaudits of the spectators. The *couronne blanche* was handed to her with a few kind expressions, by no less a personage than Monsieur le Curé; and then, kneeling at the feet of Madame Bidamont de St Maur, the much-coveted wreath was fastened on her brow by that lady, who, affectionately embracing her, sent her back, more deeply blushing, and still more loudly applauded, to her constituents. As I have said, there may have been legitimate influence at work in spite of universal suffrage and the ballot; and, at the best, it is more than probable that the contest gave rise to petty jealousies and heart-burnings, and intrigues amongst the white-robed electors. But the effect of the election and the crowning of the chosen one was admirable. Madame Bidamont de St Maur may have waked feelings in the hearts of some of her pupils which would have been roused only too soon by contact with the world, but she had made another decided hit.

The choosing of the *couronne blanche* being thus concluded with all the *éclat* that could be desired, the young ladies displayed their musical accomplishments in a concert at which they were the sole performers. It commenced with a *grand chœur*, in which some thirty or forty of the girls took part, and which had been composed expressly for the occasion—the words by Monsieur le Professeur de Littérature Française, and the music by Monsieur le Professeur de Chant. The latter professor of course presided at the piano, and had every reason to be contented with the effect of his composition. Indeed, nothing could be prettier in its way than the effect produced by the fresh and well-trained voices of his pupils. As to the part which the other professor had had in this chorus—the words—from the few which reached my Britannic tympanum with sufficient distinctness for comprehension, I judge that the opportunity for a puff had not been

vasted; and that the chorus were made to sing of the delights of study in general, and of the merits of 'Numéro 8 bis' in particular. The chorus was followed by a solo on the harp, a nervous affair for the poor soloist; for when performing on this instrument, there is no possibility of half hiding one's self behind the music. The harpist is exposed from head to foot to the criticism of the company, and inelegance in playing is almost as fatal as want of skill. Madame Bidamont de St Maur, however, prided herself above all things on imparting elegance of manner to her pupils, and the *pose* of such of them as learned to play on the harp was especially attended to. On this occasion, both grace and talent were conspicuous in the harpist, who was no other than the pretty *couronne blanche*. She fully merited the hearty round of applause which she received when she courtesied and made way for a stately, dark-eyed girl, with a tragic cast of countenance, the *prima donna* of the *pension*, and the pet pupil of Monsieur le Professeur de Chant. Great things were expected of this damsel, and expectation was not disappointed. Her style of singing was certainly not to my taste, but I was in a woful minority on that question; for when this *prima donna* of sixteen, by the aid of a violent jerk of the head, a frightful contortion of the mouth, and a sudden straightening of the arms, got up as high as *do*—my wife said it was *do*—the whole room burst into a storm of acclamations, and the face of Monsieur le Professeur de Chant absolutely beamed with delight. The *prima donna* was the trump card in the vocal department of the concert; but a charming little *blonde* who sang next, pleased me infinitely more. She sang a simple ballad with taste and feeling, and, to my mind, was not half so much applauded as she deserved to be.

But the great hit in the concert, not even excepting the roudades, the screams, and the contortions of the *prima donna*, was the *morceau* with which it concluded. This was a 'grande fantasia pour six pianos et douze executantes'—a grand fantasia for six pianos and twelve performers, arranged expressly for this solemnity by Monsieur le Professeur de Piano. Half-a-dozen cottage pianos—we may thank Heaven they were not *grands*—are wheeled from the adjoining rooms, and ranged back to back in the centre of the gallery, like line-of-battle ships prepared for action. Twelve music-stools are placed before them; a dozen pensionnaires take their seats thereon, and twelve pair of hands, ninety-six crooked fingers, and four-and-twenty bent thumbs suspended over the key-boards, await but the signal to commence the attack. As Monsieur le Professeur de Piano takes his place between the two lines of instruments, curiosity is at its height. The stillness is like the breathless silence we hear of as usual just before hostile fleets open on one another their thousand iron throats. Monsieur le Professeur is evidently impressed with the solemnity of the moment: he taps once on the nearest piano; his white-gloved hand saws the air, up, down, and across, after the manner of musical commanders. 'Un—deux—trois—quatre; up goes the white glove, and—but what a disappointment to the ear! Instead of a terrific onslaught on the six instruments by the whole body of performers with their two dozen hands, and their ten dozen fingers and thumbs, a single hand begins *piano*, *pianissimo*, somewhere far down in the bass. Instead of the thundering broadside from every ship which we all expected with trembling curiosity, a feeble rumbling only is heard on the extreme left. Presently, however, another hand comes into play, and then another and another; one vessel after another gets into action, and soon a tremendous cannonade is kept up along both lines. Sometimes the big guns of the six basses are worked so vigorously that they completely drown the pattering musketry of the six

trebles; and sometimes the rattling of the small-arms is so sharp and quick, that it fairly dominates the heavy artillery; and thus from *pianissimo* to *piano*, from *forte* to *fortissimo*, and *ffff* *isissimo*, and far beyond what it is in the power of ordinary language musical to express, the *grand morceau* went on to its conclusion in a crash which nearly deafened the hearers. Need I say that the success was commensurate with the concluding noise? It always is so. The caterer of popular music who can contrive to make a piece end with the explosion of a powder-magazine, or the bursting of a boiler, will probably make a fortune.

The noise and fury of the *finale*, the *do* of the *prima donna*, and the pretty scene of the election of the *couronne blanche*, had put everybody in a good humour for the real business of the evening—the distribution of the prizes. At last, then, the time had arrived for Monsieur le Professeur de Littérature Française to disburden himself of the beau discours which had long weighed so heavily upon him. Adjusting his gold spectacles, he spoke, or rather *read*—a Frenchman seldom *speaks*—to the following effect.

After telling us with what pleasure he performed his duty on that occasion, because of the very favourable report he had to give of the progress made during the past year, he entered into a detailed account of what had been done by each class in each branch of study. Then, in well-rounded and sonorous phrases, he expatiated on the delights of knowledge, and reminded his young friends of the immense advantages they enjoyed at 'Numéro 8 bis, Avenue des Demoiselles,' where professors of *grand talent*, and a lady watching over them with *soins tous maternels*, were unceasingly endeavouring to accomplish the most ardent hopes of their dear parents. In short, he delivered himself of a discourse which, as he meant that it should, pleased everybody. When he alluded to the motherly care of Madame Bidamont de St Maur, and spoke of the 'sacrifices and exertions before which she would not shrink in order to assure herself of the happiness and wellbeing of her pupils,' what a capital puff it was in the ears of the anxious parents present! When he ran through the whole list of studies, from *cosmographie* to la *gymnastique*, and one big word after another rolled out of his mouth or twanged from his nose as the pronouncial exigencies of his native Gallic required, it seemed that No. 8 was a fountain of all knowledge, and a source of every fashionable accomplishment. How satisfactory, too, this report of the progress made by the pupils; how gratifying to all parties the announcement that 'this year' the conduct of all had been most satisfactory; how pleasing to find that, from the department of elementary theology—the catechism—to that of la *danse*—that elegant accomplishment more than ever necessary to those destined to mix in the brilliant society of our time—the young ladies had surpassed the expectations of their professors. No wonder that, capping his lucid statement of all these agreeable facts with a magnificent peroration, the learned professor concluded a speech more than half an hour long amidst the acclamations of all present.

Then came madame's turn to make a speech, and very well she did it too—saying, not *reading*, what she had to say in a ladylike, conversational style, which was really very pleasing to listen to. Of course, she addressed her pupils as *mes chères enfants*, and assured them how much she had their temporal and eternal welfare at heart. She had a kind word for all of them; for those who were going to leave her not to return, and for those whom she hoped to see again after the *vacances*. She flattered herself that she had earned, as she had striven to merit, their confidence and affection. She assured them of the deep interest she should always feel for them, whatever *Dieu* should

have in store for her; and wishing them all an affectionate adieu, in a voice nicely modulated to express just the fitting degree of emotion, sat down, having convinced her guests that she was not only charming and amiable, but *très spirituelle* as well. The vigour and evident heartiness with which her pupils applauded her little speech throughout, proved at any rate that she was popular with them, and that if circumstances made her worldly, her nature was not unkindly.

A flutter of expectation now ran through the ranks of the pensionnaires, for the prizes were about to be given. Madame took up a roll of paper, and saying: 'It is now my pleasing duty to announce the names of those young ladies who have been thought worthy of a reward for diligence in their various studies,' or rather the French equivalent for that phrase, the distribution of the prizes at once commenced. Each recipient, on her name being called, walked up to the table, and having been crowned with an ivy wreath, received her prize, and returned to her place. The first prize awarded in the first class was for 'Littérature Française et Style;' the second, for history; and so on to singing, dancing, and the polka. In those days, polka-ing was just coming into fashion, and the giving of a prettily dressed doll to a pretty child of seven, a great pet of the whole school, as a prize for her proficiency in this much-talked-of dance, created quite a sensation, as doubtless it was intended it should. Though, of course, not to be taken *au sérieux*, the *prix de polka* was one of the most successful strokes of the evening. The remarks which the professor of 'Littérature Française' had made as to the progress of the young ladies in their various studies, were fully borne out by the number of prizes which it had been thought advisable to award. I think that every pupil had at least one, and some had as many as half a dozen, so that they all went home rejoicing, and every mamma was more or less content.

The prizes having all been distributed, the affair, after a few more well-chosen words from madame, was over. The girls came down from their seats, and mingled with their friends and relatives. Books were eagerly held up for the inspection of admiring parents, and the little *prix de polka* became the subject of universal attention. Madame Bidamont de St Maur received on all sides well-merited compliments on the result of her exertions; and Monsieur and Madame Smit, amused rather than captivated, departed in their *ciadine* for the Hôtel des Bouledogues Britanniques.

IMPROVEMENT IN BREAD-BAKING.

A new process of bread-baking, the invention of Dr Daughlish of Malvern, is at present undergoing a course of successful experiment at the works of the Messrs Carr in Carlisle, and promises to effect at once an improvement in quality and the saving of about a tenth of material. The idea proceeded upon is not new—that has been long known, and frequently made the subject of experiment; but the process by which the theory can be successfully reduced to practice is now for the first time brought forward.

When the dough, mixed with yeast, under the old system, is placed in a warm atmosphere, in an hour or two it begins to rise or swell, in consequence of a portion of its starch being converted into sugar, and this changed into alcohol and carbonic acid. The gas permeates the dough, forming, in its efforts to escape, little cells, where it is imprisoned by the tenacity of the gluten, which forms about 10 per cent. of fine flour. It is this mechanical peculiarity of wheaten flour which has made it the chief food of mankind.

Rye, although of nearly the same composition, has less tenacity in the gluten, and the bread made from it has therefore less lightness; while oatmeal, although much richer in gluten than fine wheaten flour, has so little tenacity as to be quite incapable of being baked into a spongy loaf at all.

When the dough is placed in the oven, the fermentation goes on more rapidly; the little cells grow into large bubbles; the alcohol escapes and is dissipated; till at length, when the heat is about the boiling-point, it kills the yeast, and the fermentation is suddenly at an end. The use of the yeast is to evolve gas in order to give lightness to the bread; but this, we see, it can do only at the expense of the dough, by first converting a portion of its starch into sugar.

To save this waste, it was necessary to charge the dough with ready-made (carbonic acid) gas, instead of making the gas of its own substance; and this was repeatedly tried by mixing the flour with aerated water, but with no good result, since, in the very act of mixing, the gas escaped. In this stage of the business, Dr Daughlish conceived the idea of employing, in the operation of mixing, sufficient pressure to prevent the escape of the gas. This, in point of fact, is his invention; but a vast deal of patient ingenuity was required to make it work practically. In a well-written article on the subject in a local paper, the *Carlisle Examiner*, the following account is given of the apparatus and its action: 'The apparatus constructed at the works in Caldewgate consists of the ordinary gas generator and holder used by soda-water makers, and of a set of powerful pumps, for forcing the gas into the water contained in a condenser; also, for pumping a pressure—that is, a volume of gas—into a kneading or mixing vessel, which is a strong iron globe, capable of containing more than two sacks of flour, and furnished with arms revolving by steam-power. To work the apparatus, flour is put into the mixer, and water into the condenser, the pumps set to work, and, when sufficient gas has been pumped into these vessels, the water is let into the mixer, and the arms set agoing. In eight minutes, the dough is mixed. The pressure is then let off, and the dough rises instantaneously. Thus, in about half an hour, the usually tedious and uncertain process of bread-making has been accomplished, and there has also been effected the saving of that precious tenth of nutritious matter which would have been wasted in exhalation, or by conversion into alcohol. The baker is delivered from the hard necessity of setting his bread at night, and watching for its rising in the morning. Alternations of cold and heat are rendered powerless over the heaviness or lightness of our breakfast-loaves. Time, labour, and material are saved, and thus bread rendered both purer and cheaper.'

But there is something of importance in bread-making besides raising the dough. The oven must be constructed on a good principle, or every other advantage will, to a certain extent, be lost. Our present oven has come down to us as an heirloom from our ancestors, and we have never thought of examining it by the lights of science. In the Carlisle experiments, however, it was found that the bread, however artistically made by the new process, was not invariably what might have been expected, and this led to an inquiry into the principle of the oven. It was discovered that the heated vaults we use for the purpose, in which the heat radiates *down* upon the bread, are unfavourable to lightness; whereas in Paris and Vienna, where the heat *rises* from the bottom, and

passes through the loaf, the top-crust is soft, and the bread as spongy as is desirable. On this latter principle, therefore—new, we believe, in England—the ovens were constructed for the unfermented bread.

We may add, as something that will appear curious to many of our readers, that 'the *bulk* of light bread—or rather, the space it fills—is but one-sixth solid matter, and five-sixths aërial, and that, consequently, very high pressures are needed to make such light bread.' These pressures, however, are so effectual by the new process, that even when the dough is rolled out into biscuit, it retains the gas in minute cells, and thus a novel and superior kind of bread is produced under a familiar name. This has struck Messrs Carr & Co. so much, that we believe it is their intention to confine the use of the apparatus to their original occupation—the manufacture of biscuit; although their doing so will not exclude the public from the advantage of the invention in their daily bread, since it is Dr Daughlish's intention to treat liberally with all who desire to avail themselves of his patent.

THE BLUE CAVE.

WHOEVER has travelled much in the south, must have necessarily made the observation, that in certain states of the atmosphere everything around you appears startlingly unreal. Here, in the north, the world has a substantial aspect about it. You look upon it, you touch it, and you are fully persuaded of its permanence and solidity. But as you approach the extremity of the temperate zone, you often appear to be floating through a delusive creation, which expands, and gleams, and scintillates about you; now immersed in light, now enveloped with shadow; now contracting, now dilating, until your imagination becomes a prey to a sort of dim scepticism independent altogether of reason. At all events, this is what I myself have often experienced, when hovering in dreamy abstraction about the shores north and south of the Mediterranean. Our existence is divided everywhere into two very distinct parts—the life of the day, and the life of the night—which, to the least poetical and fanciful of our species, must necessarily be distinguished by striking contrasts from each other.

I had a friend at Naples, somewhat old even when we first met, who seemed in his experience to have reversed the great principles of life. Having been solid, logical, and somewhat material in his youth, he had become romantic and imaginative as he advanced in years. To him, nothing was so delightful as to contemplate the universe as a sort of diversified mirage, moulded by the plastic power of the soul into infinite variety, and stretched out like a fantastic picture beneath the moon. Lazy people are everywhere the best adapted to keep alive this sort of dreamy propensity; and the Neapolitans being pre-eminently lazy, my worthy friend found the paradise of his fancy in the Bay of Naples, where, with a couple of boatmen at his command, he used frequently to put forth soon after nightfall, and move about in silence over the gleaming waters, and between those lofty and fantastic islands which, studding the whole distance from Misene to Sorrento, cut off the Bay from the Mediterranean. During my stay, I accompanied him more than once on these moonlight excursions.

The doctor—for my friend had studied divinity, and risen to a high position in the church—was, in spite of his profession and the duties it devolved upon him, considerably more than half a pagan; not as scholars often are, through a mere learned deference to the freaks of the imagination, but from genuine, unsophis-

ticated superstition. I would not maintain upon oath that he believed absolutely in Orcus and the Sybil; but there were ideas in his mind, connected with ancient creeds, which dominated all his thoughts, and imparted a peculiar colour to his faith. Our two boatmen—which, however, is no marvel—were to the full as much under the influence of ancient superstitions as himself. Paganism had come down to them as a sort of secret inheritance, of light or darkness penetrating through their everyday belief, until it reach much further down into their minds, where it underlay all their notions and imaginings, and impressed upon their characters an extremely peculiar stamp. They were afraid of the night, afraid of the moon, afraid of the shadowy figures which the wood-crowned islands threw here and there upon the surface of the deep. It seemed to them that by disturbing at such hours the gentle ripples with our oars, we were guilty of something like sacrilege, towards what power they could not tell, or would not, for perhaps in their hearts they had familiarised their apprehensions much more distinctly than they chose to acknowledge. Nemesis bears a wide away over the earth, but more especially enfolds the Mediterranean with her broad wings. There she resumes every night her ancient empire, and makes the hearts of all who go abroad beneath the sky pant and thrill with a consciousness of her presence.

We had just rowed by Castel-a-mare, when the doctor—a sudden thought apparently striking him—turned round to me and said: 'You mentioned to me yesterday that you had never visited the Blue Cave. Let us do so now. The play of colours is more marvellous by day; but the sense of solitude, the silence, the mingling of light and shadow, the movement and murmur of the half-fabulous water, will be more exciting, more charming by far at this delicious hour.'

I assented readily, and we moved on. It is no doubt very common to imagine at such times that the boat in which we sit forms the point of contact between two universes—the universe above, and the counterpart of the same universe below—and that we are upheld and borne along by we know not what power between these two systems of existence; touching neither, mingling with neither, yet powerfully acted upon by the influences of both. The water was still and smooth as glass, and seemingly far more transparent. We looked down into it, and far away in its unfathomable depths beheld moon and planets, and constellations flinging towards each other their golden light, until the concave was one blaze of splendour. Above, the eye was encountered by the same phenomena. For a while, no one uttered a word. The sailors moved backwards and forwards; the oars dipped, bright drops, like showers of molten pearl, rained over them as they ascended into the air; the boat moved forward, and shores, woods, islands flew past as in the panorama of a dream. Here and there, a long way off, lights twinkled between the trees; and as we moved among the islands, vast piles of masonry like prisons rose high among the rocks. I was not ignorant that thousands of brave hearts, in anguish and bitterness, were at that very moment throbbing freely within. Their owners had dared to dream of improving the social condition of their countrymen, and this, in most parts of the world, being a crime, they were expiating their proud fancies upon an insufficient supply of bread and water in those dungeons. But under the inspiration of the picturesque, we sometimes become hard-hearted, or else discover the knack of escaping from painful topics to enjoy the beauty that is before us. At anyrate, we were not so sad as might have been expected, and approached the precipices of Capri quite in the humour to enjoy all their grandeur. We had shot out a little into the Mediterranean to the north-west of Capri, and there paused a while to gaze at that mimic Alp thrusting up its rugged bulk out of

the waves. All travellers have seen it; but it appears to me that very few, if any, have infused into their descriptions anything like the grandeur of the rock itself. Perhaps, with all their experience, they have found it impossible. To guard against similar failure, I shall not attempt a description, but merely state two or three facts which may assist the fancy in representing the scene to itself. When the moon shines over Naples, over its white buildings, its vast bay, its woods, its promontories, the eye wanders along delighted from Vesuvius outwards until it is arrested by the dark frowning mass of Capri. Scarcely can it be said to be delighted then. The imagination experiences a rough, abrupt, strong, almost painful shock, as it beholds this abode of Tiberius rearing its Titanian proportions into the sky. Cliffs of giddy altitude hang beetling over the waves, with sea-mews skimming about their bases, and eagles rising with difficulty to their summits. Behind them stretch boundless expanses of ether, of the tint of amethyst tinged with smoke. Stars of liquid brilliance hang over the summit of the rock like a coronet, while the moon here and there paints with white light the smooth parts of the rock, which appear to hang like polished tablets against a vast dusky wall.

When we had gazed for some time at this prospect, the boatmen began of themselves to row towards the Blue Cave. Has any one ever rounded the north-western point of Capri without encountering a breeze more or less active? I have never known anybody who has. Let the Mediterranean be ever so calm, the Parthenopean Bay ever so lustrous and lovely, you no sooner approach the rocks of Capri, than the winds begin to blow, the surges to moan, and the caves to reverberate their murmur. At every pull of the oar, our hearts beat as we beheld the rocks throw up their stupendous masses above our heads. We approached the cave; we saw the tiny billows roll in and break with silvery foam against the black slippery rocks which defend it on the sea-side. Presently the oars were drawn into the boat, which, by the impulse already communicated to it, glided in between the rocks, where we found ourselves plunged for a moment in more than Egyptian darkness. By degrees, however, the eye recovered its power, and then we could perceive the moonlight stealing in through chinks and crannies, as if forcing its way through some diaphanous substance, which altered its nature and gave it a magical power over the mind. Still advancing, we reached a narrow ledge, upon which we landed. The boat then put back, while I stood with the doctor gazing out upon the moonlit sea. Rays of light fell here and there upon the dark waters which formed the floor of the cavern. Presently, as I gazed, blue streams shot from both sides of the rock, mingling and traversing each other, glancing, quivering, flashing, and partly illuminating the lofty irregular arch extending over our heads. Far in the distance, on the right, stretched a green avenue, which terminated in a red point; while on the left, a corridor of sapphire led the eye towards an opalescent point. My surprise and pleasure were great and unfeigned, and I expressed my astonishment that so little should have been said by strangers of so wonderful a place. Instead of replying directly to my observation, my companion said:

'On the very spot on which you and I are now standing, a terrible catastrophe took place many years ago. A young nobleman of dissipated habits and fierce character entertained a passion for one of the king's daughters. Being himself of high rank, he thought it scarcely an act of condescension on the part of the monarch to give him the girl in marriage; and accordingly, without the least ceremony, went to the palace and demanded her hand. Had his character been more respectable, the king might perhaps have

consented to overlook the disparity of position. But Girolamo had rendered himself remarkable by the wildness of his life, and was even suspected of piracy. At anyrate, he made voyages to the African coast, and came back from time to time laden with wealth. Some said he plundered the Moors; others, that he made no distinction between Moslems and Christians, but filled his coffers indiscriminately at the expense of all whom he encountered at sea. Influenced by these rumours, the king refused him his daughter; upon which Girolamo spoke thus:

'Your majesty's decision is perhaps the best. I have led a wild and wayward life; and though my fortune is great, and daily on the increase, I ought not, perhaps, to desire a connection with your family. Still, as I and my forefathers have always been faithful subjects to the crown of Naples, you will not, I feel convinced, refuse to grant me a smaller favour.'

'The king, glad to perceive that the Count Girolamo had not taken his refusal to heart, was willing to conciliate him by any concession he considered reasonable.

'Well,' replied Girolamo, 'in a week from this time I intend giving a party in the Blue Cave, and shall have it boarded over and lighted up brilliantly, so that we may dance over the waves and banquet amid the rocks.'

'The idea appeared at once new and striking to the king, and he promised to attend the party with his whole family. It is unnecessary for me to dwell upon the preparations made by Count Girolamo: they were on a scale of great magnificence; and on the appointed night, the royal barge, accompanied by numerous boats, filled with ladies and gentlemen, arrived at the entrance to the cavern. There, to their surprise, they found a series of steps, covered with costly carpets, leading up to what might be called the great saloon, then filled with a blaze of lights, adorned here and there with hangings, and in recesses of the rock, abounding with refreshments, wine sparkled in crystal goblets, and delicacies of various kinds tempted the appetite. After a while, the hall was cleared for a dance, and, as a special favour, Count Girolamo was permitted to lead out the queen. He was all gaiety, all smiles, and the whole company of dancers appeared intoxicated with delight. At length, as the evening drew on, the count enjoyed the pleasure of leading out the princess upon whom his heart had been fixed. It is not known whether the lady herself felt any attachment for Girolamo, though it is believed she did. Whatever may have been the case, as they were gliding along the floor, the count took her in his arms, and stamping violently, a trap-door opened beneath his feet, and down he went with his companion into the dark waves below. The terror and confusion that followed may be easily imagined—the whole party rushed towards the opening in the floor, and lights being brought, they sought to discover the bodies, but without effect. The waves had sucked them out; and it was not until the next morning that they were discovered, locked in each other's arms, beyond the entrance of the cavern.'

As the doctor spoke, the light on both sides of the cave became more powerful, and shewed the surface of the water in the most distinct and vivid manner. The rocks seemed to have been transformed into pillars, with niches and hangings of gorgeous tapestry. Presently a hissing sound ran along the sides of the cave, and we were left in total darkness. The boat then approached, and groping our way into it, we pushed out silently into the moonlight.

'What we have just seen,' observed the doctor, 'is a mere contrivance of my own. I often visit this cave, and have invented an apparatus for lighting it up; but be persuaded that it is often converted into a blaze of splendour by other than human hands, and that Count Girolamo and the princess are beheld sitting

side by side at its extremity. Before them, the waves grow still, and appear to be converted into a marble floor, upon which hundreds of spirits whirl round in the mazes of the dance, while music breathes in through every crevice of the rock, and inspires them with unceasing activity.'

I thanked the doctor for the interesting account he had given me, and returned to Naples, fully persuaded that he would soon need to be taken care of by his friends.

POLYGASTRIC ANIMALCULES.

THE wits of London, better able to discuss the merits of a fable by Dryden or a comedy by Congreve, long continued to amuse themselves with the wonderful discoveries of a body of philosophers that, under the title of the Royal Society, held frequent meetings at Gresham College. The enthusiasm for research that prompted men endowed with ordinary judgment to dissect mal-formed calves—to study critically the motions of spiders, snails, toads—or to feel interested in learning whether there were in certain foreign countries blue bees that made black wax and white honey, and similar subjects of investigation, appeared to the man of fashion in those days a deplorable delusion—pardonable perhaps in the gloomy time of Old Noll, when playhouses were closed, and all sorts of amusement forbidden, but certainly unbecoming such as had the good-fortune to live in the reign of the Merry Monarch. Nor needs such an estimate of the infancy of the distinguished Society surprise us when we bear in mind the apparent uselessness of many of its experiments and researches, and the indifference of its most exalted patrons to the true advancement of science. The chief delight of its royal founder was to put such puzzling queries as neither common sense nor philosophy could satisfactorily solve, or to gratify his curiosity by witnessing an 'anatomical administration,' as the rather rare spectacle of a dissection was called in those days. Surely some apology was afforded to the idle for scepticism regarding the utility of Prince Rupert's glass manufactory, or such a contribution in natural history from the Duke of Buckingham as 'the horne of a unicorn.' Moreover, its *Transactions*, which, under the ponderous title of 'An accompte of the present undertakings, studies, and labours of the ingenious in many considerable parts of the world,' the Society began regularly to publish, contained not a little that must have appeared extremely ludicrous to such—at the time the majority of the public—as could not sympathise with the many errors through which experimental philosophy had to struggle in its progress towards maturity. Among the papers that appeared in the *Transactions* during the year 1675, was one that caused almost as much amusement to the Society as to the loungers of the Mall. It was from a Dutch contributor, Anthony Leuwenhoek of Delft, whose ingenuity in improving microscopes—instruments to which the Society very wisely gave much attention—had procured him honourable distinction among his English associates. The curious observations which the superiority of his glasses enabled him to make, had not hitherto overstepped the limits of belief, but when, in the year mentioned, he declared himself as having discovered certain animals of such extreme minuteness that many thousands of them did not equal a grain of sand, his statement was received with derision. It is not impossible, from the proneness universally shewn by mankind to treat as profane such observations as reveal an elevated physical organisation in other beings, that the daring microscopist might in an earlier age have met the reward of Galileo.

The splendour of Leuwenhoek's discovery might well compensate him for an indifferent reception. He had the high fortune to have been the first to observe that

beyond the power of the keenest vision there lay an unsuspected world of life, surpassing in number all the united occupants of air, earth, and water. Examined through his lenses, the smallest speck of the green mantle of the standing pool resolved itself into myriads of individual existences. It has been reserved to his successors to discover that the waters of the seas, lakes, and rivers, are equally prolific—a view of the boundlessness of animated nature which it is almost impossible to comprehend.

From the facility afforded by vegetable infusions for procuring these little animals, they came to be known as Infusoria. This generic name is still retained; but, by the more scientific arrangement of the great Prussian naturalist, Ehrenberg, the class is divided into Polygastria, or many-stomached, and Rotifera, or wheel-shaped animalcules. It is to the former class that we ask the reader's attention, as the rotifers, from their more advanced organisation, are objects of inferior interest. The polygastrians are so low in the scale of being as to have no fixed type of form. Many important organs they want altogether, and such as they possess are very defective. They have neither brain nor spinal cord; nor eyes, blood, nor proper organs of locomotion. Many species have neither mouth nor digestive canal; and yet with all these defects, they are lively and playful, great eaters, and very fond of their ease. They have managed, in the successive eras of geological change over the globe, to avoid destruction. They are thus at once the tiniest and oldest inhabitants of the earth; nay, notwithstanding their subordinate position, they claim, through that wonderful chain of analogy that connects all nature, kindred with the representatives of the most exalted. Their vitality is so strong, that they are easily revived after several years' apparent death. Absence of air is the most favourable condition for their preservation; in fact, paradoxical as it sounds, interment is the surest way of keeping them alive.

From their abundance and antiquity, we are not surprised to find that these animals have an important function to discharge in the economy of nature. The preservation of life in other beings depends directly upon them. The ceaseless appetite of the polygastrian is employed in reducing the vast mass of effete vegetable and animal matter in the globe that is always hastening to decomposition, and which, if allowed an unopposed development, would speedily make its noxious properties known. This view of their utility enables us to appreciate the fitness of the homely name given to them by Professor Owen—the scavengers of the atmosphere. Nay, further, the effete substances so intercepted become, from assimilation in the system of the polygastrians, adapted to the support of more highly organised animals. It may not be out of place to observe here that the objections made against such water as is seen through the microscope to abound in animalcules, has been frequently urged in forgetfulness of the dependence of pure water upon the presence of a certain number of such beings.

Let us now consider a little in detail the organisation of a polygastrian. The animal essentially consists of a cell. A cell we know to represent the lowest order of vegetable or animal life. The polygastrian cell is only a stage removed from the Gregarina, which stands upon the very border of the two divisions, and is only known not to be a vegetable from its power of independent existence, and never advancing to a further stage of development. Some polygastrian species are bare; that is, the cell has no investment, but the majority are provided with a shell-covering either silicious or calcareous. This shell, fashioned after a variety of quaint patterns, is ingeniously adapted to the peculiar form of its wearer. Across some, it is placed horizontally; in others, it shoots out as a conical prominence over the tiny occupant; while in a third variety, this

defensive armour expands in the shape of a shield. Immense accumulations of these shells are found in different parts of the world. Strata of great depth occur in Bohemia and the United States, entirely made up of infusorial shells. Sometimes their abundance occasions their being applied to unexpected purposes. Thus the berg-mehl, or mountain-meal, a white powder gathered by the people bordering upon Lake Lett-naggejon, near Urnea, in Sweden, and much esteemed as an article of diet when mixed with flour, consists entirely of these. In animals that live in water, having neither fins, tail, nor any fixed form of limb, it becomes a curious subject to inquire into their means of locomotion. In such polygastrians as are attached to foreign bodies, no mechanism of the kind is required; but, in the greater number, progression is generally maintained by cilia or hair-like processes. Some, indeed, have such a mobility of substance as enables them to furnish an extempore limb upon an emergency, but this agreeable power of improvising a hand or foot is not frequently met with. Thanks, however, to its ciliary apparatus, the polygastrian can row nimbly through the water, seize firmly upon his prey, or, if none be at hand, make a slight agitation of the water that will soon accumulate sufficient materials for a meal. The manner of connection of these cilia with the body of the animal is not clearly understood. According to Ehrenberg, they are fixed by distinct muscular processes; but to grant that, were to claim for the order a higher degree of development in the animal kingdom than other observers are disposed to admit. The cilia are sometimes arranged in sets, but more frequently they are scattered irregularly over the animal. They occur in greatest number at the neighbourhood of the mouth, for the obvious purpose of facilitating the seizure of food. The cilia are also of use in the peculiar respiration of the animal, by causing successive currents of water to strike against it.

Although destitute both of brain and spinal cord, the polygastrian is not without an analogue of these organs. A little red dot, once considered an eye, is now known to compose its limited nervous system. The functions of this part of the organisation are obscure, and to this may be ascribed the difference of opinion among naturalists respecting the movements of the animal. These are said by some to be automatic, and not the result of volition—a view apparently based upon the fact of the animal never having been observed in a state of quiescence. But even if there were not many ways of accounting for such restlessness, the evidence in favour of a contrary belief appears pretty conclusive. The most diminutive monad shrinks into a less form from the effect of fear, and carefully avoids, in his merry dance through the water, all contact with his playmates.

Though the polygastrians have no blood or proper circulating apparatus, there is a fluid, intermediate between blood and chyme, which circulates in a little central organ or heart, several pair of which lie along the backs of the larger varieties. But the most extraordinary parts of the organisation of these animals are those by which their digestion and reproduction are maintained. Although the view once held that the polygastrian consisted, as the name indicates, of an aggregation of stomachs, has not been confirmed by further observations, it is not without a certain amount of correctness, so far as the existence of a series of movable sacs or stomachs is concerned. Of these, which are dependent upon that mobility of texture noticed in connection with the means of locomotion, there may be from three or four to as many hundreds. Occasionally, when the animal wishes to gorge upon a victim as large as himself, these stomachs are all displaced—an opening is made at the most convenient position, and the prey enclosed, the little

glutton removing every trace of his temporary mouth. In a few of the more advanced species—and we should always remember that the difference between the larger and smaller polygastrics is as great as between an elephant and a mouse—there is a regular form of mouth, and even a complicated dental apparatus.

The most common mode of reproduction is by *spontaneous fissure*. A longitudinal or transverse division shews itself in some part of the animal, rapidly advances, and, when complete, two individuals result, both equal in size. Not unfrequently, the young, if we may so call it, begins immediately to divide. In the next most frequent process, that of *gemination*, we are reminded of the vegetable kinship of the polygastrian. Here separate animals are thrown off in the form of buds, which differ from those produced by the former method in not attaining maturity for some time after leaving the parent cell. Omitting any notice of a third, or the oviparous process of reproduction, since its existence is disputed, we may mention the curious phenomenon observed in the *volvox globator*. In this little animal, the young may be seen through the transparent texture of the mother. Like her, they are provided with cilia, that enable them to swim almost as actively as after birth. In no long time, these, in their turn, become the recipients of independent existences. Well may Professor Owen say that 'Malthusian principles, or what are vulgarly so called, have no place in the economy of this department of organised nature.'

We shall, in conclusion, state shortly the connection existing between the polygastric and more superior beings, as observed in the great law of unity of organisation. The infusorial monad is the sole unchanging organic form in the animal world. Every member of the four great sub-kingdoms—Radiata, Mollusca, Articulata, Vertebrata—has been a monad at some period of its existence. The little nervous dot of the polygastrian, its rude circulating apparatus and fluid, its displaceable stomachs, are but permanent representations of the temporary forms of the complicated nervous system, the highly organised blood, and the powerful digestion found in the most advanced class of animals. Even the similarity that exists between the human embryo and the polygastrian is retained in certain respects throughout life, for the cilia that line the nasal passages, the larynx, and bronchiæ of the adult man, are identical with those of the invisible monad.

CONVENTIONAL REPUTATIONS.

Literary life is full of curious phenomena. I don't know that there is anything more noticeable than what we may call *conventional reputations*. There is a tacit understanding in every community of men of letters that they will not disturb the popular fallacy respecting this or that electro-gilded celebrity. There are various reasons for this forbearance: one is old; one is rich; one is good-natured; one is such a favourite with the pit that it would not be safe to hiss him from the manager's box. The venerable augurs of the literary or scientific temple may smile faintly when one of the tribe is mentioned; but the farce is in general kept up as well as the Chinese comic scene of entreating and imploring a man to stay with you, with the implied compact between you that he shall by no means think of doing it. A poor wretch he must be who would wantonly sit down on one of these bandbox reputations. A Prince Rupert's drop, which is a tear of unannealed glass, lasts indefinitely, if you keep it from meddling hands; but break its tail off, and it explodes, and resolves itself into powder. These celebrities I speak of are the Prince Rupert's drops of the learned and polite world. See how the papers treat them! What an array of pleasant kaleidoscopic phrases, that can be arranged in ever so many charming patterns, is at their service! How kind the 'Critical Notices'—where small

authorship comes to pick up chips of praise, fragrant, sugary, and sappy—always are to them! Well, life would be nothing without paper-credit and other fictions; so let them pass current. Don't steal their chips; don't puncture their swimming-bladders; don't come down on their pasteboard boxes; don't break the ends of their brittle and unstable reputations, you fellows who all feel sure that your names will be household words a thousand years from now.—*Atlantic Monthly*.

TOAD-WORSHIP.

The practice, which seems so unaccountable, if it be once seriously thought upon, of worshipping some of the lower animals, was not unknown on the coast of Cumana, and their treatment of toads may be mentioned as a ludicrous instance of that kind of superstition. They held the toad to be, as they said, 'the lord of the waters,' and therefore they were very compassionate with it, and dreaded by any accident to kill a toad; though, as has been found the case with other idolaters, they were ready, in times of difficulty, to compel a favourable hearing from their pretended deities, for they were known to keep these toads with care under an earthen vessel, and to whip them with little switches when there was a scarcity of provisions and a want of rain. Another superstition worthy of note was, that when they hunted down any game, before killing it, they were wont to open its mouth and introduce some drops of maize-wine, in order that its soul, which they judged to be the same as that of men, might give notice to the rest of its species of the good entertainment which it had met with, and thus lead them to think that if they came too, they would participate in this kindly treatment.—*Helps's Spanish Conquest in America*.

THE GOOD SHIP MARSHAL.

'Twas the red sundown of Christmas Day,
And off Cape Otway Head,
That the *Marshal* stood for Melbourne port
With canvas sparsely spread.

For all day long it blew a gale,
And they looked for land a-lee;
Yet under short and steady sail
The ship went bowlingly.

And all day long through scud and wave,
And long swell flecked with foam,
Right on and on the *Marshal* held,
Like a courser heading home.

With sundown passed the driving wind—
It passed off gustily:
And slowly down to its deep, deep rest
Sunk the sultry austral sea.

Then the thoughts of all were full in port;
All hopes stood high and dry;
As specks in the good ship's gleaming wake
Shewed the seventy days gone by.

How strange the sound of 'Land, ho! land!'
(How full the round words fall)
They seemed to have wedded hand to hand,
As all wished joy to all.

In the speech of home, heart spoke to heart;
And friendly eye met eye:
Week on week they had walked apart
Whom this parting hour drew nigh.

Nigher yet, and a flaunting group
Broke from the master's door;
Sweeping the ship from stern to poop
For a sight of the golden shore.

And late on the bulwark's side a-lee
Tarried a little band
Of those who could not sleep at sea
In a ship so near to land.

Looking, you saw a white low line—
A long low line of foam,
While they talked of the cheerful frost and snow,
And the Christmas fires at home.

Slowly the headstrong ship wore in
With the steadfast undertow;
While the mistress moon smiled up above,
And the master laughed below.

Over the *Marshal's* shining deck,
And her low shrouds traced so fair,
There fell such calm, that spoken words
Seemed to linger in the air.

Steadily yet her topsails drew,
Stood 'Pilot!' from the truck,
And the helm to a steady hand was true,
When the good ship *Marshal*—struck.

The *Marshal* struck on her larboard bow,
And a hollow sound came, then
She heavily reeled till she shewed her keel,
And heavily grounded again.

Then did the startled master's shout,
And the mate, with word and blow,
Hurry the men to work aloft,
And the women to weep below:

Nearer the plunging vessel's keel,
Nearer the depths beneath;
To try the hold of their hearts on hope?
And to keep the watch of death?

The short night passed in the settling ship;
It passed—what more to say?
Terrors full as a dreadful dream
Pass as a dream away.

Crossing an early angry sun,
Rose something faintly dark;
And answering back to the *Marshal's* gun
Came the gun of an outbound bark.

Close in her cabin's scanty space,
Swarming her slipp'ry deck,
Through a stormy air and a seething sea,
All sailed from the lonely wreck.

Then the young hand with the old was crossed,
And the brown head helped the gray;
For their all but life was lost, was lost
Sad salt-sea miles away.*

Good ships, your ribs are stanch and tried;
Your spars are tough and tall:
But a heart of oak in the master's side
Were the bulwark best of all.

* One needs to know but little of the ways and means of the poorer emigrants to be aware that few venture to bear anything of value on their persons. Taught by the reported experience of others that their class of passengers is almost certain to be robbed, gold, silver, even bills, as well as other valuables in their little stock, are stowed away in the strong box, safe in the hold while the voyage is safe; and when the ship goes down, all goes with it.

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 210.

SATURDAY, JANUARY 9, 1858.

Price 1½d.

QUOTATION.

THE faculty of quotation is one of the most terrible weapons of social life; 'an engine of colloquial oppression' only less tremendous, perhaps, than the asking of riddles and the narration of anecdotes, and sometimes partaking of the worst qualities of both; for often a quotator, who must needs have his lion's share in the conversation at all hazards, whether he be certain or not of getting safe out at the other end of his selected passage, will stop in the middle of it (especially if it be poetry), and appeal to the general company to assist him in that strait to which his own imprudence has reduced him. This has all the ill effect of a conundrum in creating a dead silence, and is even destitute of that meagre hope which exists in the latter case of arriving at something amusing at last. Old gentlemen may be permitted to quote the classics to boys—'*Arma virumque*, what? You young dog! In my time, sir, I should have been flogged if I had not supplied the word by this time!'—because boys have no real relish for conversation: but learned persons and others should be very chary of indulging in this practice in real life, and among ordinary society. It is a pitiable spectacle to see an entire company, half of whom, perhaps, are ladies, put in abeyance, as it were, while a gentleman who has forgotten his Greek is depending upon people who never knew any to fill up the *vacuum* in some sonorous sentence which, after all, may be, is by no means illustrative of the matter in hand. Instead of being sorry for what he has done, too, this sort of character is commonly enraged with the audience, protesting not only that he shall forget his own name next, but that *they* are foolish and ignorant to an extreme degree. 'Every school-boy knows it,' cries he, without remembering that if that really be the case, there was no need for him to be so superfluous as to repeat it. We do not mean to state that a very first-rate conversationalist may not make himself appear to understand and appreciate a Greek quotation, but such a one must be near the top of his profession; nor can even he pay tribute to one only half delivered. Moreover, we are speaking of general society; amongst which are females who cannot divest themselves of an uneasy but not unnatural feeling, that what needs concealment in a dead language, must certainly be something they ought not to hear.

Difficulties in finishing occur by no means unusually in English. A revered friend of our own is perpetually entangling himself in verbose selections from the works of Lord Byron; and as that poet is by no means so universally read now as his admirer imagines, release is often hopeless. 'Good Heavens,

gentlemen,' he exclaimed, on one occasion, after failing in the fifteenth line of an extract which none of us had ever so much as set eyes upon before, 'and you have absolutely never read his *Age of Bronze*!' Is not this at least as abominable as the conduct of the asker of rebuses, whom Sydney Smith recommends should be delivered over to immediate execution, without being suffered to explain the connection between his seventh and his eighth?

Nor, again, is that noxious person, 'a man of anecdote,' to be looked upon with less disgust when he attacks society under the thin disguise of a quotator: for where is the difference whether conversation be interrupted by his avowal that 'that reminds him of an anecdote,' and he at once blockades us by means of such regular approaches; or if he silence the company from some masked but not less fatal battery, such as: 'Ah, you know, that's what Sheridan said to Brummell when they were going down Pall Mall. "I'll bet you," says he; . . . and so on for perhaps a quarter of an hour.' This description of person, in case of his *dramatis personæ* being celebrated and popular, will often introduce them with an air of easy patronage—as, 'that queer old Barham,' or 'that dear Leigh Hunt'—very hard to listen to; and when he begins in this fashion, he is particularly difficult to stop. If he do chance to set before us a good thing tolerably new, he spoils the effect of it by following it up with a course of ancient jokes, the entire contents of his jest-box—putting them back, alas, very carefully afterwards, for another time, but perhaps for the same people.

Apropos of, it may be, pepper, he will remark: 'Poor Tom Hood, during his last illness, was much attenuated; and upon the doctors applying mustard-plasters to his feet, observed: "Ah, sirs, there is very little meat for your mustard."' Now, not above one-third of a company may have heard this before; and the kind of quotator of whom we speak is so elated by that unusual circumstance, that he goes on to tell of the bottle of ink being taken instead of the medicine, and the piece of blotting-paper the patient volunteered to swallow in order to neutralise it, and things even older yet. Still, quotation of some kind we must have. The apt use of it, with judgment and in moderation, is pleasant both to the talker and the hearer. If the latter recognise the 'selection,' his self-love is gratified almost equally with that of the former; but he must be careful not to display his rival knowledge by encumbering the first speaker with aid, and running along, as it were, by the side of the other's hobbyhorse with an unnecessary leading rein: one man is, in ordinary cases, sufficient for one quotation. In general conversation, a single line of poetry, or a couplet at

most, is as much as should be ventured upon. In public speaking, upon the contrary, eight or ten lines may be hazarded, and it is a chance if anything else in the speech be so well received; the reason of which difference is obvious, inasmuch as in the one case many persons lay a claim to the time of the audience besides him who is holding forth; and in the other, a number of folks who have no taste at all for poetry, are flattered by being presumed to have an exquisite appreciation of it.

Most of us, without being such 'comparative sweet young' persons as Prince Hal was, have more or less of his 'damnable trick of iteration;' and the humblest of us is ready to repeat somebody else's words, if it be only to strengthen a position, or to avoid the responsibility of having any opinion of our own.

An ignorant young friend of ours going in for examination, almost without a chance, for one of the open civil service appointments, remarked to us: 'I hope for the best, but expect the worst, as the old woman said when she was buying the pound of tea.' Who was the old woman in question, or what the particular tea, is immaterial; the quotation was as apt as though it came from Machiavelli or Montaigne; and in the same manner, upon the very vaguest authority, we often get the most perfect illustrations. 'You force me to proceed to extremities, as the nobleman said when he cracked the periwinkle in the door,' is an admirable instance of this; and similarly, 'the Man,' 'the Irishman' (who is habitually employed in this capacity), 'the Scotchman,' 'the Frenchman' (also a great favourite), and 'the Poet,' are made use of when memory fails as sponsors for fatherless sayings. All we sometimes get, after the delivery of an apothegm, by way of acknowledgment to its proprietor, is an 'as they say,' or 'as the saying goes,' which is unsatisfactory, indeed; but in such a case the plagiarism is not generally of great value. The Prince Regent and Mr Theodore Hook are so continually invoked upon these occasions, that a true conversationalist would no more dream of referring to them than to Mr Joseph Miller himself: the very mention of their names before a quotation has become a signal for inattention and contempt, and is almost as much an assistance to it as the autograph of a bankrupt to the back of a bill. Mr Charles Lamb has fallen very low, indeed, in the quotation market, and Sydney Smith and Rochefoucauld are drugs. The most artful thing exhibited by some quotators is the reverse of this—namely, the ingenious concealment of an authority who is perfectly well known. For instance, in making use of that philosophical paradox, 'the child is father to the man,' they would think it unwise, and, indeed, extravagant, to add, 'as Wordsworth says,' displaying all that learning in an instant, like the flash of a cracker: they prefer to herald it with, 'as the bard of the lake-country has well expressed it;' or, 'as the greatest metaphysical poet of the century has remarked;' or, 'as the restorer of natural poetry truly sings;' or even with a combination of these three expressions, if they be of rank and wealth enough to venture so far. A good deal of verbosity is permitted to lords and capitalists in this respect.

In writing, we need not point out to those who contribute to reviews, &c., how much more space can be profitably taken up by, 'as the graceful author of the *Pleasures of Memory* has told us,' than by,

'as Rogers says;' besides the advantage of setting the general reader thinking of who the deuce *did* write the *Pleasures of Memory*, and perhaps of even delighting him with the discovery.

We come now to the two highest branches of our subject—the one, that of introducing a quotation as something of our own; the other, that of introducing something of our own as a quotation. The first requires the very greatest delicacy of conduct. There are a number of sagacious people, it must be remembered, in society, too lazy to say anything themselves, who have their ears wide open, nevertheless, to all that is said by others. These are jealous and malicious men—not women, who, indeed, are industrious enough in this respect—who will let you display all your stolen gems to the last jewel, and then turn police-constable in the brutal overhauling of your whole pack. Your *bon mots*, they will swear, were Jerrold's; the epigrams, Tom Moore's; and the repartees those in the *Punch* newspaper of 1852—which it is very likely they were. Now, as the true genius—as we remember to have read in every essay upon the writings of our greatest dramatist—makes everything he touches his own, whether it previously belonged to anybody else or not, so the first-rate conversationalist may reproduce with effect the efforts of bygone wits, in such a way that the parents themselves should not be able to recognise their offspring. In ordinary cases, however, extreme precaution is by no means necessary, and the most wholesale plagiarisms may be made by the self-possessed and dexterous, who have only to confess, upon detection, that 'of course the thing was Jerrold's; they should have supposed everybody knew that; there was no more necessity for inverted commas, than for saying "Macbeth" after quoting the dagger-scene.'

Finally, the reverse of this has to be considered. It is sometimes expedient to borrow a great name to 'edit,' as it were, the production of one's own native talent; and there are some people so conventional that they will listen to nothing unless it be spoken by the lips of authority, having less regard to the merit of a remark than to the fame of him who is supposed to utter it; and there are others so miserably envious as to deride or treat with contemptuous indifference all the efforts of a contemporary to amuse or instruct them. A judicious interposition of a supposititious *deus ex machina* is, in these cases, not only expedient but excusable. We may be (*we are*) very brilliant, and yet need sponsors now and then to answer for us before an unbelieving world. Our bills may be good enough (*they are*), and yet require a good name at their backs to insure acceptance. 'Dickens was telling this story the other night,' 'as Thackeray said to a friend of mine,' 'as Macaulay replied to his publisher,' are very good letters of introduction indeed. These experiments are interesting, not only as illustrative of the weakness of human nature in our fellow-creatures, but also of its strength in ourselves. We have to behold without a groan or outward sign of agony, one of our very best *jeux d'esprit* perhaps swept up into the great treasure-house of an acknowledged genius, who has no need of an addition to his wealth, and made absolutely dangerous for us to claim as our own for evermore. We hear peals of laughter or murmurs of applause paid to persons who have neither desire for nor right to them, while we sit poor and unappreciated—mere spoons for ladling out that honey which we have in reality ourselves collected and hived from the very first. How we long to cast off our disguise, and proclaim ourselves to be indeed the exceedingly clever fellows we are! But should we do so, we are well aware that joke of ours would be the very last that would be listened to. Moreover, in this secret knowledge of our actual merit,

in this patient surrender of our laurels to other brows, is there not something generous, Spartan-like, besides a very exquisite flattery of our self-love?

CATTLE EPIDEMICS.

DURING the past spring and summer, the chief subject of interest to the 'agricultural mind,' both at home and abroad, has been the fact or the apprehension of some infectious disease, popularly called 'murrain,' among the horned cattle. On many parts of the continent, the prevalence of a very destructive epizootic was no matter of doubt. Throughout Denmark and Prussia, in the districts skirting the south shore of the Baltic, and in the Rhenish states of Germany, the cattle-breeders have suffered very severely from the ravages of a disease among their herds, whose cause and cure alike seem to have baffled research, but which was generally supposed to be disseminated by infection. The British farmers have been more frightened than hurt by this calamity; but as the countries where the murrain was most prevalent were precisely those from which the English market was chiefly supplied, an Order in Council was issued some months since, by way of precaution, prohibiting the import of live-stock, carcasses, or raw hides, from the Gulf of Finland, the Russian, Prussian, Mecklenburg, and Lubeck ports on the Baltic, and sundry other quarters whence infection might be apprehended. This regulation provoked much criticism. Medical authorities are indeed altogether at variance on the whole question of epidemics, either as regards man or beast. It is even contended that there is no such thing as infection—that cholera, yellow fever, or even the plague itself, have nothing contagious in their character, but spread merely through the medium of atmospheric miasmata, impure water, unwholesome conditions of heat, damp, dirt, and other 'predisposing causes,' wholly distinct from the influences by which, according to the ancient doctrine, epidemic diseases were diffused among a whole population.

When doctors differ so essentially, we shall not presume to settle the controversy. Certain it is, that the so much dreaded murrain has not visibly extended to England; though whether the disease was kept at arm's length by the Order in Council, or was safely defied by the better feeding, the more careful breeding, and the greater skill in management practised by English farmers, is still problematical. In many cases of epizootic mortality occurring during several years past—ever since agriculture became a science—the most experienced practitioners have been altogether at fault. The loss of many thousand sheep by the 'rot,' or of cattle by some mysterious 'complaint,' can sometimes be traced to the influences of weather or food, but just as often proves wholly inexplicable. Science, on these occasions, is totally bewildered; while the most careful tending of the husbandman proves vain.

One result, however, dominates over all morbiological theories—namely, that in modern eras the access of murrain among cattle has become as rare in occurrence and mitigated in severity, as that of 'plague, pestilence, and famine' among the human race. It is impossible to dissociate this undeniable fact from the improvement in food and nurture which the advance of agricultural science has enabled us to command. Three centuries ago, for example, the very idea of keeping cattle in a state fit for the butcher through the winter months, had never dawned on the human mind. Where was the food to come from, while the pastures were covered with snow, or iron-bound with frost? At that era, the fatted kine were all killed in November at latest; and the whole world, from the lord in his castle to the servitor at his lodge-gates, lived upon salted meat until the ensuing May. Of the gluttonous feasts occasioned and justified by the

superabundance of fresh meat, and especially of those portions of the animal not fit for preservation, at these autumnal slaughtering, a gross but most graphic description may be found in Rabelais. Another and more clearly recognition of the annual event is given in the old festival of Candlemas, when the accumulated stock of tallow, from the summer pasturage of the herds, was formally blest by the priest before its conversion into candles for the long nights of winter. The world in those days was a long way removed even from the possibility of a 'fat-cattle show' at Christmas, in the Baker Street Bazaar, or elsewhere.

The cattle-murrains, in olden times, were attributed to moral and supernatural causes. Homer describes the vengeful Apollo visiting the Greeks before Troy with a pestilence, which began with the dogs, and passed on through the horses and horned beasts to the human race. It shewed some knowledge of the real source of malady, that the calamity was assigned to the divinity who governed the sun, the atmosphere, and other climatic conditions. Among the Jews, an epidemic in cattle was attributed to some national sin—the presence of an Achan in the camp, or the rebellious idolatry of a king. In later times, many singular accounts of epizootical disease are handed down to us by historians; and if their narrative must sometimes be considered more legendary than authentic, they present at all events a vivid picture of the vicissitudes to which society was exposed in times when the production of food, whether for the human race or for their flocks and herds, was so little understood, and remained so much more completely at the mercy of the season than at present. For the examples we are about to give, let us at once confess our obligations to the copious details so industriously collected by the census commissioners of Ireland, touching pestilences and famines, plagues, inclement seasons, atmospheric phenomena, epizootic disease, and other visitations, published in the fifth volume of their elaborate *Report to parliament*.

Not to linger too long in the legendary periods of British, or rather Celtic history, we shall give but a single specimen of cattle-murrain as recorded to have occurred in these isles before the Christian era. This epidemic visited England and Ireland, so far as the vague annals of the event can be interpreted, at a period about contemporary with the last Punic War—that is, 150 years B.C. The contemporary king of Ireland—for the histories of the period are all Irish—was named Breasal, and surnamed Bod-hio-Bhlaith, or 'Cow-destroyer,' in commemoration of the event. In his time, so the record runs in the *Annals of Clonmacnoise*, 'there was such a morren of cows in the land as there were no more then left alive but one bull and one heifer in the whole kingdom, which bull and heifer lived in a place called Gleann-Samasse.' It is mentioned, by way of testimony to the truth of this legend, that the locality named is to this day known to the dwellers in the neighbourhood as Glensamish, or the Glen of the Heifer, and is situated in county Tyrone. The description of some devastating catastrophe as leaving only a single survivor, belongs to the hyperbolic language employed by all oriental races and their descendants. The image recurs more than once in the book of Job. In the Celtic annals, from whence the above record is taken, it is subsequently stated as the consequence of an inclement season, that 'only one' shock of corn was left in the fields, or 'only one' fruit on the tree. Thus, in the time of Cairbre, the 'Cat-headed,' it is chronicled that the 'earth did not yield its produce, inasmuch that there used to be but one grain upon the stalk, one acorn upon the oak, and one nut upon the hazel.' As a contrast to the calamitous visitation in the reign of Breasal, it is related that about fifty years afterwards, in the time of his successor, King Conaim, 'the cattle were without

keepers in Ireland, on account of the greatness of the peace and concord.' The weather seems also to have sympathised in this general harmony, since we find it added that 'the wind did not take a hair off the cattle from the middle of autumn to the middle of spring.' During the reign of this plenty-giving monarch, 'nothing bent but the trees, from the greatness of their fruit in his time.'

During several centuries of what may be termed the twilight period of the historic era, it is curious to notice the rarity of any account of epidemic mortality among the cattle, as compared with the records of famine or pestilence among mankind. The apparent exemption of other and lower animals from these visitations does not arise from any idea, on the part of the chronicler, that the subject was beneath his notice; on the contrary, we find particular mention made, when occasion occurs, of mortality among the cattle. The pestiferous air to which is assigned the plague of 547 A.D., is said to have 'ragged not only against men, but against beasts and reptiles.' Not very long afterwards, it is recorded that a 'poisoned pool made its appearance through a chasm of the earth,' from which a vapour proceeded that proved fatal to men and beasts of burden. During the terrible famine which scourged Britain in 446, Gildas relates that no animals remained on which men could feed, 'save such as could be procured in the chase.' This destruction of the flocks and herds, however, does not seem attributable to disease, but to the fact that they were all eaten up by the famished population. Altogether, it is evident that in the times of which we have hitherto treated—and, indeed, for long after—sheep and kine escaped many of the evils that decimated the human dwellers in this and other lands. As animals, they were considered more valuable, and therefore were better cared for, and enjoyed, besides, exemption from the political convulsions which so repeatedly swept over whole kingdoms, destroying thousands of the human race in their passage, and leaving famine and pestilence behind them to complete the work of devastation.

The numerous records of epizootic disease which have occurred in later eras in different parts of Europe, are seldom unaccompanied by incidents, mentioned, as it were, accidentally, that give some insight into the real cause by which the epidemic was produced. For example, in the collection of Irish chronicles, entitled the *Annals of The Four Masters*, it is stated that in 684 A.D., 'there was a mortality upon all animals throughout the world, so that there escaped not one out of the thousand of any kind of animals.' Afterwards, however, it is recorded of the same year, that a great frost occurred, 'even so that the lakes and rivers were frozen, and the sea between Scotland and Ireland was frozen, so that there was a communication between them on the ice.' These intense frosts seem to have been very frequent at that era. Mention is often made of reciprocal visits paid by the Irish and Scots to one another across the ice. Elsewhere we find it related that the inland waters were frozen up; that the river Boyne was passable on the ice; that 'horses and hunters went on Lough Neagh to chase the wild deer; that in the winter of 939-40, 'the foreigners'—that is, the Danes—'plundered Inis-Mochta on the ice.' This was an island containing a church which formerly existed at a place still called Inishmet, in Meath. Seldom also do we find the record of these severe frosts, or of heavy floods, long-continued wet or drought, or other tokens of inclement seasons, without meeting an account very shortly afterwards of some murrain among cattle. These accounts shew various forms of disease, extending sometimes to the lower animals. Thus, one year we are told of 'a great destruction among the birds.' In 916, after a 'great snow and unusual frost, destruction was brought

upon cattle, birds, and salmon.' Of that year it is related that 'many evil signs' were manifested: 'The heavens seemed to glow with comets: a flame of fire arose from beyond the west of Ireland until it passed over the sea eastwards. A few years later, a terrible mortality occurred, which included 'men, cattle, and bees.' Long subsequently, the Italian writer Ramazzani describes a murrain which extended even to bees and silkworms. On that occasion, also, the distemper among animals was contemporaneous with blight in the vegetable creation. Early in June, this author relates that 'all the springing corn was spotted with mildew; grapes and other fruits were spoiled or destroyed; and the leaves of herbs and shrubs eaten to the stem by various insects.' Wholly unable to appreciate the true influence of natural phenomena, the chroniclers of that age are just as apt to exaggerate some consequences as to ignore others. Lightning is made to play a frequent part in the destruction of living beings, and even of whole towns. In 1184, the *Annals* record how the castle of Lough Keg, the stronghold of the Mac Dermotts, was destroyed by fire from heaven, wherein six or seven score of distinguished persons perished, together with fifteen of kingly or chieftain descent. In 966, a ball of fire is said to have passed through Leinster and killed 1000, or, as another account gives it, 100,000 persons, and flocks, besides burning the houses of Dublin. Narrations of tempests frequently occur, in which the wind blew down hundreds of dwellings; though this, perhaps, does not imply that the blasts were stronger, but that the buildings were weaker than at present. Making every allowance for the ignorance or the credulity of the reporters, it seems impossible to avoid the conclusion, that in these periods, frosts, rains, and tempests, and other meteorological phenomena, evinced an intensity of which we have had no recent experience.

One phenomenon frequently recorded, and always as a sign of special wonder, is that of a shower of blood. The portent was naturally considered very terrible. Once, indeed, the prodigy seems to have occasioned no alarm. Red snow having fallen in the reign of King Elim, the people fancied that it had both the taste and colour of wine. The phenomenon was accordingly regarded in a jovial aspect, and the king was styled Elim Oilfinshneacta, or Elim of the Great Wine-snow. At other times, the occurrence is related in terms that prove the utmost dismay. Lough Neagh was turned into blood several times within a period of a century or two, the event being recorded in the same style of alarm as that used when the moon also turns into blood; and occasionally the phenomena seem to have been supposed related to one another. On one occasion, Loch Lephim—now Leam—in Westmeath, 'was turned into blood, so that it appeared to all as if it were lumps of blood all round the edge.' This appearance has lately been thoroughly investigated and explained. Red snow was found by Captain Parry and Sir John Franklin, and the colour traced to the presence of microscopic plants of the cryptogamic order. As this occurred in high latitude, and no red snow is mentioned as having fallen in Ireland in modern periods, we find another cause to infer that the climate of the British Isles has become mitigated. Respecting the blood-coloured water, some curious facts were told in a paper read a few months since before the Royal Society by Mr Macdonald, a gentleman who was attached to Her Majesty's surveying-ship *Herald*. The colouring matter is a minute plant popularly called the Sea Sawdust, and accounts were given of its appearance in various parts of the ocean besides the Red Sea, to which it has actually given its name.

Quitting these earlier chronicles, we pass to the records of the two great cattle-murrains which took

place in the last century. Of them, the first began in 1711. In that year, as Short relates, a pestilential plague broke out among the cattle in Hungary, Italy, Germany, and Central Europe generally, of so infectious a character, that it spread from their saliva 'wherever they licked the grass, laid down their mouths, or came near other animals.' In Holland this epizootic lasted for three years, and killed 300,000 cows, oxen, and bulls. Passing into England, the disease reached its acme during the years 1718-14-15, contemporaneously with the accession of the House of Hanover. Great multitudes of cattle were lost in the metropolitan districts, and large sums were paid to various farmers and graziers by the state as compensation-money, in consideration of their submitting to various precautions intended to prevent the epidemic extending to other parts of the kingdom. Nevertheless, in 1715, it appears that the pestilence had spread over various counties previously unaffected. The second epizootic of the eighteenth century began in the celebrated year when the young Pretender invaded Scotland, 1745. Bascombe relates that the plague 'began in Turkey, thence passed over Europe, and ultimately spread to England.' Here, however, as elsewhere, we find many local circumstances to account for the calamity. The spring and summer of that year were most inclement—storms and floods are stated to have taken place all over the British Islands. In the Dublin district, 'there was not a brook or rivulet which was not swelled to an extraordinary height.' In natural sequence, we hear that corn, potatoes, and oats were very dear; then that 'there was a famine among the black-cattle;' and afterwards, of the frightful mortality of kine, sheep, and horses. But the infection doctrine still prevailed. In Faulkners' *Journal* it is told how, in 1747, from fear of contagion, the removal of horned cattle from one town to another was prohibited. Berkeley, the famous Bishop of Cloyne, wished to make this cattle-distemper a means of introducing his favourite remedy, tar-water. He writes: 'If I can but introduce the general use of tar-water for this murrain, which is in truth a fever, I flatter myself this may pave the way for its general use in all fevers whatever.' Continuing in 1751, of which 'the spring was stormy and cold, the summer wet,' the murrain proved unusually destructive. Webster reports of this year that there were 'great inundations in England and France,' and that a mortal distemper prevailed among horses and cattle in England; 30,000 cows are said to have died of it in Cheshire alone. During the following year, when the summer was 'exceedingly wet,' a great rot occurred among the sheep, and we are informed by a journal of the period, that 'the distemper rages about the skirts (of London), insomuch that last Saturday several cows were buried in the fields at the bottom of Gray's Inn Lane.' The scourge ceased about a hundred years ago. In 1756, it is recorded that 'the mortality among the horned cattle, which hath raged more or less for these ten years past, seems to have departed.' This announcement appears in the *Dublin Medico-Philosophical Memoirs*; and the writer proceeds to explain the cause, according to the vague theories current at that day, by attributing the disappearance of the epizootic to certain heavy rains and overflowings of the meadows, 'which they think has washed off any remaining infection in the grass and herbage.'

The last record of epizootic for which we can afford space, relates to an epidemic among a different species of animal to any before mentioned. Towards the close of the last century, the cats were visited with a strange pestilence. The feline race, in Ireland, are reported to have died in numbers during the year 1797, 'of a mere murrain similar to that which sometimes seizes and spreads among the black-cattle.'

Some of their skins being dried, and the hair taken off by lime, 'appeared full of small holes, caused by worms or insects. When seized with the distemper, the poor animals appear to be in the greatest agony.' Contemporaneously with this cat-murrain, mention is made of a comet in the heavens, and a 'dreadful gale in the Channel.' Evidently the year was an ill-starred one for the witches. The cat-disease of this year was epidemic in England, France, and even America. Webster relates that 'in England a pestilence among cats swept away those animals in thousands. The same cat-plague was soon after epidemic in France; it appeared in Philadelphia in June, and was very fatal throughout the States. Fish died in some of the rivers, and hydrophobia was again epidemic.'

Modern improvements in agricultural science, if they have not rendered murrain among cattle impossible, have at anyrate limited the range and largely diminished the frequency of these visitations. There is no doubt still plenty to do in the way of sanitary reforms, both for man himself and the inferior animals whom he has subdued to his use. Still, a great deal has been already done in that direction—more, perhaps, in proportion for the brutes than for their human keepers and owners. By skilful crossing of breeds, we obtain a far hardier and healthier stock; and wholesome fodder is now procurable even in the most inclement seasons. The epizootics which heretofore ravaged the flocks and herds for years together, have almost disappeared at anyrate from the more civilised countries of Europe. As constituting so valuable a possession to a large class of the community, and of nutritious food to all, this comparative exemption of cattle from the murrains which once so often nearly destroyed them, must prove no small addition to the 'sum of human happiness.'

THE LAKE ON THE MOORS.

We were a cosy little party of six—three on horseback, and three in a pony-carriage. We started courageously, in the teeth of sundry prophecies of rain, and of the moors being full of swamps from the rain that had already fallen. Cornish people have a natural talent for prophesying bad weather, so we declined to place too much stress on these forebodings; and though the sun only shone between great masses of cloud, and the blue sky only shewed itself in rifts, we declared that a cloudy day was better than one all sunshine; that even if it rained, we wouldn't mind; and, in short, we spoke so bravely, and looked so determined, that the foe succumbed, with a parting fire of, 'Well, don't blame me if you get drenched,' which we received with fortitude.

So, about two o'clock on this doubtful September afternoon, we set off to see the lake on the moors. Much had we heard of it, one of the most curious phenomena of this western land, which is so rich in marvels. We had heard that not only was it a large pool of water on the very highest ground upon the moors, completely isolated, and with no visible spring or source of supply, but—popular taste being always inclining to paint the lily, and add impossibility to the wonderful—that its waters were salt; that it ebbed and flowed with the tides of the sea; and that on its shores sea-weeds and shells, and other marine waifs and strays, were to be found. Happily, however, our ideas had been set to rights by the perusal of a very interesting record of the parish in which the lake is situated, and when we went on our way to see it, we were perfectly 'up' in what we were to expect. We knew that the lake was 'about a mile in circumference, surrounded with barren heaths and desolate moors;' that the road to it lay across the wildest and dreariest scene in Cornwall. Also we knew that there were

two traditions attached to the spot, both connected with a certain Tregeagle, who is to be heard of in many parts of Cornwall, and generally in connection with the most disreputable character known in modern or ancient history, and whose occupations are numerous enough, though always partaking of the same character. These appear chiefly to be of some such light nature as making trusses of sand, binding them with ropes of the same, conveying them from one place to another; or, as in the case of this moorland pool, dipping an unfathomable depth of waters dry, by means of a limpet-shell with a hole in it. As to the cause of his being appointed to such onerous commissions, we have said there are two legends of him connected with this one place. The first, which we indignantly scouted as being a great deal too legal for romance, and more like a law report than a tradition, affirms that he was a steward who defrauded his master by not entering a certain sum of money in his books. After his death, therefore, ensued a lawsuit; but when the cause was brought on at the assizes, the supposed debtor raised the spirit of Tregeagle, and brought him as a witness 'into court.' (Is any one credulous enough to believe in such a ghost as this? The idea is preposterous.) 'Being questioned concerning the affair in debate,' proceeds this remarkable legend, 'Tregeagle admitted the payment, and the plaintiff was nonsuited. On returning from the bar, this singular witness was left behind in the court; for the defendant on being requested by some of the gentlemen of the long robe to take him away, replied sternly, that as he had been at the pains of bringing the witness, those who complained might take the trouble to remove him.'

Hence, since they could not banish this perturbed spirit, there arose the necessity of finding some employment for it; and to empty the moor-pool, on the terms previously set forth, was the first task appointed. During this work, whenever the wind was easterly, 'the wicked one was thought to pursue him three times round the pool, from which place he was always obliged to escape to Roach Rock, where, on putting his head into one of the chapel windows, he was safe.'

So much for tradition number one. The second is the real and genuine one, which elicits our sympathies, commands our attention, and takes our credulity by storm. It is set forth in a ballad of some seventy verses (be not alarmed, good reader; we purpose not to quote it entire), which, whether or not it is veritably as ancient as its language would indicate, possesses much of those quaint and picturesque elements which generally distinguish old ballad poetry, and in which consists its most special and peculiar charm. So we will take it with us, and dip into it as we ride along these pleasant Cornish lanes, with their high banks, and whereon the various ferns flourish with tropical luxuriance, and where the honeysuckles are perpetual temptations to linger and gather, and so become possessed of their glories more than by the eye.

To commence at the commencement, we learn that 'in Cornwall's famed land, by the poole on the moore, Tregeagle the wicked did dwell'; also, that he was a shepherd, that he grew ambitious, wished for wealth; and finally, one moonlit night, on the wide, lonely heath, made a compact with the Individual before alluded to in this chronicle, who appeared before him like a gigantic knight in armour, riding on a black steed, and with black lance, bugle, &c., and two hideous dogs, complete. The bargain concluded, Tregeagle became a grand knight, with a splendid castle, which stood exactly where the moor lake now appears—retainers, horses, huntsmen, minstrels, and every requisite for a nobleman's family, in those days. Not content with these possessions, however, he seems to have indulged a disposition the reverse of amiable; for we are told that

He marked each daye with some horrible deede;
Some mansyn must burne, or some traveller bleede,
Or hatefulle that daye to his sighte.

But now comes the 'central interest' of the story, which is thus ominously heralded:

It chaunced one evenynge as homewarde he wendes,
Deepe muttered the Hagg of the Storme;
Earth trembles as boundynge the skyes she ascendes—
The welkyn across her blacke winges she extendes,
And nature with darkness deformes.

And nowe the bold hunters theye stode alle aghaste,
Their stoute heartes with feare overawed:
The rede lyghthinges glared, the rayne poured faste,
And loude bowled the demons that rode on the blaste,
And Terroure the tempeste bestrode!

Whene swift from the woode, and all wylde with
affryghte,
A damsele advancinge they spyed;
All whyte were her garments, her palfrey was whyte,
Wyth sylver and golde, and wyth jeweles bedyghte,
And a litle payge rode bye her syde.

Tregeagle proffers the shelter and hospitality of his castle to the storm-surprised wayfarers, who prove to be Goonhylda the fayre, the daughter of Earl Cornwaile, who, with her trusty page, had lost the rest of the hunting-party with whom she had set forth in the morning. Of course, the wicked knight loves Goonhylda straightway, and while she is innocently full of gratitude to him for the kind hospitality he extends to her, he villainously causes her father to suppose that his child has been torn to pieces by the 'ravenous beastes of the nyghte.' This done, he proffers himself and his possessions to the 'fayre mayden than floweres the fayrest more fayre,' who, however, modestly informs him that she is already betrothed to a knight, and that since 'fayre is the daye and refulgente the morne,' she fain would hasten to depart home, and relieve her father's heart of fears for the safety of his Goonhylda. Upon which the treacherous knight shews himself in his true colours, 'smyles insydious, and bendes hys darke browe,' and boldly announces that she cannot be permitted to depart, and that he has prevented the possibility of rescue by causing the powerful Earl Cornwaile to suppose her dead. Affairs thus seem desperate enough for the unfortunate lady; but all is not over, for the little payge,

Though few were his yeares,
Yet cunningy and shrewde was the boye;
Where he satte in a corner, thys speech overheares,
And faythefulle as swift to the stable repayres,
And seizes his courser wyth joye.

How this gallant little Roberto steals from the castle, spurs on his fleet horse to Duneoyd's high gate, and tells the earl—the real state of the case; how the old earl buckles on his armour, and summons his horsemen so valyante and bold; and how the troop set forward, and reach Tregeagle's gate before the 'greye morne peeped the easterne hills o'er:' all this can be readily imagined, as detailed by the next half-dozen verses. But while they wait reply to the blast on the horn with which they summon Tregeagle, the horrified company hear instead that 'shrylle blast from the farre dystante heathe, whych the eares of alle mortales confoundes.' It is the Black Hunter come to claim Tregeagle, the time stated in the terms of the bargain between them having expired.

Then forth came Tregeagle all palyed wyth feare,
And fayne woulde more fawoure have founde,
But loude roared the thundere, and swyfte through the
ayre
The rede bolte of vengeance shot forth the wyth a glare,
And strooke him a corpe to the ground!

Then from the blacke corpse a payle spectre appeared,
And hyed him away through the nyghte,
Whenequicklye the yelpes of the hell-houndes are hearde,
And to the pursuite by the bugle are cheered,
Whyle behynde thunders after the spryte.

And nowe ruddie mornynge agayne gilds the skyes,
The hellish enchantment is o'er:
The forrest and castle no more meete their eyes,
But where from greene woodes its bryghte turrets did
ryse,
Nowe spreads the darke poole on the moore.
And neare its dreare margyn a mayden was scene
Unhurt! Goonhylda the fayre:
For stytle guardian angels dyd keepe her, I ween
And neare her gay palfrye in trappyns so sheene,
Whych late torne by wolves dyd appeare.

So the villain is discomfited, and virtue is triumphant, after the orthodox manner; and a dread interest is thrown about 'the poole' by the final verse of the ballad, which affirms that—

Stylle as the trav'lere pursues hys lone waye,
In horror, at nyghte o'er the waste,
He heares Syr Tregagle with shrieks rushe awaye,
He heares the Blacke Hunter pursuing his preye,
And shrynkes at his bugle's dreade blaste!

Well—we are not pursuing a lone way now, nor are we likely to be benighted on the moor; but in good sooth, the scene is desolate and eerie on which we now cast our eyes. We are on the St N— moors. Round us, on far as we can see, stretch the great barren wastes, swelling here into hills, crowned with some fantastically shaped group of tors—sinking there into hollows terribly suggestive of swamps and bogs. A few rough cattle are scattered about among the gorse clumps and heather near, and very far away to the left rise some one or two mine-stacks—their tall chimneys diminished to toy-like dimensions by the space between. This is everything suggestive of life that is to be seen in that wide prospect. Savage desolation usurps the rest, and reigns supreme.

And yet wilder and stranger was the scene, when presently the turbulent clouds overhead burst into that peculiar soft, fast rain that we never know to perfection except on mountain or on heath. Like a shroud it wrapped us round, isolating us from all surroundings for a while, as we galloped on through it. Then we found a turf-pile, under the lee of which we sheltered ourselves and our horses, and watched the storm clearing off. Very soon those restless clouds, more passionate than inexorable, began to part and sweep off in grand masses to the north-east; while through the rifts and breaks little rills of intense gleaming light began to trickle down upon the moorland, making oases of emerald brightness upon its darkness and desolation. Once more the wind came in our faces, vigorous, vital, yet withal protecting rather than assailing, as though indeed it 'had a giant's strength,' but disdained 'to use it like a giant.' Once more the veil is drawn aside from distant hill, and tor, and flat, and the vast plain is before us again, in the clear, gray, cloudy light of the autumn afternoon.

And now the pony-chaise is seen wearily toiling along the wretched road, one wheel about a foot above the other, proceeding along the ridge of a wagon-rut. They are all very wet, and the suggestion that 'possibly a house is near, judging from the pile of turf against which we are standing,' is received with eagerness. In short, another turn of the road brings us to the outbuildings of a little farm, and at the yard gate stands a man with a child in his arms. Looking up as we approach, the man reveals a face equally comely and kindly—dark intelligent eyes, well-formed features, and curly brown hair. There is freedom, and therefore a certain picturesque grace in his movements, as he stoops to set the child on its feet, and

as he stands, leaning against the gate answering our questions: 'How far is it to the pool? Which is the best way? Could our horses and chaise be put up for a while in any shed or outbuilding?' And these inquiries being satisfactorily answered, pending the arrival of the pony-chaise, we enter freely into conversation, and our desire for information being frankly gratified, we soon know all about our new friend and his circumstances. Yes, it is his house; but he has not lived there long—only five months. There is a small farm attached to it—a cattle-farm, which he manages to attend to in the interval of mining-work; for he is a miner, and works at Wheal Katharine over there. That is his little boy, his only one (Kiss your hand to the ladies, Johnnie. Do you love the ladies, my son?) He thinks it will be more rain. It has been a stormy day, and is not over yet, he reckons. Yes, it's coming to rain now—there are the first drops. Would the ladies come inside and rest, and dry their things, and perhaps take a cup of tea? His wife will make a cup of tea in a minute. Though we decline this, we gladly accept the proffered shelter; and his brown face lights up, and beams a thousand welcomes upon us, as we alight and enter under his roof-tree. There, in the neat kitchen, we find his wife, a fair, well-grown young woman, busily engaged in mending Johnnie's pinafore. She cordially econds her husband's welcome, stirs together the smouldering turf upon the hearth, piles on more, and soon has a glorious fire burning, before which our wet garments speedily become more comfortable. Then the miner's hospitality again stirs his honest soul. *Won't we have some tea? Couldn't we take a cup of tea and some bread and butter? We are not to say no, he entreats, because we are in a poor man's house. We are as purely welcome as—* Imagination fails him for a parallel; but, indeed, there is no need of a spoken welcome, when we look into his kind, eager face: the generous soul of a king—that is, an ideal king—shines out from those dark eyes of his. Then a new thought strikes him. Perhaps the ladies could eat some bread and cream? Fresh cream scalded an hour since! Could we? Great but quietly expressed delight ensues when one lady 'thinks she really should like a little piece.' With a sort of glad dignity he says: 'Mary, my dear, spread some slices of bread and cream—and some jam—some jam on the top of it!' and he subsides into contentment and quiet talk with the gentleman of our party, while we eat the bread and cream, which is delicious. Meanwhile, the rain ceases, and the time passes. The evenings are short, now, and we have to see the pool yet, and ride back afterwards. So our miner now proffers us the best adjunct to our comfort he can give, and says he will be our guide to the pool. So we leave the neat cottage and the busy wife. Johnnie is asleep in the cradle now, and we may place within his tiny fist that which we could no more offer to our host than to the Duke of Devonshire were he entertaining us at Chatsworth; and we mount our horses again, and follow our guide.

We toiled up a tolerably steep ascent that rose behind the little farm, and was doubtless part of it; a portion of the moorland had here been planted with some sort of corn. Harvest was well over, and a tolerably good crop gathered in, we were glad to hear, as we cautiously wended our way among the stubble. Up, and up, and still up we went, till at length we gained the heath, and our horses' feet sunk down into the soaked turf; for now we were fairly on the moor, with its little patches of yellow gorse and purple heather, that seemed striving hard to keep gay and cheerful in the midst of the very barrenest and forlornest external circumstances that ever oppressed the soul of a vegetable. Darkly, hopelessly frowned the brown waste, with its deceitful bogs and swamps, many and near between, and increasing in frequency

and extent the further we went on. Still there was a slight rise in the ground, and as we ascended, the bleak prospect widened, till suddenly, like a great ghost glaring on us, there was the pool. It certainly was the very eeriest and most uncanny-looking sheet of water that could be imagined. Brightly it flashed in the sunlight, that just then burst forth benignantly; the wind rippled its surface into sea-like waves, and it plashed against the mimic shore of sand and pebble that surrounded it, with the low music that was as an echo caught from the greater harmonies of the grand waters afar off. And yet, for all this brightness of aspect and soothingness of sound, it was a ghostly, unreal, phantom-like, deceitful-looking lake—such as one might dream of in a feverish sleep, and shiver to remember when awake. A very devil's pool, of which the beauty itself was chilling, and inspired neither love nor trust. It might have vanished like a wraith, melted like a mist from before our eyes, and it would scarcely have seemed unnatural. A little boat was offered to us to row across, were we so minded; but I think we should instinctively have recoiled from launching forth on those treacherous-looking waters, even had our time been longer, and the clouds not gathering so blackly in the distance.

And we turned our faces from the pool, and retraced our way, still guided by our miner, whose cheery face, ever and anon turned back towards us, it was a wholesome pleasure to see.

Now fell the rain again—and once more washed from our vision the vast scope of rugged barrenness. But this was a storm that rapidly passed us by, leaving us in clear atmosphere, with the wind blowing lustily about us, while afar off the clouds seemed wildly and tumultuously leaping from very sky to earth. It was a wondrous scene; as slowly coming down the hill again we watched that fury of rain in the distance spend itself, and subside; while, coming into life with the death of its violent passion, was born a rainbow; at first pale, then gradually increasing into perfection of arch, and radiance, and colour, till the bleak moorland was transfigured, and the world once more looked as though it knew God.

It was good so to depart on our way back, with that last vision in our eyes; it was good to remember, when we were at home again, not only the weird lake, but the soft sky that shone above it—not only the legendary Tregagle, but the real flesh-and-blood miner, our friend for ever, with his honest face and genial, generous warmth of heart—not only the great moor, looking like incarnate desolation and despair, but the glorious rainbow, the visible type of divine love and human faith.

OCCASIONAL NOTES.

A WORD ON THEATRICALS.

It is matter of common remark, that the theatres in general are now ministering to a lower taste than was formerly the case. The managers say they find the galleries more resorted to than the boxes, and they have to legislate for the amusement of their supporters. It might be asked, why do the more affluent classes not go to the theatre? and there might be some difficulties to settle before a satisfactory answer could be given; but we set all such questions aside, and content ourselves with the acceptance of the facts placed before our eyes, that vast multitudes of nearly all classes—both those who would be found in boxes, and those who would be found in galleries, if they frequented theatres—now prefer the lecture-room to the playhouse. It shows there are evenings to spend away from home, and money to pay for entertainment, now as heretofore, but that the theatre is no longer the

exclusively favourite place for the spending of evenings from home. It seems to us that theatrical managers should lay this fact well to heart. They should see in it that, in getting up frivolous vaudevilles for the sixpenny galleries, they are letting vast numbers of potential auditors of a better class escape them. The questions for them are: Could any of these people be brought back to the theatre, or induced to give it a share of their patronage? and, Would the theatre, in recovering them, necessarily lose any other class? It strikes us that the management of the Princess's Theatre by Mr and Mrs Charles Kean is a fact greatly favourable to the affirmative in one case, and to the negative in the other. By legislating for a cultivated taste, by introducing a thoroughly respectable element into their system, they have carried all classes, and been highly successful. We regard this as the first theatre to discern the tendencies and actual attainments of the age—to see that men and women now require that even with their amusements there must go some mental improvement, some gratification to a refined taste, something of a worthy nature to form an excuse to themselves for the time they are spending in amusement. Its reproductions of esteemed plays with correct historic illustrations in dresses and scenery, at once pleasing in general effect and highly instructive, have been, in our apprehension, amongst the most meritorious doings in the whole history of the English theatre. We speak as provincialists who only see London occasionally and superficially—neither bound over by private spite to be snarlers, nor allured by private regard to be panegyrists. We report our own simple impressions from what we have witnessed. Well, may not other managers profit by taking the same or analogous means to throw a respectable element into their performances? We really can see no reason why they should not.

THE SCOTCH SYSTEM OF BANKING.

The Scotch system of banking, of which one used to hear panegyrically a few years ago, was simply this—a *joint-stock bank, prudently conducted*. There have of late been several banks both in England and Scotland, professedly on the Scotch system; and they were so—*barring the prudence*. That made a great difference—so great, that it is questionable if they could justly be said to be upon the Scotch system.

Scotch banks will probably be for some years more coolly referred to than they used to be. Yet this is only as it were to talk depreciatingly of a family because it has had one or two *mauvais sujets* in it. The steadiness, solidity, and durability of the good old Scotch banks are precisely what they have ever been. The three of Edinburgh, whose notes were put into the Castle at the approach of Prince Charles's army in 1745—namely, the Bank of Scotland, the Royal Bank of Scotland, and the British Linen Company's Bank—are all flourishing in the highest credit to this day. The first of these has had its doors open every day, and answered every demand upon it, since the time which Lord Macaulay describes in his *History of England*. It is not easy to imagine that such a door can ever be shut. And as this bank has always a reserve of two millions in government stocks, it may be said to have given a tolerably good guarantee that the door *will* continue to be kept open. Of like character and credit-worthiness are several of more modern establishment; but as a rule, the solidity is in proportion to the antiquity.

And the reason is plain. The newer banks, in their eagerness to obtain business and connection, have in general been less disposed than the older ones to hold by the old prudential maxims. The old, having fewer temptations to go wrong, have more generally kept right. The safety of the joint-stock banks lay

in the caution they exercised in trusting men of business with funds for their mercantile speculations. The old system was—to look well to the character of a bill before discounting it—that is, to see that it represented a genuine transaction, and that the names on it were trustworthy—to give moderate cash-credits on sound security, and only where there appeared a likelihood of the favour proving serviceable to a sound business. Money was taken in at a moderate interest, to be employed in these ways at a profit; but the bank took care to keep good reserves in case of a pressure arising. The modern system was the reverse of all this, and the consequences are what we have lately seen.

The personage in Marryat's novel of *Peter Simple* who believed that everything now happening had happened before, would have had a support to his notion in the history of Scotch banking. The Western Bank was prefigured eighty-five years ago by the bank of Douglas, Heron, & Company, of which the head-office was placed at Ayr. It had been set up in 1769 with £96,000, subscribed by about a hundred and forty individuals, mostly unacquainted with banking business. It made notes without limit, and to get them into circulation, was unusually liberal in discounting bills. No poor struggling tradesman or farmer was refused credit to help him on. It was thought to be at once a good business for the bank and a useful thing for the country. Of course, an artificial stimulus was given to trade and to expenditure, and for a time all seemed going on well. But in June 1772, the great banking failure of Mr Fordyce created a general panic. A run on Douglas, Heron, & Company commenced, and in a few days they found it necessary to suspend payments in specie, and to propose instead making their notes carry interest. Then there were meetings of well-meaning but ignorant gentlemen to express confidence in the bank, and offer to continue taking its notes, exactly as there were in the case of the Western. Leading shareholders, including the Duke of Queensberry and the Duke of Buccleuch, went to the Bank of England to ask assistance, precisely as the Western directors went to the Edinburgh banks; but the Bank of England, having already Douglas, Heron, & Company's notes to the extent of £150,000, was indisposed to trust them any further. There was next—exactly as we have seen in the recent case—a howl of indignation from the embarrassed bank and its friends against the Bank of England, without a word of acknowledgment of the great sins of the embarrassed bank itself, or of the justice of the punishment it was now suffering. Persons locally interested realised Sydney Smith's idea of human benevolence in an extreme form: We must run upon you for our deposits, because we cannot want the money, but endless disgrace to those rich banks in Edinburgh which have refused to help you! And this lasted till, in the course of a few months, it was discovered that there was a hopeless gulf to be filled up; and Douglas, Heron, & Company closed business a little after the end of their third year, leaving an amount of destruction in their wake such as Scotland had not experienced since the wreck of the Darien Expedition. It is said that a large proportion of the land of the county of Ayr changed hands in consequence. For the remainder of their lives, its shareholders were never done with paying; and we have been told that their families, in some instances, did not get their accounts satisfactorily closed till some time after the passing of the Reform Bill, at the distance of upwards of sixty years from the calamity!

The recent failure, then, of the Western is a second splendid example of the error of an over-facility in granting accommodation. It ought now to be seen, through the medium of experience, if the principle be still obscure, that it does not do to deal out large

sums to traders without capital and men struggling with debt. That is Scotch banking, *minus* the prudence; a thing altogether to be condemned.

When the old private banks of England failed in such large numbers in 1825-6, it was thought desirable to introduce new establishments in imitation of the joint-stock banks of Scotland, which were understood to be thriving and solid concerns. Banks were accordingly set up on what was called the Scotch plan—namely, joint-stock; and, in many instances, managers were obtained for them from Scotland. But it was soon found that the directors took accommodation for themselves out of the coffers of the bank, a thing never heard of in Scotch banks; and the management was in general unable to exercise that careful discrimination in a large bustling mercantile community like Manchester or Liverpool, which it could do in a little community such as that of Edinburgh, where the character and circumstances of everybody are more or less known. Owing to these causes, there have been many disastrous failures of banks on the so-called Scotch plan in England. But were these banks truly like the Scotch banks?

We would wish our southern readers to understand that the Scotch banks which used to be referred to as such models of banks, are all still much as they used to be. Or if they have given in, as we believe they have, to the vice of over-facility—forced thereto by the competition of younger establishments conducted on vicious principles—it is not to any serious extent, and will probably be hereafter to one still less so, for the history of the two suspended banks is a serious lesson. The venerable establishments we have enumerated, and several of the more modern, are all of them prudently conducted and of fair prosperity. They are the depositories of some forty millions, the floating uninvested capital of Scotland; and their three millions of notes, backed by the legal proportion of gold, are the circulating medium of the country (sovereigns being barely known in Scotland). We believe we can prognosticate with tolerable safety that this system of things will long go on unchanged, and to the perfect satisfaction of Scotland itself, if the state-doctors will permit.

'AFAR IN THE DESERT.'

WHEN the gentle and genial Thomas Pringle sang his Desert ode, which lingered in the ear of Coleridge like a spell, the desert in question was comparatively little known. 'The silent Bush-boy alone by his side' had only begun to tell, or to *click*, his tale in the ear of Europe; and the 'valleys remote' of the ourebi, the gnu, the gazelle, the hartebeest, and the gemsbok, were still covered by the blue veil of distance, behind which they played their fantastic tricks, more like shadows than realities. Since then, many an adventurous knight has threaded the maze of these primeval forests, and sounded the horn at the gates of their enchanted castles of living rock, and started with a thrill of gallant fear as the challenge was answered by the roar of the lion, and the trumpet of the elephant, the ogre and giant of the region. Many a story of brave emprise and of religious heroism has come to us from these wild regions. The shadiest nook of the African south is as well known as a field of silvan war as the scene of an English steeple-chase or a Scotch deer-hunt, but still our curiosity is unsatisfied; and here comes the narrative of another last Nimrod, as new, and fresh, and exciting as ever.*

Nor is this surprising, when we know that as yet we are only on the borders of the mighty population of

* *Sporting Scenes amongst the Kaffirs of South Africa.* By Captain Alfred W. Drayson, Royal Artillery. London: Routledge. 1858.

feræ nature; that in the far interior, the whole face of the country may sometimes be seen, as the Boers report, 'covered for miles with a densely-packed body of blesbok, boutebok, springbok, and wildebeest. In the trek-boken, or migration of the spring-bok, the inconceivable numbers destroy all the grass, leaving the plain like a vast cattle-fold; hundreds die from being in the rear, and not getting anything to eat, while those in the front are fat, but from this very cause become at last lazy, and gradually fall in the rear, to become thin in their turn, and move again to the front.' Captain Drayson, even in the civilised part of the country, encountered a herd of two hundred elands coming on at full speed, led by their bulls, and at the sound of the hunter's fire, although large and apparently unwieldy animals, making prodigious leaps in the air.

Scenes like this occur in the 'open;' but the bush has other denizens, and awakens other sensations. Our adventurer's first excursion into the forest introduced him into the presence of a herd of forty elephants.

'A strange mysterious feeling came over me in being thus brought for the first time on the fresh traces of evidently a numerous herd of these gigantic animals. I began to ask if it were not great impertinence for two such pigmies as we now seemed, to attempt an attack upon at least forty of these giants, who, by a swing of their trunks, or a stamp of their foot on us, could have terminated our earthly career with as much ease as we could that of an impertinent fly? There is also an utter feeling of loneliness and self-dependence in treading the mazes of these vast forests. One mile of bush always appeared to remove me further from man and his haunts than twenty miles of open country. One is inspired with a kind of awe by the gloom and silence that pervade these regions, the only sounds being the warning-note of some hermit-bird, or the crack of a distant branch. The limited view around also tends to keep every other sense on the alert, and the total absence of every sign of man, or man's work, appears to draw one nearer to the spirit-world, and to impress us with a greater sense of the Divine presence.'

It would be easy to fill our space with very exciting combats between the knight and the giants; but these being the staple of various other books of the kind, we prefer turning to details of a more novel character. Captain Drayson has a very observant eye, and does not content himself with adventures and pictures. His volume, in fact, may be described as the *vade mecum* of South African hunters; it is so full of remarks useful or necessary to the sportsmen of these regions. His pupils, however, cannot well be numerous, if we judge by the qualifications considered as absolutely essential, even to mediocrity in the chase. 'It is absolutely necessary not only to be a good shot, but to be so after a sharp four-mile gallop, and from either shoulder; to load as well while at full speed as when on foot; to be able to ride boldly across country, and allow your horse to go downhill at speed over the large stones and with a loose rein; to pull up, dismount, fire, and get up again with a rapidity a monkey might envy; and when an animal has been wounded and is out of sight, to lean over your horse's shoulder, and follow the spoor at a canter on the hard ground, with the accuracy of a hound; and last and not least, to take care to fly clear of your horse when he turns over in a jackal's or porcupine's hole, instead of letting him come on you, and smash a few ribs. These and many other qualifications, I have no doubt, most of my readers possess; but there may be some who do not, and who in consequence would not stand *Al* in the far south.'

To follow the spoor, or, as the Americans call it, trail, is not the gift of instinct. The tracks of the animals pursued are as obvious to the experienced

European as to the native, although in his novitiate he is no doubt frequently astounded by what may seem to him the supernatural intelligence of his black guide, who not only points the path the unseen object has taken, but describes the sex, size, and pace of the animal. The footprint of a male elephant is round; that of a female, elliptical; and six times the diameter of these impressions gives the height of the animal. An engraving in the volume puts us in possession of numerous secrets of the kind; and after studying it by the fireside, Mr John Smith may comfort himself with the idea, that if fate should ever lead him into the South African bush, he will be able to tell at a glance the spoor of a rhinoceros from that of a hippopotamus, of a buffalo from an eland or a hyena, a leopard, an ostrich, or a wild pig. He will be able to distinguish, likewise, whether the animal has galloped, or trotted, or walked. 'When judging of elephants, it may be concluded that, if they browsed, they must have moved slowly; if they are found to have passed through the forest in Indian file, they travelled at a quick walk; and if they disregarded old paths, and smashed the branches of trees in their course, that they moved very rapidly.'

Our sportsman mentions, that when his attention was drawn to an object about four miles distant, before he had found the correct focus of his glass, the Boers with their naked eye would have decided correctly that it was a hartebeest. 'Elands,' said they in explanation, 'always look light fawn-coloured when they turn, whereas hartebeest look red; buffaloes, black—these three animals being the most commonly met with in these plains. The wild boar—the "vleck vark" of the Dutch—is told by its dark colour, and because it is not so large about the head and shoulders as a buffalo; besides, four or five are generally found together. When the sportsman becomes acquainted with the habits of the animals, the positions which they occupy, as also their way of moving, will generally shew to what class the game belongs.'

An animal whose spoor is not thought worth describing, will perhaps be found as interesting by the reader as any other. Captain Drayson had gone out one morning to see the sun rise in a very beautiful part of the desert. 'Suddenly I heard a hoarse cough, and, on turning, saw indistinctly in the fog a queer little old man standing near, and looking at me. I instinctively cocked my gun, as the idea of Bushmen and poisoned arrows flashed across my mind. The old man instantly dropped on his hands, giving another hoarse cough, that evidently told a tale of consumptive lungs; he snatched up something beside him, which seemed to leap on his shoulders, and then he scampered off up the ravine on all-fours. Before half this performance was completed, I had discovered my mistake; the little old man turned into an ursine baboon, with an infant ditto, which had come down the kloof to drink. The "old man's" cough was answered by a dozen others, at present hidden in the fogs; soon, however,

Uprose the sun, the mists were curled
Back from the solitary world
Which lay around;

and I obtained a view of the range of mountains gilded by the morning sun.

'A large party of the old gentleman's family were sitting up the ravine, and were evidently holding a debate as to the cause of my intrusion. I watched them through my glass, and was much amused at their grotesque and almost human movements. Some of the old ladies had their olive branches in their laps, and appeared to be "doing their hair;" while a patriarchal-looking old fellow paced backwards and forwards with a fussy sort of look: he was evidently on sentry, and seemed to think himself of no small importance. This estimate of his dignity did not appear to be universally

acknowledged, as two or three young baboons sat close behind him watching his proceedings; sometimes, with the most grotesque movements and expressions, they would stand directly in his path, and hobble away only at the last moment. One daring youngster followed close on the heels of the patriarch during the whole length of his beat, and gave a sharp tug at his tail as he was about to turn. The old fellow seemed to treat it with the greatest indifference, scarcely turning round at the insult. Master Impudence was about repeating the performance, when the pater, shewing that he was not such a fool as he looked, suddenly sprang round, and catching the young one before he could escape, gave him two or three such cuffs that I could hear the screams that resulted therefrom. The venerable gentleman then chucked the delinquent over his shoulder, and continued his promenade with the greatest coolness: this old baboon evidently was acquainted with the practical details of Solomon's proverb. A crowd gathered round the naughty child, which, childlike, seeing commiseration, shrieked all the louder. I even fancied I could see the angry glances of the mamma, as she took her dear little pet in her arms, and removed it from a repetition of such brutal treatment.'

We are told likewise of a tame baboon whose great delight was in frightening the Kaffir women. On selecting his victim, he would rush at her as if he intended to devour her, and away she would fly for bare life, dropping her basket or hoe. But he soon caught hold of her, and seizing her by one leg, stared in her face, mowing and grinning, and moving his eyebrows at her like an incarnate fiend. When her screams at length brought assistance, in the shape of a Kaffir cur, Jacko sprang up a tree, and resting secure on an upper branch, 'gazed upwards and around, with a quiet and contemplative air, as though he had sought this elevated position for the sole purpose of meditating on the weakness of baboon and animal nature generally, but more particularly on the foibles of excited Kaffir cur.'

The baboon, when tame, however, is sometimes of more use than to frighten women, who he knows will throw down the hoe instead of breaking his head with it. He is made use of to discover water in the desert when his master would perhaps perish without it. A little salt is rubbed on his tongue to irritate his thirst, and he is then let go; "he runs along a bit, scratches himself, shews his teeth at me, takes a smell up-wind, looks all-round, picks up a bit of grass, smells or eats it, stands up for another sniff, canters on, and so on. Wherever the nearest water is, there he is sure to go." This anecdote was corroborated by others present.'

Besides the author's adventures, there are several very exciting narratives in the volume, more especially one of a Boer who was severely bitten in a conflict with a wounded leopard. After contriving to despatch the animal with his knife, he lay down helpless, expecting death before the morning, and thinking it hardly worth his while to notice a sensation he had as if something were crawling upon his shoulder. When daylight came, he looked at his broken arm lying useless beside him, and saw a great brown-looking thing lying over it—the fat bloated body of a hideous puff-adder. The sound of voices was now heard—his friends had come to look for him; but he dared not answer, he dared not move. As their steps came near, the puff-adder raised his broad head, and looked towards the new-comers, and then, removing from the warm lodging he had tenanted perhaps for hours, glided away through the brushwood.

But the most novel narrative in the book bears no relation to wild animals; it is a genuine Kaffir love-history, wearing to us the air of romance, owing to the manners being new and strange. The heroine is a

certain Peshaua, a young lady whose reputation for beauty does not seem to have been affected, in the gallant captain's estimation, by the circumstance of colour. Indeed, he remarks on another occasion, that one very soon gets over that prejudice—that after having looked for some time on the rich black of a Kaffir belle, a white lady appears bloodless, consumptive, and sickly! Peshaua, when our traveller saw her, was the head-wife of a Kaffir called Inkau, and manifested her dignity and her husband's love, by doing little work, and being fashionably dressed in beads and brass. The beads, which were red, blue, and white, hung in strings round her head, neck, and wrists; her waist was adorned with a little apron of fringe, ornamented with beads, and her ankles were encircled with a fringe made from monkey's hair. This was the full dress of Peshaua, for whom twenty cows had been paid, and five men speared, before she became the bride of Inkau. The wooing is described in the following narrative, taken down from the lips of the fortunate husband:

"I had long heard people talk of Peshaua being a beauty, but did not think much about it until I went buffalo-shooting near her father's kraal. I stopped there one night and saw her. *Ma mee!* she was *muthle kakulu!* [the superlative of beautiful]. I talked to her a great deal, and I thought that she would soon like me. I went out next day, and shot a young buffalo. I managed to get help enough to bring it to the kraal, and I gave it all to Peshaua. Her father had asked many cows for her, but somehow no one had yet offered enough. When I heard this, I felt very frightened lest some one should carry her off before I could manage to buy her. My two wives I had always thought would have been enough for me, and I had given so many cows for them, that I really had not twenty left. I considered, how I could manage, and hoped that fourteen cows paid, and seven more in ten moons, would be as good as twenty now. But Ama Sheman, her father, would not have this, and told me that a young chief named Boy would give the twenty cows at once. I was very angry at this, and asked Ama Sheman to wait a little, which he agreed to do for four months, as he said he would sooner see her my *umfazi* [wife] than Boy's. I went home, and was always after elephants. I got very rash, and was nearly killed by them once or twice, for my gun was not big enough. At last I killed a large bull-elephant, and got eight cows as my share. I started off at once to tell Ama Sheman that my cows were ready. He did not seem pleased to see me, but told me he should like to see my cows. He was an old *chingana* [rogue], and wanted to see which had the finest lot of cattle, Boy or I, as Boy had now offered twenty cows as well as myself. Mine were the finest, so it was agreed that I was to take Peshaua as my *umfazi*. When this was settled, I went out to try and shoot a buffalo for our marriage-feast. I did kill a large one before the sun was up high, and I returned with it to the kraal. As I came near, I heard the women and children screaming. I ran up, and found that Boy had watched all the men out of the kraal, had then walked quietly in with three of his people, and caught my dear Peshaua, and, before she had suspected anything, carried her off. Ama Sheman went out to try and stop them, but he was knocked on the head with a knob-kerry, and lay as if dead. They got off well from the kraal, and were out of sight when I returned, for they did not think I should be back so soon. I shouted for the men, who soon came in. We got our assegais, and I had my gun. Ama Sheman came all alive again, and eight of us started in chase. We went fast, and soon sighted the four rascals. As we came near them, they seemed surprised, and did not know what to do. They soon let Peshaua loose, and ran for their lives. We gained on them, and I threw away my gun, that I

might run quicker. They had a river to cross, which was deep; they were wrong to try and get across; they ought to have fought on this side. Before they had gone over half the water, we had assagied two of them. They soon sank, and were eaten up by the alligators. The other two got over. We all jumped into the water, and swam after them. One of our young men, a very fast runner, went past me, and neared Boy; as he did, he shouted to him not to run like a dog, but to stop and fight. Boy took no notice until the man was close to him, when he suddenly stopped, turned round, and threw an assagy, which went through our fast runner, and killed him. It was Boy's last achievement, for I was on him like a leopard, and my assagy going into his heart was pleasant music to me. The other Kaffir was killed by Ama Sheman. We hid their bodies, as we did not wish a war with their kraal. We all kept the story quiet, and they did not for some time discover what had become of Boy and his party. The hyenas and vultures soon picked their bones."

We must now close this amusing volume, recommending it to two classes of readers: those who have themselves the prospect of hunting elephants and buffaloes in the wilds of South Africa, who will find in it very useful lessons; and those who have no prospect of the kind at all, who will find in it pictures graphic enough to enable them to do very well without the reality.

O Ç E O L A :

A ROMANCE.

CHAPTER VI.—THE ALLIGATOR.

To one brought up—born, I might almost say—upon the banks of a Floridian river, there is nothing remarkable in the sight of an alligator. Nothing very terrible either; for, ugly as is the great saurian—certainly the most repulsive form in the animal kingdom—it is least dreaded by those who know it best. For all that, it is seldom approached without some feeling of fear. The stranger to its haunts and habits, abhors and flees from it; and even the native—be he red, white, or black—whose home borders the swamp and the lagoon, approaches this gigantic lizard with caution.

Some closet naturalists have asserted that the alligator will not attack man, and yet they admit that it will destroy horses and horned cattle. A like allegation is made of the jaguar and vampire bat. Strange assertions, in the teeth of a thousand testimonies to the contrary.

It is true the alligator does not *always* attack man when an opportunity offers—nor does the lion, nor yet the tiger—but even the false Buffon would scarcely be bold enough to declare that the alligator is innocuous. If a list could be furnished of human beings who have fallen victims to the voracity of this creature, since the days of Columbus, it would be found to be something enormous—quite equal to the havoc made in the same period of time by the Indian tiger or the African lion. Humboldt, during his short stay in South America, was well informed of many instances; and for my part, I know of more than one case of actual death, and many of lacerated limbs, received at the jaws of the American alligator.

There are many species, both of the caiman or alligator, and of the true crocodile, in the waters of tropical America. They are more or less fierce, and hence the difference of 'travellers' tales' in relation to them. Even the same species in two different rivers is not always of like disposition. The individuals are affected by outward circumstances, as other animals are. Size, climate, colonisation, all produce their effect; and, what may appear still more singular,

their disposition is influenced by the character of the race of men that chances to dwell near them!

On some of the South-American rivers—whose banks are the home of the ill-armed apathetic Indian—the caimans are exceedingly bold, and dangerous to approach. Just so were their congeners, the alligators of the north, till the stalwart backwoodsman, with his axe in one hand and his rifle in the other, taught them to fear the upright form—a proof that these crawling creatures possess the powers of reason. Even to this hour, in many of the swamps and streams of Florida, full-grown old alligators cannot be approached without peril: this is especially the case during the season of the sexes, and still more where these reptiles are encountered remote from the habitations of man. In Florida are rivers and lagoons where a swimmer would have no more chance of life, than if he had plunged into a sea of sharks.

Notwithstanding all this, use brings one to look lightly even upon real danger—particularly when that danger is almost continuous; and the denizen of the *cypriere* and the *white cedar* swamp is accustomed to regard without much emotion the menace of the ugly alligator. To the native of Florida, its presence is no novelty, and its going or coming excites but little interest—except perhaps in the bosom of the black man who feeds upon its tail; or the alligator-hunter who makes a living out of its leather.

The appearance of one on the edge of the savanna would not have caused me a second thought, had it not been for its peculiar movements, as well as those I had just observed on the part of the mulatto. I could not help fancying that there was *some connection between them*: at all events it appeared certain, that the reptile was following the man!

Whether it had him in view, or whether trailing him by the scent, I could not tell. The latter I fancied to be the case; for the mulatto had entered under cover of the maize-plants, before the other appeared outside the timber; and it could hardly have seen him as it turned towards the gap. It might, but I fancied not. More like, it was trailing him by the scent; but whether the creature was capable of doing so, I did not stay to inquire.

On it crawled over the sward—crossing the corner of the meadow, and directly upon the track which the man had taken. At intervals, it paused, flattened its breast against the earth, and remained for some seconds in this attitude, as if resting itself. Then it would raise its body to nearly a yard in height, and move forward with apparent eagerness—as if in obedience to some attractive power in advance of it! The alligator progresses but slowly upon dry ground—not faster than a duck or goose. The water is its true element, where it makes way almost with the rapidity of a fish.

At length it approached the gap; and, after another pause, it drew its long dark body within the enclosure. I saw it enter among the maize-plants, at the exact point where the mulatto had disappeared! Of course, it was now also hidden from my view.

I no longer doubted that the monster was following the man; and equally certain was I that the latter *knew* that he was followed! How could I doubt either of these facts? To the former, I was an eye-witness; of the latter, I had circumstantial proofs. The singular attitudes and actions of the mulatto; his taking out the bars and leaving the gap free; his occasional glances backward—which I had observed as he was crossing the open ground—these were my proofs that he knew what was coming behind him—undoubtedly he knew.

But my conviction upon these two points in nowise helped to elucidate the mystery—for a mystery it had become. Beyond a doubt, the reptile was drawn after by some attraction, which it appeared unable to resist—its eagerness in advancing was evidence of this, and

proved that the man was exercising some influence over it that lured it forward.

What influence? Was he beguiling it by some charm of Obeah?

A superstitious shudder came over me, as I asked myself the question. I really had such fancies at the moment. Brought up, as I had been, among Africans, dandled in the arms—perhaps nourished from the bosom—of many a sable nurse, it is not to be wondered at that my young mind was tainted with the superstitions of Bonny and Benin. I knew there were alligators in the cypress swamp—in its more remote recesses, some of enormous size—but how Yellow Jake had contrived to lure one out, and cause it to follow him over the dry cultivated ground, was a puzzle I could not explain to myself. I could think of no natural cause; I was therefore forced into the regions of the weird and supernatural.

I stood for a long while watching and wondering. The deer had passed out of my mind. They fed unnoticed: I was too much absorbed in the mysterious movements of the half-breed and his amphibious follower.

CHAPTER VII.

THE TURTLE-CRAWL.

So long as they remained in the maize-field, I saw nothing of either. The direction of my view was slightly oblique to the rows of the plants. The corn was at full growth, and its tall culms and broad lanceolate leaves would have overtopped the head of a man on horseback. A thicket of evergreen trees would not have been more impenetrable to the eye.

By going a little to the right, I should have become aligned with the rows, and could have seen far down the avenues between them; but this would have carried me out of the cover, and the mulatto might then have seen me. For certain reasons, I did not desire he should; and I remained where I had hitherto been standing.

I was satisfied that the man was still making his way up the field, and would in due time discover himself in the open ground.

An indigo flat lay between the hommock and the maize. To approach the house, it would be necessary for him to pass through the indigo; and, as the plants were but a little over two feet in height, I could not fail to observe him as he came through. I waited, therefore, with a feeling of curious anticipation—my thoughts still wearing a tinge of the weird!

He came on slowly—very slowly; but I knew that he was advancing. I could trace his progress by an occasional movement which I observed among the leaves and tassels of the maize. The morning was still—not a breath of air stirred; and consequently the motion must have been caused by some one passing among the plants—of course by the mulatto himself. The oscillation observed farther off, told that the alligator was still following.

Again and again I observed this movement among the maize-blades. It was evident the man was not following the direction of the rows, but crossing diagonally through them! For what purpose? I could not guess. Any one of the intervals would have conducted him in a direct line towards the house—whither I supposed him to be moving. Why, then, should he adopt a more difficult course, by crossing them? It was not till afterwards that I discovered his object in this zigzag movement.

He had now advanced almost to the nether edge of the cornfield. The indigo flat was of no great breadth, and he was already so near, that I could hear the rustling of the cornstalks as they switched against each other.

Another sound I could now hear; it resembled the howling of a dog. I heard it again, and, after

an interval, again. It was not the voice of a full-grown dog, but rather the weak whimper of a puppy.

At first, I fancied that the sounds came from the alligator: for these reptiles make exactly such a noise—but only when young. The one following the mulatto was full grown; the cries could not proceed from it. Moreover, the sounds came from a point nearer me—from the place where the man himself was moving.

I now remembered the white object I had observed as the man was crossing the corner of the savanna. It was not an opossum, then, but a young dog.

Yes. I heard the cry again: it was the whining of a whelp—nothing else.

If I could have doubted the evidence of my ears, my eyes would soon have convinced me; for, just then, I saw the man emerge from out the maize with a dog by his side—a small white cur, and apparently a young one. He was leading the creature upon a string, half-dragging it after him. I had now a full view of the individual, and saw to a certainty that he was our woodman, Yellow Jake.

Before coming out from the cover of the corn, he halted for a moment—as if to reconnoitre the ground before him. He was upon his feet, and in an erect attitude. Whatever motive he had for concealment, he needed not to crouch amid the tall plants of maize; but the indigo did not promise so good a shelter, and he was evidently considering how to advance through it without being perceived. Plainly, he had a motive for concealing himself—his every movement proved this—but with what object I could not divine.

The indigo was of the kind known as the 'false Guatemala.' There were several species cultivated upon the plantation; but this grew tallest; and some of the plants, now in their full purple bloom, stood nearly three feet from the surface of the soil. A man passing through them in an erect attitude, could, of course, have been seen from any part of the field; but it was possible for one to crouch down, and move between the rows unobserved. This possibility seemed to occur to the woodman; for, after a short pause, he dropped to his hands and knees, and commenced crawling forward among the indigo.

There was no fence for him to cross—the cultivated ground was all under one enclosure—and an open ridge alone formed the dividing-line between the two kinds of crop.

Had I been upon the same level with the field, the skulker would have been now hidden from my sight; but my elevated position enabled me to command a view of the intervals between the rows, and I could note every movement he was making.

Every now and then he paused, caught up the cur, and held it for a few seconds in his hands—during which the animal continued to howl as if in pain!

As he drew nearer, and repeated this operation, I saw that he was *pinching its ears*!

Fifty paces in his rear, the great lizard appeared coming out of the corn. It scarcely made pause in the open ground, but still following the track, entered among the indigo.

At this moment, a light broke upon me: I no longer speculated on the power of Obeah. The mystery was dissolved: the alligator was lured forward by the cries of the dog!

I might have thought of the thing before, for I had heard of it before. I had heard from good authority—the alligator-hunter himself, who had often captured them by such decoy—that these reptiles will follow a howling dog for miles through the forest, and that the old males especially are addicted to this habit. Hickman's belief was that they mistake the voice of the dog for that of their own offspring, which these unnatural parents eagerly devour.

But, independently of this monstrous propensity, it is well known that dogs are the favourite prey of

the alligator; and the unfortunate beagle that, in the heat of the chase, ventures across creek or lagoon, is certain to be attacked by these ugly amphibia.

The huge reptile, then, was being lured forward by the voice of the puppy; and this accounted for the grand overland journey he was making.

There was no longer a mystery—at least, about the mode in which the alligator was attracted onward; the only thing that remained for explanation was, what motive had the mulatto in carrying out this singular manoeuvre?

When I saw him take to his hands and knees, I had been under the impression that he did so to approach the house without being observed. But as I continued to watch him, I changed my mind. I noticed that he looked oftener, and with more anxiety, *behind* him, as if he was only desirous of being concealed from the eyes of the alligator. I observed, too, that he changed frequently from space to space, as if he aimed at keeping a screen of the plants between himself and his follower. This would also account for his having crossed the rows of the maize-plants, as already noticed.

After all, it was only some freak that had entered the fellow's brain. He had learned this curious mode of coaxing the alligator from its haunts—perhaps old Hickman had shewn him how—or he may have gathered it from his own observation, while wood-chopping in the swamps. He was taking the reptile to the house from some eccentric motive?—to make exhibition of it among his fellows?—to have a 'lark' with it? or a combat between it and the house-dogs? or for some like purpose?

I could not divine his intention, and would have thought no more of it, had it not been that one or two little circumstances had made an impression upon me. I was struck by the peculiar pains which the fellow was taking to accomplish his purpose with success. He was sparing neither trouble nor time. True, it was not to be a work-day upon the plantation; it was a holiday, and the time was his own; but it was not the habit of Yellow Jake to be abroad at so early an hour, and the trouble he was taking was not in consonance with his character of habitual *inouciance* and idleness. Some strong motive, then, must have been urging him to the act. What motive?

I pondered upon it, but could not make it out.

And yet I felt uneasiness, as I watched him. It was an undefined feeling, and I could assign no reason for it—beyond the fact that the mulatto was a bad fellow, and I knew him to be capable of almost any wickedness. But if his design was a wicked one, what evil could he effect with the alligator? No one would fear the reptile upon dry ground?—it could hurt no one?

Thus I reflected, and still did I feel some indefinite apprehensions.

But for this feeling, I should have given over observing his movements, and turned my attention to the herd of deer—which I now perceived approaching up the savanna, and coming close to my place of concealment.

I resisted the temptation, and continued to watch the mulatto a little longer.

I was not kept much longer in suspense. He had now arrived upon the outer edge of the hommock, which he did not enter. I saw him turn round the thicket, and keep on towards the orangery. There was a wicket at this corner, which he passed through, leaving the gate open behind him. At short intervals, he still caused the dog to utter its involuntary howlings.

It no longer needed to cry loudly, for the alligator was now close in the rear.

I obtained a full view of the monster as it passed under my position. It was not one of the largest, though it was several yards in length. There are some

that measure more than a statute pole. This one was full twelve feet, from its snout to the extremity of its tail. It clutched the ground with its broad webbed feet as it crawled forward. Its corrugated skin of bluish brown colour was coated with slippery mucus, that glittered under the sun as it moved; and large masses of the swamp-slime rested in the concavities between its rhomboid scales. It seemed greatly excited; and whenever it heard the voice of the dog, exhibited fresh symptoms of rage. It would erect itself upon its muscular arms, raise its head aloft—as if to get a view of the prey—lash its plaited tail into the air, and swell its body almost to double its natural dimensions. At the same time, it emitted loud noises from its throat and nostrils, that resembled the rumbling of distant thunder, and its musky smell filled the air with a sickening effluvium. A more monstrous creature it would be impossible to conceive. Even the fabled dragon could not have been more horrible to behold.

Without stopping, it dragged its long body through the gate, still following the direction of the noise. The leaves of the evergreens intervened, and hid the hideous reptile from my sight.

I turned my face in the opposite direction—towards the house—to watch the further movements of the mulatto. From my position, I commanded a view of the tank, and could see nearly all around it. The inner side was especially under my view, as it lay opposite, and could only be approached through the orangery.

Between the grove and the edge of the great basin, was an open space. Here there was an artificial pond only a few yards in width, and with a little water at the bottom, which was supplied by means of a pump, from the main reservoir. This pond, or rather enclosure, was the 'turtle-crawl,' a place in which turtle were fed and kept, to be ready at all times for the table. My father still continued his habits of Virginian hospitality; and in Florida these aldermanic delicacies are easily obtained.

The embankment of this turtle-crawl formed the direct path to the water-basin; and as I turned, I saw Yellow Jake upon it, and just approaching the pond. He still carried the cur in his arms; I saw that he was causing it to utter a continuous howling.

On reaching the steps that led down, he paused a moment, and looked back. I noticed that he looked back in both ways—first towards the house, and then, with a satisfied air, in the direction whence he had come. No doubt he saw the alligator close at hand; for, without further hesitation, he flung the puppy far out into the water; and then, retreating along the embankment of the turtle-crawl, he entered among the orange-trees, and was out of sight.

The whelp thus suddenly plunged into the cool tank, kept up a constant howling, at the same time beating the water violently with its feet, in the endeavour to keep itself afloat.

Its struggles were of short duration. The alligator, now guided by the well-known noise of moving water, as well as the cries of the dog, advanced rapidly to the edge; and without hesitating a moment, sprang forward into the pond. With the rapidity of an arrow, it darted out to the centre; and, seizing the victim between its bony jaws, dived instantaneously under the surface!

I could for some time trace its monstrous form far down in the diaphanous water; but, guided by instinct, it soon entered one of the deep wells, amidst the darkness of which it sank out of sight.

CHAPTER VIII.

THE KING VULTURES.

'So, then, my yellow friend, that is the intention!—a bit of revenge after all. I'll make you pay for it,

you spiteful ruffian! You little thought you were observed. Ha! you shall rue this cunning devilry before night.'

Some such soliloquy escaped my lips, as soon as I comprehended the design of the mulatto's manoeuvre—for I now understood it—at least I thought so. The tank was full of beautiful fish. There were gold fish and silver fish, hyodons, and red trout. They were my sister's especial pets. She was very fond of them. It was her custom to visit them daily, give them food, and watch their gambols. Many an aquatic *cotillon* had she superintended. They knew her person, would follow her around the tank, and take food out of her fingers. She delighted in thus serving them.

The revenge lay in this. The mulatto well knew that the alligator lives upon fish—they are his natural food; and that those in the tank, pent up as they were, would soon become his prey. So strong a tyrant would soon ravage the preserve, killing the helpless creatures by scores—of course to the chagrin and grief of their fond mistress, and the joy of Yellow Jake.

I knew that the fellow disliked my little sister. The spirited part she had played, in having him punished for the affair with Viola, had kindled his resentment against her; but since then, there had been other little incidents to increase it. She had favoured the suit of his rival with the quadroom, and had forbidden the woodman to approach Viola in her presence. These circumstances had certainly rendered the fellow hostile to her; and although there was no outward show of this feeling—there dared not be—I was nevertheless aware of the fact. His killing the fawn had proved it, and the present was a fresh instance of the implacable spirit of the man.

He calculated upon the alligator soon making havoc among the fish. Of course he knew it would in time be discovered and killed; but likely not before many of the finest should be destroyed.

No one would ever dream that the creature had been brought there—for on more than one occasion, alligators had found their way into the tank—having strayed from the river, or the neighbouring lagoons—or rather having been guided thither by an unexplained instinct, which enables these creatures to travel straight in the direction of water.

Such, thought I, were the designs and conjectures of Yellow Jake.

It proved afterwards that I had fathomed but half his plan. I was too young, too innocent of wickedness, even to guess at the intense malice of which the human heart is capable.

My first impulse was to follow the mulatto to the house—make known what he had done—have him punished; and then return with a party to destroy the alligator, before it could do any damage among the fish.

At this crisis, the deer claimed my attention. The herd—an antlered buck with several does—had browsed close up to the hommock. They were within two hundred yards of where I stood. The sight was too tempting. I remembered the promise to my mother; it must be kept; the venison must be obtained at all hazards!

But there was no hazard. The alligator had already eaten his breakfast. With a whole dog in his maw, it was not likely he would disturb the finny denizens of the tank for some hours to come; and as for Yellow Jake, I saw he had proceeded on to the house; he could be found at any moment; his chastisement could stand over till my return.

With these reflections passing through my mind, I abandoned my first design, and turned my attention exclusively to the game.

They were too distant for the range of my rifle; and I waited a while in the hope that they would move nearer.

But I waited in vain. The deer is shy of the

hommock. It regards the evergreen islet as dangerous ground, and habitually keeps aloof from it. Natural enough, since there the creature is oft saluted by the twang of the Indian bow, or the whip-like crack of the hunter's rifle. Thence often reaches it the deadly missile.

Perceiving that the game was getting no nearer, but the contrary, I resolved to course them; and, gliding down from the rock, I descended through the copse-wood to the edge of the plain.

On reaching the open ground, I rushed forward—at the same time unleashing the dogs, and crying the 'view hilloo.'

It was a splendid chase—led on by the old buck—the dogs following tail-on-end. I thought I never saw deer run so fleetly; it appeared as if scarcely a score of seconds had transpired while they were crossing the savanna—more than a mile in width. I had a full and perfect view of the whole; there was no obstruction either to the run of the animals or the eye of the observer; the grass had been browsed short by the cattle, and not a bush grew upon the green plain; so that it was a trial of pure speed between dogs and deer. So swiftly ran the deer, I began to feel apprehensive about the venison.

My apprehensions were speedily at an end. Just on the farther edge of the savanna, the chase ended—so far at least as the dogs were concerned, and one of the deer. I saw that they had flung a doe, and were standing over her, one of them holding her by the throat.

I hurried forward. Ten minutes brought me to the spot; and, after a short struggle, the quarry was killed, and bled.

I was satisfied with my dogs, with the sport, with my own exploits. I was happy at the prospect of being able to redeem my promise; and with the carcass across my shoulders, I turned triumphantly homeward.

As I faced round, I saw the shadow of wings moving over the sunlit savanna. I looked upward. Two large birds were above me in the air; they were at no great height, nor were they endeavouring to mount higher. On the contrary, they were wheeling in spiral rings, that seemed to incline downward at each successive circuit they made around me.

At first glance, the sun's beams were in my eyes, and I could not tell what birds were flapping above me. On facing round, I had the sun in my favour; and his rays, glancing full upon the soft cream-coloured plumage, enabled me to recognise the species—they were *king vultures*—the most beautiful birds of their tribe, I am almost tempted to say the most beautiful birds in creation: certainly they take rank among those most distinguished in the world of ornithology.

These birds are natives of the flowery land, but stray no further north. Their haunt is on the green 'everglades' and wide savannas of Florida, on the llanos of the Orinoco, and the plains of the Apure. In Florida they are rare, though not in all parts of it; but their appearance in the neighbourhood of the plantations excites an interest similar to that which is occasioned by the flight of an eagle. Not so with the other vultures—*Cathartes aura* and *atratus*—both of which are common as crows.

In proof that the king vultures are rare, I may state that my sister had never seen one—except at a great distance; yet this young lady was twelve years of age, and a native of the land. True, she had not gone much abroad—seldom beyond the bounds of the plantation. I remember her expressing an ardent desire to view more closely one of these beautiful birds. I remembered it that moment; and at once formed the design of gratifying her wish.

The birds were near enough—so near that I could distinguish the deep yellow colour of their throats, the coral red upon their crowns, and the orange lappets

What cylinders!—what boilers! Oh to see her paddles working! (I hinted I had heard them, and they made a tolerable noise.) 'Of course, they did. What a sight she must have been coming up the river! I wish I had run down to the landing-stage—thousands did: it was crammed with people, watching her. She has been expected ever since spring; and this is her first voyage. You are sure you saw her?'

Yes; and I began to plume myself on the fact accordingly.

'She hasn't beat us yet, though; she was a day or two overdue—perhaps her engines were too new to work. She and the *Persia* will have a nice race for it back again, for they both sail for New York next week. Won't the captains clap on steam and go-ahead, rather! I wonder which will beat!'

Here the British mind became excited and enthusiastic. It certainly was exciting to think of, this racing on a grand scale, with iron steeds of from 2000 to 3000 horse-power, and the race-course the wide Atlantic. As for the stakes—a few hundred lives, more or less, to say nothing of money and property—these seemed supernumerary trifles.

'I should like to go aboard of her, and get a look at her engines,' was the prevailing sentiment of the next day or two, till it came at last—triumphant possibility!—to, 'Should you like to go aboard of her?'

Could a British woman resist such an invitation, following that of the Yankee captain to an enlightened British public?—which an enlightened British public had taken advantage of, and, in the most amiable manner, had gone by thousands, in river-steamers and row-boats, and all sorts of crafts, to examine our beautiful enemy, as she lay off Rock Ferry, alongside her rival the *Persia*, during two December days.

You would not have thought it was December, though, as we paced up and down the landing-stages, that curious trying-place, whence, as has been proved from accurate data, 40,000 people cross the Mersey every day, and the whole population of Liverpool cross in the course of a week. The new landing-stage, especially, forms an admirable promenade of a thousand yards long, with one trifling objection—the bridges which connect it with the quay are so short, that at low-water they slope in an angle of 45 degrees, down which an adventurous truck sometimes darts, to everybody's imminent danger. Once a commercial traveller's gig performed that feat with such an impetus, that it dashed right across the landing-stage, and popped into the river; whence it had to be fished out again, some wit recommending the owner 'to bait with a horse.'

To-day, being nearly high-water, no such accident diverted the incessantly changing swarm of all sorts of people which makes a Liverpool crowd a perpetual study—landsmen and seamen, big country farmers, men on 'Change, thin wiry Yankees, semi-gentlemanly bearded Jews, foreign sailors and sea-captains, with olive faces and gold ear-rings; women, too, of all sorts—from the handsome, overdressed 'Lancashire witches,' to the grimy old Irishwoman, a pipe in her mouth, and a load of herrings on her head, perfuming her whole route as she passes. A selection from these filled the Rock-Ferry boat, as we slowly steamed away up the river to the immortal tune of—may our transatlantic brethren appreciate the compliment!—*Bobbing around—around.*

It was an exquisite afternoon—full of that quiet all-permeating sunshine which, when you do get it, makes a December day the pleasantest of any for sight-seeing. The air was so clear, you could have counted every window in the houses along either shore; and the vessels, as we passed them by, seemed to stand up spar by spar, and rope by rope, cut out sharply against the cloudless sky. They seemed to me all alike; but some of our party talked learnedly

of 'schooner-rigged,' 'brig-rigged,' 'clipper,' &c.; seemed to have a personal acquaintance with every ship on the river: fought energetically over the sailing merits of the *James Baines* and the *Maggie*—something or other—and what had been the very shortest passage ever made between here and Australia. They pointed out, a short distance astern, a vessel—small enough she seemed—with her decks crowded, and lines of cabbages hanging to her lower rigging, being towed out by one of those sturdy little steam-tugs.

'She's an emigrant-ship, bound for Australia.'

'They'll be singing *Cheer, Boys, Cheer*,' said one, who knew all about it—at least for the first hour or two. Poor fellows! they'll need to sing it pretty often between Liverpool and Melbourne.'

And just then the echo of a faint dreary 'Hurrah!' came over the water, as if the poor fellows were trying hard to bid anybody and everybody a jolly good-bye, and start with a good grace for the 'new and happy land.'

Of course, the earth must be covered and civilised; and those who find Europe too full to hold them, are right to go forth into a new land, to replenish and subdue it; but to any with strong home-instincts, who feel that if native land held not a tie, they should still cling to the mere sod, to these—an emigrant-ship is one of the very saddest sights in the whole world: sadder far than one which met us shortly—a boat, pulled by ten boys in regulation nautical costume.

'Ah, that's the *Akbar's* boat, and there she is lying just off the quarantine station. Look at those lads now; how cheerily they pull, and what nice faces they have! You would never think they were all criminals.'

No. Certainly not. Round, rosy, honest, happy faces as ever I beheld! And yet these were, every one of them, belonging to what is called 'the criminal class,' vagabonds, if not thieves, who, coming under the lash of the law, had been sent, not to prison, where reformation would have been hopeless, but to this marine reformatory, where they are kept in safe custody, educated, taught a trade, or made sailors of. I do not know enough of this reformatory to write about it; but I know the sight of these ten apple-faced lads, pulling away merrily through the salt water, instead of skulking in a jail-yard—of the *Akbar*, rocking lazily, with long indefinite lines of boys' shirts flapping over her clean decks and ornamenting her useless rigging, instead of the stern stone-walls of your model prison or penitentiary—is a remembrance hopeful and pleasant to any one who thinks at all of that great question, to which no legislation has yet found an answer: 'What shall we do with our criminal classes?'

And now we came in sight of 'Jonathan's Pet'—that is, we had been in sight for ever so long, but my inexperienced eye had never detected her, or distinguished her from half-a-dozen other 'big ships.'

'Don't you see her? just athwart that old-fashioned, clumsy-built trader—wonderful craft that! Would do actually sixteen knots in sixteen hours! ha!—and modern superiority laughed heartily at the respectable 'slow coach' that no doubt was thought an astonishing ship in her day. 'That's the *Persia* to leeward, and there's the *Adriatic*. How small she looks!'

This certainly was the first impression she gave. To hear afterwards of her real proportions—354 feet in length, 32 feet broad, and 50 feet in depth, seemed perfectly ridiculous. No doubt it is her exquisite symmetry that takes from the sense of size, and makes her huge bulk look as graceful as a yacht. Seen foreshortened, sitting on the water as lightly, as airily as a swan on a stream, the slight clumsiness of build which struck me when I saw her longitudinally, steaming up the river, was not visible at all.

There are few things, of man's handiwork, more

beautiful than a ship afloat—even a steamer; and probably the *Adriatic* is one of the finest specimens of ship-building extant. The eye perfectly revels in her harmonious curves; not a line, from stem to stern, in which Hogarth's 'line of beauty and grace' does not soothe and fascinate one's organ of form. She is said to have been built after quite a new model, of which the only other specimen is the United States steam-frigate *Niagara*—her shape being studiously adapted to the course of the water when cleft by the ship's prow. Her chief peculiarity is the exceeding delicacy with which she tapers up to this prow, which, from her very small bowsprit, appears almost like a sharp point. As one of our party said: 'She looks as if after every voyage she would have to sharpen her nose upon a grindstone.'

As we neared her, and noticed how high she stood out of the water, how the boat-loads of people that kept crowding in seemed to be dispersed over her decks of no more account than a stray half-dozen or so, the impression of her size increased. As our boat lay to, waiting to come alongside, the learned of our company had opportunity fully to criticise the points of Jonathan's Pet, which they did with great gusto. I, unlearned and ignorant, could only gaze idly at a sociable party of sea-gulls, which swam from under her bows, apparently as tame and comfortable as a brood of ducks in a pond; and then at this gigantic floating palace, which had just made safely her first voyage. Her first voyage! As an ancient poet observes:

We cherish all our firsts throughout our lives—
Except first poems, and perhaps first wives.

And truly Captain James West—can that be he leaning over the side, and giving orders about the ship's ladder? that it may be made as easy as possible for the ascent of ladies who have not been accustomed to mount a fire-escape to a third-floor window—must feel truly thankful when he thinks of the *Adriatic's* first voyage successfully over. The first of how many? Heaven only knows.

We were on board at last. Most people, in those travelling days, are familiar with the interior of the magnificent ocean-steamers, where every luxury of furniture, living and sleeping accommodation, is provided for a fortunate passenger—subject only to the slight drawbacks of sea-sickness, drowning, burning, famishing, or blowing up. Those splendid cabins, all velvet and mirrors—where you might have every opportunity of becoming acquainted with your own personal appearance between here and America—those dainty, tiny, bed-chambers, so well-lighted and ventilated—those long dinner-tables—and the steward's pantry, where a most intelligent but thin Yankee stands, with an air half civil and half condescending—'You may walk in, ladies;' and watches with a grand indifference our admiration at the beautiful 'crockery' and glass, packed so ingeniously, that one imagines the fiercest hurricane of the Atlantic could not crack a single plate. Truly a voyage in the *Adriatic* would be exceedingly pleasant, if all things were warranted—weather included—to be always as they appear when she lies in the Mersey river.

But—her engines. The scientific mind evidently thought every minute lost that was not spent in the examination of her engines. So we hurriedly ran through the passenger domains, first and second class—the second-class berths and cabins being, by the way, uncommonly comfortable—brushed past the stewardess, who, immersed in a pile of haberdashery, we overheard giving a mild order for 'four hundred and sixty pair of blankets!'—paced rapidly from end to end of the upper or spar deck—peered down the hold, an awful cavern, fifty feet in depth—and finally made our way into the engine-gallery.

Perhaps, of all human handiwork, there is nothing grander than a fine piece of machinery—especially a steam-engine. I own to have been literally awed at sight of this one—this dumb monster of shiny brass and dark solid iron—with its enormous cylinders moulded as accurately as a silver flower-bell ornamenting a tea-pot, and as bright as the best housewife's best 'family-plate:' with its crank—after looking at which, as some one said, the adjective 'cranky' appeared an extraordinary misuse of words; and its piston-rod, which, moving up and down, must look as terrible, remorseless, and unswerving as the great arm of justice.

'Oh, to see it working!' was the sigh of enthusiastic professional appreciation: 'with those eight boilers, and those forty-eight furnaces—and all that mass of machinery! Working—working night and day like a blind giant, who doesn't know what he is, or why he is, or where he is going, but just goes labouring on, till something or some one brings him to a dead stop. Really, I think we have a good many points in common with a big steam-engine.'

I hinted that we were not quite such irresponsible machinery; that we at least knew the Hand that built us and set us agoing. But contemplating this great mass of inert matter, which a few breaths of vapour would make all alive and instinct with power, for good or evil, set afloat on the wide ocean, where it became a mere atom of nothingness; yet had to hold on its way, labouring in darkness, but labouring ever—verily, the steam-engine did seem not very unlike us.

The 'Novelty Works, New York'—so said a brass inscription over its head—have need to be proud of this their magnificent monster, every inch of which is as daintily finished as the workmanship of a lady's watch. It is contrived, they say, with great saving of space and economy of fuel—the 1400 tons of coal which it has to devour in a single voyage, being considered quite a light provender. In return, the quantity of fresh water which it produces by condensation of its steam, supplies the ship abundantly. All that seemed wanting was, that it should manufacture its own gas; and various admirable schemes to that effect were started by our party, wanting only two qualities, practicability and safety. It did strike a non-professional auditor, whose two great terrors in life are gas and the stormy ocean, that to be exposed to the perils of both would a little detract from the pleasures of the trip; but that idea was scouted contemptuously by all the rest. No doubt those labyrinthine passages of cabins, so exactly similar, that No. 150 must find his or her berth, if found at all, by the merest accident, will ere long be illuminated like our streets and squares; and instead of 'Douse the glim,' the word will be: 'Turn off the meter.'

Strange to think of that huge floating castle—quite a little town—steaming on through the darkness, with all its sleeping freight, of which even the list of the crew reads as follows: '1 commander, 4 mates, 1 surgeon, 1 purser, 4 quarter-masters, 2 carpenters, 1 boatswain, 36 seamen, 1 engineer, 3 assistants, 6 superintendents of fires and boilers, 4 oilers (!), 2 engineers' storekeepers, 24 firemen, 36 coal-passers, 1 steward, 8 assistants, 36 waiters, 3 stewardesses, 2 storekeepers, 1 bar-keeper, 1 barber, 1 chief-cook, 1 assistant-cook, 1 baker, 2 pastry-cooks, 2 engineers' mess-men, 2 keepers of lamps and oil, 1 hose-keeper.'

And the safety of all, with indefinite passengers besides, dependent, humanly speaking, on that one head of the 'one commander.' It had need be a sound head and a steady one, and deserves a comfortable berth to rest in; which it evidently has, judging by the elegant appearance of the captain's state-rooms, into which we peered. Then we wandered up and down desultorily, wondering where on earth all this crew of 188, and all the hundreds of visitors that we

knew were on board, had vanished to. The great ship had swallowed them up, and they only appeared as stray groups here and there, or solitary sailors leaning over the side. No bustle, no confusion, and yet she was to sail to-morrow. There could not be a greater proof of the huge size and admirable arrangements of Brother Jonathan's Pet.

'Any one going back by the next boat?' Yes; about 300 or so, who, appearing out of inconceivable nooks, descended the ship's side, and crowded the river-boat on every square foot which two other feet could take possession of. In five minutes we had dropped astern, and saw the great hull of the *Adriatic* gradually lessening to that slender shape into which she dwindles at a very slight distance. As she lay with her stars and stripes streaming against the still clear sky, and the red winter sunset throwing its glow upon her great motionless paddle-wheels, we heartily wished her good-speed. Ay, even though our own *Persia* lay, a short space off, pluming her feathers for the flight, for she was to sail two days after, and as we repeated: 'Wouldn't her captain clap on steam, and run her, literally, to within an inch of her life, rather than be beaten by the Yankee!'

Happy, harmless rivalry! As we watched the two steamers lying so peacefully alongside, with the fair evening light upon them both—the sun going down towards the other continent as grandly as he had risen with us this morning, 'making no step-bairns' between east and west—one could not help trusting that the Governor of all the kingdoms of the earth would keep both the good ships safe, and that fast-sailing might be the only rivalry, the only war between ourselves and Brother Jonathan.

INDICTMENTS.

Our forefathers had a good many methods of ascertaining the guilt or innocence of an accused person, all of them considered equally infallible. The most ancient, probably, was the trial by ordeal, distinguished by the appellation of *judicium Dei*, and divided into two kinds—the fire ordeal for persons of high rank, and the water ordeal for those of lesser estate. Both these might be, and often were performed by deputy, the accused himself answering for the success of the trial, and there still lingers in our common speech the expression of 'going through fire and water' to serve a friend; and friendship, as well as a large reward, was in former times not unfrequently sufficient to stimulate one person to undertake this supposed purgation for another.

The ordeal by fire consisted either in holding unhurt for some minutes a piece of red-hot iron of one, two, or three pounds' weight, or else by walking bare-foot and blindfold over nine red-hot ploughshares, laid across the path at varying distances. Queen Emma, the mother of the Confessor, underwent, it is said, this trial at the west end of Winchester Cathedral, when an accusation was preferred against her of improper familiarity with Alwyn, bishop of that city; and this story, although received with some discredit, was strongly confirmed some fifty years back by the discovery, far below the surface, of a large quantity of half-decayed, and very ancient, ploughshares.

As of the fire, so of the water ordeal, there were two kinds—one being effected by plunging the bared arm to the elbow in boiling water, and escaping uninjured; the other in being thrown into a pond or river, when, if the unfortunate sank, he was adjudged innocent, while if he floated without any apparent effort to retain himself on the surface of the water, he was considered guilty; the idea being, that having, by his persevering denial of his guilt, renounced the benefits of his baptism, the element of water would not receive him.

The practice of trial by ordeal was put an end to in

our own land by act of parliament in the reign of Henry III., but retained in other countries until a much later date; and in many continental churches there yet remain representations of persons undergoing the ordeal—votive offerings made by those who were fortunate enough to escape uninjured. A very fine instance occurs in the cathedral church of Abbeville, where a lady of high rank, dressed in rich attire, is seen plunging her arm in a caldron of boiling water, and a multitude of beholders with most expressive countenances are standing around, awaiting the result.

Then there was the *coroned*, or morsel of execration—a piece of unleavened bread, or of cheese made of ewe's milk in the month of May, and weighing about an ounce—which after being consecrated by a prayer pronounced over it, that the Almighty would cause the eater to undergo pain and convulsions, if guilty, but impart to him health and nourishment, if innocent, was taken by the suspected person, together with the holy sacrament. Everybody knows the story of Godwin, Earl of Kent, attempting to exculpate himself from the death of the king's brother, and how the *coroned* stuck in his throat and killed him. The *coroned* has, ages ago, been abandoned by us, but it yet lingers in various forms in certain uncivilised parts of the world, and is there resorted to as a favourite way of settling dark and intricate accusations. The most amusing relic of it is in Monomotapa, in South Africa, where the accuser chews the bark of a tree remarkable for its emetic properties, and spits it out into certain water, which the accused is obliged to drink. If the water is rejected, he is condemned; while if it remains on his stomach, he is absolved, unless the accuser will drink some of the same water, and if it produces no effect on him either, neither the guilt nor the innocence of the accused is determined.

Another amusing method of trial, common throughout Christian countries in early times, was called *judicium crucis*. Each party, or his champion, stretched out his arms before a crucifix, and the one soonest wearied, dropped his arms and lost the day. This method of trial was principally confined to disputes about property, and the most celebrated instance of its being resorted to occurred in France during the reign of Pepin, when the Archbishop of Paris and the Abbot of St Denis disputing about the patronage of a monastery, the king ordered that their respective champions should resort to this method of deciding the question. Both appeared in the chapel attached to the monastery, and held out for an almost incredible time; the spectators, we are told, *betting* as to their respective abilities. The bishop's champion first gave in, and the Archbishop of Paris consequently gained the day.

Besides these three modes of trial, there was the 'wager of battle,' in which the suspected party threw down his glove, and declared he would defend the same with his body, and where the prosecutor took up the gauntlet, and announced his determination of doing battle, body for body.

This last mode of appealing to Heaven to assert the truth or falsehood of a charge, although long fallen into disuse, did not cease to be supported by the authority of the law till so late as 1819.

From these fallacious, and often no doubt fraudulent proceedings, our ancestors gradually turned to the most perfect, and, so far as the liberty of the subject is concerned, to the most important mode of trial ever invented—the trial 'by the country'—or in ordinary language, the 'trial by jury.'

The excellence of this mode of trial consists, as its name imports, in the fact that by it a man is tried by his peers or fellows. The sovereign, upon complaint of an injured party, lays before the head men of a county—assembled together under the name of the grand jury, and solemnly sworn not to act unjustly to any person out of 'hatred or malice, or through fear,

favour, affection, gain, reward, or the hope or promise thereof—an accusation drawn out upon parchment, of some particular person, charging him with a crime. When the grand jury have carefully considered the evidence to be brought forward in support of such accusation, they either say—or, in legal phraseology, 'present'—that such accusation is true, or else that they are ignorant whether it be true or false; the latter being in effect a dismissal by them of the charge.

This preliminary inquiry, however carped at at the present day, is without doubt one of the most important measures relating to the liberty of the subject. From their high and independent position, the members of the grand jury are unlikely to be influenced in their doings by any party-feeling; by law, they can in no case be called upon to account for any of their proceedings; and by their oath, and the practice pursued in relation to those proceedings, all their deliberations are kept profoundly secret. We imagine that no better plan could possibly be devised of placing a barrier between the power of the crown and a defenceless subject, and we hope that the day is yet very distant when this ancient institution will be abolished.

The written accusation to which we have alluded, when laid before the grand jury, is called a 'bill;' when presented by them, it is termed an 'indictment.'

We have elsewhere alluded to the manner in which a prisoner is put upon his trial on such indictment, and how the petty jury take the matter in hand, and ultimately declare upon his innocence or guilt; and therefore, in the present article, we propose to deal only with a few matters relating to these written accusations themselves.

One of the most universal maxims of the criminal law, and perhaps one of the most important, is that learnedly expressed by Lord Coke in the fourth book of his *Reports*: '*Nemo debet bis puniri pro uno delicto*,' well known to everybody in this country in its English dress of 'No one can be punished twice for the same offence.' As the mere *trial* of a person for a presumed crime is, if not a direct punishment, at all events a vexation, this maxim has very long ago been extended in its terms, and now pretty universally runs: '*Nemo debet bis vexari pro uno delicto*.'—'No one may be twice vexed (or tried) for the same cause.'

Our forefathers, in order to convey to alleged culprits the full benefits suggested by these old maxims, established the practice to which we have just alluded, of drawing out in exact and formal language the specific charge alleged against the accused person, and of binding themselves to prove upon the trial that exact charge, and that only—tacitly agreeing, that if they failed in establishing the perpetration of the offence in the very manner as stated in the indictment, the prisoner should be entitled to his acquittal.

By this proceeding, two great advantages were opened to an accused person: the one, that he could not have a vague indefinite charge brought against him at the time of his trial, to be shifted and altered as the evidence itself varied; the other, that he knew beforehand what was to be alleged against him, and therefore had better opportunity of preparing himself with an answer—two advantages which, if we consider the summary and often unfair manner in which legal inquiries were in former times conducted, were of no small importance.

But though, as we before said, our ancestors were anxious to allege a *specific* charge against an offender, their idea of a specific charge was somewhat peculiar. We in modern times, for instance, consider that to accuse a man of committing a murder of a particular person on a certain day, is pretty specific; but in times bygone, such a charge would have been considered very general in its character. The year of the sovereign's reign, the weapon of offence, with its value,

the position of the wound, with its length and depth, the various places to which the sufferer removed before he died, and a multitude of other minute circumstances, had all to be set forth, and the most trifling error in any one of them would have proved fatal to the instrument.

But in addition to this, for some reason altogether undiscoverable to us at the present day, the indictment was universally drawn out in abbreviated Latin, a misspelling in which, however unimportant in other respects, was deemed sufficient to destroy the instrument.

It was indeed a rule with lawyers of that day, that no word which *could* be expressed in Latin should in an indictment be written in English; and we continually find such documents being set aside for breaches of this regulation. In one case, the term 'witchcraft' rendered the instrument void, 'incantatio' being deemed the correct word; and in another, 'de la Fabre' was declared inadmissible in any other garb than a Latin one. So with misspelling: a man was indicted in Elizabeth's reign for murder; some unfortunate clerk spelt the word 'destructionem' 'destructionem,' and the error being discovered, the prisoner was immediately acquitted. More recently, 'duodecim' occurring for 'duodecem,' invalidated the instrument; and 'presentant' for 'presentatum' had a similar effect.

The great danger which was thus continually encountered, on the one hand, of placing in indictments English words which might be expressed by Latin ones; and on the other, of introducing Latin words not of sufficiently general acceptance to be used in an instrument, the meaning of which was to be patent to every one, led to the custom of using an *Anglicè* where any doubtful Latin word occurred. Thus, in one old indictment, we read of a man stealing certain *ollas æarias*—*Anglicè*, 'brass pots.'

The frequent acquittals which took place, owing to this severe way of construing indictments, soon led to a serious outcry on the part of the profession, and of the public generally, and so early as 1650, we find even the great Sir Matthew, who was in no way favourable to changes in the law, solemnly declaring his opinion on the subject in the following terms:

'In favour of life, great strictness has at all times been required in point of indictments, and the truth is that it has grown to be a blemish and inconvenience in the law and the administration thereof that more offenders escape by the over-easy ear given to exceptions in indictments than by their own innocence.'

After such an expostulation as this from so high a quarter, it appears remarkable that nearly one hundred years should be suffered to elapse before the legislature took any decided step to simplify and amend these proceedings. Day by day, indictments were quashed by wholesale—the non-crossing of a *t*, or non-dotting of an *i*, was almost sufficient, under the stringent practice of olden times, to avoid the instrument. So great *certainly*, as it was called, was required, that calling an 'accessory' a 'confederate' was fatal; and particular *words of art* were considered so essential in certain crimes, that without them the indictment was useless. Thus, if a man was accused of treason, it must be alleged that he committed that offence 'treasonably and against his allegiance,' and any alteration, however small, in this form made the indictment void. So in murder, the accused must 'feloniously, wilfully, and of his malice aforethought, kill and murder;' in stealing, he must be stated to have feloniously 'taken and carried away.' In murder, the depth of the wound must be set forth, that it might appear to the court to be sufficient to cause death; 'though,' says an old writer, 'if it be stated to have gone *through* the body, a statement of the depth is immaterial, for it will then

of itself appear sufficient to have caused death.' The charge that A. did 'steal, take, and carry away,' omitting 'feloniously,' has several times occurred, and has always been held fatal; and so in bigamy, the accusation that B. feloniously married one C., his former wife D. being then alive, was held altogether insufficient, the proper form being, that B., 'with force and arms, feloniously married one C., his former wife being still alive,' &c.

But above all, the value of the thing stolen in larceny, and of the instrument which caused the death in homicide, were always required to be stated. In larceny, because if the value amounted to twelve pence, the crime was *grand larceny*; if under that sum, *petty larceny*—two crimes which, in olden times, were very differently punished, the former incurring the punishment of death; the latter, of whipping and imprisonment only. In homicide, the value was required in consequence of the existence, until a few years back, of the laws relating to *deodands*, about which very curious subject we must say a few words.

According to ancient custom, whatever chattel was the immediate occasion of the death of any reasonable creature, became forfeited to holy church, and was applied, before the Reformation, towards obtaining masses for the deceased's soul, just as was the apparel of every stranger found dead, and subsequently was distributed in alms by the king's high almoner.

These forfeited articles were called *deodands*, from *Deo-dandum* (to be given to God); and Britton tells us, in his *Pleas of the Crown*, that the intention of the forfeiture was, that nothing which was the immediate cause of so awful an event as the death of a reasonable creature, should seem to go unpunished; but this assertion of the early lawyer has been much disputed, for the law allowed no *deodand* upon the death of an infant under years of discretion; thus favouring the idea that the intention of these forfeitures was simply to procure the means of conducting a religious ceremony after the death, and for the benefit of the soul of the deceased; for no mass or other purgation was necessary upon the death of an infant.

The rules relating to *deodands* are not by any means free from obscurity, either as to their origin or intention. If anything *without motion* was the cause of death, only that part of it immediately connected with the death was forfeited; but if the body was actually moving, the whole of it became a *deodand*.

Thus, when a man climbing into a cart at rest, fell off the wheel and was killed, the wheel only was the king's property; but when in another case the cart was moving at the time of the accident, the whole of it, with its load, was forfeited. So, again, where a man fell from the side of a ship going down a river, and was killed, strictly speaking, the whole ship, whatever its size or value, was a *deodand*; but if while on the deck a bale of goods fell upon and killed him, the bale only was a forfeiture, for he was himself moving in the ship, and so far as his death was concerned, the whole ship might be considered to be at rest.

The golden rule about these forfeitures was, 'whatever moves to the death is a *deodand*;' and in the quaint old book called *Termes de la Ley*, it is thus expressed:

Whatever moved to kill the dead,
Is *deodand*, and forfeited.

The most curious illustration of this rule is to be found in an ancient case, where a man fell from a mill-wheel into the stream, and was drowned, every part of the machinery *actually in motion* at the time was declared to be a *deodand*—that at rest, not.

This forfeiture of valuable articles, often without any blame at all being attachable to their owners, was found to be so oppressive, that, in modern times, a practice was adopted by juries, of finding as a *deodand* the money value of the thing, instead of the thing

itself; this money value being in many cases merely nominal.

It was not until the year 1699 that any improvement whatever began to be effected in the matter of indictments. An act then passed which made it compulsory on the clerk of the crown, when any indictment was found defective in form, to draw a fresh instrument without any fee, or, in default, to forfeit L.5 and costs. This, although it imposed a salutary check upon the carelessness of officials employed in the drawing up of such documents, did nothing at all towards providing for their amendment of defects discovered in them. In 1731, an important act was passed, which entirely abolished the use of Latin in law proceedings, and provided that all such, indictments included, should for the future be in English. In 1827, a further and a grand improvement was made by the legislature enacting, that merely formal errors in indictments should not invalidate them, but upon exceptions being taken, such should be amendable by the judge on the trial. Still, however, all the long legal phraseology was retained, and regarded with as much jealousy as ever; and it was not until her present majesty had been fourteen years upon the throne, that the *coup de grace* was given to these fearfully long-winded and complex instruments.

It would be wearying to writer as well as to reader to attempt to set forth, in any regular order, the vast improvements which the last statute introduced into these documents; we cannot better inform the reader's mind upon the subject, and at the same time illustrate how useless forms and unnecessary phraseology may be got rid of, when any one is bold enough to set heartily at work upon the subject of their reformation, than by setting forth the two forms of indictment respectively used before and after the passing of such statute.

We will suppose that a certain John Smith, being angry with a woman, Frances Bolt, throws a candlestick at, and kills her.

Now, the old form of indictment against John Smith would, in its very shortest form, be thus worded:

Middlesex to wit.—The jurors for our lord the king, upon their oaths present, that John Smith, late of Westminster, in the county of Middlesex, labourer, not having the fear of God before his eyes, but being moved and seduced by the instigation of the devil, on the first day of May, in the fourth year of the reign of our sovereign lord George the Third, by the grace of God, King of Great Britain, France, and Ireland, defender of the faith, and so forth, with force and arms at Westminster aforesaid, in the county aforesaid, in and upon one Frances, the wife of one William Bolt, late of Westminster aforesaid, carpenter, in the peace of God and our said lord the king, then and there being, feloniously, wilfully, and of his malice aforethought, did make an assault; and that he, the said John Smith, a certain brass candlestick of the value of one shilling, which he in his right hand then and there had, and held, did then and there, at and against the said Frances, cast and throw; and with such candlestick aforesaid, so cast and thrown by him, the said John Smith as aforesaid, in and upon the head of her, the said Frances, on the right side thereof, near to the temporal muscle, then and there feloniously, wilfully, and of his malice aforethought, did strike and bruise her, the said Frances, giving to her, the said Frances, then and there with the candlestick aforesaid, and by the stroke aforesaid, in manner aforesaid, in and upon the head of her, the said Frances, on the right side thereof, near to the temporal muscle, one mortal wound of the length of two inches, and of the depth of half an inch, of which said mortal wound, she, the said Frances, as well at Westminster aforesaid, in the county aforesaid, at divers other places in the said county, from the said first day of May in the year

aforesaid, until the second day of May in the same year, did languish, and languishing did live, on which second day of May at Westminster aforesaid, in the county aforesaid, she, the said Frances, of the mortal wound aforesaid, did die. And so the jurors aforesaid, upon their oaths aforesaid, do say that the said John Smith, her, the said Frances, in manner and form aforesaid, feloniously, wilfully, and of his malice aforethought, did kill and murder, against the peace of our lord the king, his crown, and dignity.

At the present day, the above lengthy document would be thus curtailed:

Middlesex to wit.—The jurors for our lady the Queen, upon their oaths present, that John Smith, late of Westminster, labourer, on the first day of May, in the year of our Lord 1852, feloniously, wilfully, and of his malice aforethought, did kill and murder Frances, the wife of William Bolt, against the peace of our lady the Queen, her crown, and dignity.

By the former of these two instruments, it would be incumbent upon the prosecution to prove the murder of Frances Bolt in the very manner stated, and if it turned out that by some other violence of the prisoner she met with her death, he would be acquitted on the indictment; by the latter, proof that the prisoner murdered the deceased in *any* way, would be sufficient to convict him.

It is not improbable that, after perusing the two documents, the reader may ask how it is that other long legal instruments connected with the common law, and especially with conveyancing, cannot also be shortened and simplified? For an answer to this question, we must refer him to those far wiser than ourselves in the theory and practice of the law.

OCEOLA:

A ROMANCE.

CHAPTER IX.—THE BATH.

‘YELLOW JAKE! the alligator!’

They were all the words I could utter. My mother entreated an explanation; I could not stay to give it. Frantic with apprehension, I tore myself away, leaving her in a state of terror that rivalled my own.

I run towards the hommock—the bath. I wait not to follow the devious route of the walk, but keep straight on, leaping over such obstacles as present themselves. I spring across the paling, and rush through the orangery, causing the branches to crackle and the fruit to fall. My ears are keenly bent to catch every sound.

Behind are sounds enough: I hear my mother's voice uttered in accents of terror. Already have her cries alarmed the house, and are echoed and answered by the domestics, both females and men. Dogs, startled by the sudden excitement, are baying within the enclosure, and fowls and caged birds screech in concert.

From behind come all these noises. It is not for them my ears are bent; I am listening *before* me.

In this direction I now hear sounds. The plashing of water is in my ears, and mingling with it the tones of a clear silvery voice—it is the voice of my sister! ‘Ha, ha, ha!’ The ring of laughter! Thank Heaven, she is safe!

I stay my step under the influence of a delicate thought; I call aloud:

‘Virgine! Virgine!’

Impatiently I await the reply. None reaches me; the noise of the water has drowned my voice?

I call again, and louder. ‘Virgine! sister! Virgine!’ I am heard, and hear:

‘Who calls? You, Georgy?’

‘Yes; it is I, Virgine.’

‘And pray, what want you, brother?’

‘O sister! come out of the bath.’

‘For what reason should I? Our friends come? They are early: let them wait, my Georgy. Go you and entertain them. I mean to enjoy myself this most beautiful of mornings; the water's just right—delightful! Isn't it, Viola? Ho! I shall have a swim round the pond: here goes!’

And then there was a fresh plashing in the water, mingled with a cheerful abandon of laughter in the voices of my sister and her maid.

I shouted at the top of my voice:

‘Hear me, Virgine! dear sister! For Heaven's sake, come out! come!’

There was a sudden cessation of the merry tones; then came a short sharp ejaculation, followed almost instantaneously by a wild scream. I perceived that neither was a reply to my appeal. I had called out in a tone of entreaty sufficient to have raised apprehension; but the voices that now reached me were uttered in accents of terror. In my sister's voice I heard the words:

‘See, Viola! O mercy—the monster! Ha! he is coming this way! O mercy! Help, George, help! Save—save me!’

Well knew I the meaning of the summons; too well could I comprehend the half-coherent words, and the continued screaming that succeeded them.

‘Sister, I come, I come!’

Quick as thought, I dashed forward, breaking through the boughs that still intercepted my view.

‘Oh, perhaps I shall be too late? She screams in agony; she is already in the grasp of the alligator!’

A dozen bounds carried me clear of the grove; and, gliding along the embankment of the turtle crawl, I stood by the edge of the tank. A fearful tableau was before me.

My sister was near the centre of the basin, swimming towards the edge. There stood the quadron—knee-deep—screeching and flinging her arms frantically in the air. Beyond, appeared the gigantic lizard; his whole body, arms, hands, and claws clearly traceable in the pellucid water, above the surface of which rose the scaly serrature of his back and shoulders. His snout and tail projected still higher; and with the latter he was lashing the water into white froth, that already mottled the surface of the pond. He was not ten feet from his intended victim. His gaunt jaws almost touched the green baize skirt that floated train-like behind her. At any moment, he might have darted forward and seized her.

My sister was swimming with all her might. She was a capital swimmer; but what could it avail? Her bathing-dress was impeding her; but what mattered that? The alligator might have seized her at any moment; with a single effort, could have caught her, and yet he had not made it.

I wondered why he had not; I wondered that he still held back. I wonder to this hour, for it is not yet explained. I can account for it only on one supposition: that he felt that his victim was perfectly within his power; and as the cat cajoles with the mouse, so was he indulging in the plenitude of his tyrant strength.

These observations were made in a single second of time—while I was cocking my rifle.

I aimed, and fired. There were but two places where the shot could have proved fatal—the eye or behind the forearm. I aimed for the eye. I hit the shoulder; but from that hard corrugated skin, my bullet glinted as from a granite rock. Among the rhomboid protuberances it made a whitish score, and that was all.

The play of the monster was brought to a termination. The shot appeared to have given him pain. At all events, it roused him to more earnest action, and perhaps impelled him to the final spring. He made it the instant after.

Lashing the water with his broad tail—as if to gain impetus—he darted forward; his huge jaw hinged vertically upward, till the red throat shewed wide agape; and the next moment the floating skirt—and oh! the limbs of my sister were in his horrid gripe!

I plunged in, and swam towards them. The gun I still carried in my grasp. It hindered me. I dropped it to the bottom, and swam on.

I caught Virgine in my arms. I was just in time, for the alligator was dragging her below.

With all my strength, I held her up: it needed all to keep us above the surface. I had no weapon; and if I had been armed, I could not have spared a hand to strike.

I shouted with all my voice, in the hope of intimidating the assailant, and causing him to let go his hold. It was to no purpose: he still held on.

O Heavens! we shall both be dragged under—drowned—devoured—

A plunge, as of one leaping from a high elevation into the pond—a quick, bold swimmer from the shore—a dark-skinned face, with long black hair that floats behind it on the water—a breast gleaming with bright spangles—a body clad in bead-embroidered garments—a man? a boy!

Who is this strange youth that rushes to our rescue?

He is already by our side—by the side of our terrible antagonist. With all the earnest energy of his look, he utters not a word. He rests one hand upon the shoulder of the huge lizard, and with a sudden spring places himself on its back. A rider could not have leaped more adroitly to the saddle.

A knife gleams in his uplifted hand. It descends—its blade is buried in the eye of the alligator!

The roar of the saurian betokens its pain. The earth vibrates with the sound; the froth flies up under the lashings of its tail, and a cloud of spray is flung over us. But the monster has now relaxed its gripe, and I am swimming with my sister to the shore.

A glance backward reveals to me a strange sight—I see the alligator diving to the bottom with the bold rider still upon its back! He is lost—he is lost!

With painful thoughts, I swim on. I climb out, and place my fainting sister upon the bank. I again look back.

Joy, joy! the strange youth is once more above the surface, and swimming freely to the shore. Upon the further side of the pond, the hideous form is also above water, struggling by the edge—frantic and furious with the agony of its wounds.

Joy, joy! my sister is unharmed. The floating skirt has saved her: scarcely a scratch shews upon her delicate limbs; and now in tender arms, amidst sweet words and looks of kind sympathy, she is borne away from the scene of her peril.

CHAPTER X.

THE 'HALF-BLOOD.'

The alligator was soon clubbed to death, and dragged to the shore—a work of delight to the blacks of the plantation.

No one suspected how the reptile had got to the pond—for I had not said a word to any one. The belief was that it had wandered there from the river, or the lagoons—as others had done before; and Yellow Jake, the most active of all in its destruction, was heard several times repeating this hypothesis! Little did the villain suspect that his secret was known. I thought that besides himself I was the only one privy to it; in this, however, I was mistaken.

The domestics had gone back to the house, 'toating' the huge carcass with ropes, and uttering shouts of triumph. I was alone with our gallant preserver. I stayed behind purposely to thank him.

Mother, father, all had given expression to their gratitude; all had signified their admiration of his gallant conduct: even my sister, who had recovered consciousness before being carried away, had thanked him with kind words.

He made no reply, further than to acknowledge the compliments paid him; and this he did either by a smile or a simple inclination of the head. With the years of a boy, he seemed to possess the gravity of a man.

He appeared about my own age and size. His figure was perfectly proportioned, and his face handsome. The complexion was not that of a pure Indian, though the style of his dress was so. His skin was nearer brunette than bronze: he was evidently a 'half-blood.'

His nose was slightly aquiline, which gave him that fine eagle-look peculiar to some of the North American tribes; and his eye, though mild in common mood, was easily lighted up. Under excitement, as I had just witnessed, it shone with the brilliancy of fire.

The admixture of Caucasian blood had tamed down the prominence of Indian features to a perfect regularity, without robbing them of their heroic grandeur of expression; and the black hair was finer than that of the pure native, though equally shining and luxuriant. In short, the *tout ensemble* of this strange youth was that of a noble and handsome boy, that another brace of summers would develop into a splendid-looking man. Even as a boy, there was an individuality about him, that, when once seen, was not to be forgotten.

I have said that his costume was Indian. So was it—purely Indian—not made up altogether of the spoils of the chase, for the buckskin has long ceased to be the wear of the aborigines of Florida. His moccasins alone were of dressed deer's hide; his leggings were of scarlet cloth; and his tunic of figured cotton stuff—all three elaborately beaded and embroidered. With these he wore a wampum belt, and a fillet encircled his head, above which rose erect three plumes from the tail of the king vulture—which among Indians is an eagle. Around his neck were strings of party-coloured beads, and upon his breast three demi-lunes of silver, suspended one above the other.

Thus was the youth attired; and, despite the soaking which his garments had received, he presented an aspect at once noble and picturesque.

'You are sure you have received no injury?' I inquired for the second time.

'Quite sure—not the slightest injury.'

'But you are wet through and through; let me offer you a change of clothes: mine, I think, would about fit you.'

'Thank you. I should not know how to wear them. The sun is strong: my own will soon be dry again.'

'You will come up to the house, and eat something?'

'I have eaten but a short while ago. I thank you. I am not in need.'

'Some wine?'

'Again I thank you—water is my only drink.'

I scarcely knew what to say to my new acquaintance. He refused all my offers of hospitality, and yet he remained by me. He would not accompany me to the house; and still he shewed no signs of taking his departure.

Was he expecting something else? A reward for his services? Something more substantial than complimentary phrases?

The thought was not unnatural. Handsome as was the youth, he was but an Indian. Of compliments he had had enough. Indians care little for idle words. It might be that he waited for something more: it was but natural for one in his condition to do so, and equally natural for one in mine to think so.

In an instant my purse was out; in the next, it was in his hands—and in the next it was at the bottom of the pond!

'I did not ask you for money,' said he, as he flung the dollars indignantly into the water.

I felt pique and shame; the latter predominated. I plunged into the pond, and dived under the surface. It was not after my purse, but my rifle, which I saw lying upon the rocks at the bottom. I gained the piece, and, carrying it ashore, handed it to him.

The peculiar smile with which he received it, told me that I had well corrected my error, and subdued his capricious pride.

'It is my turn to make reparation,' said he. 'Permit me to restore you your purse, and to ask pardon for my rudeness.'

Before I could interpose, he sprang into the water, and dived below the surface. He soon recovered the shining object, and returning to the bank, placed it in my hands.

'This is a splendid gift,' he said, handling the rifle, and examining it—'a splendid gift; and I must return home before I can offer you ought in return. We Indians have not much that the white man values—only our lands, I have been told'—he uttered this phrase with peculiar emphasis. 'Our rude manufactures,' continued he, are worthless things when put in comparison with those of your people—they are but curiosities to you at best. But stay—you are a hunter? Will you accept a pair of moccasins and a bullet-pouch? Maïmee makes them well'—

'Maïmee?'

'My sister. You will find the moccasin better for hunting than those heavy shoes you wear: the tread is more silent.'

'Above all things, I should like to have a pair of your moccasins.'

'I am rejoiced that it will gratify you. Maïmee shall make them, and the pouch too.'

'Maïmee!' I mentally echoed. 'Strange, sweet name! Can it be she?'

I was thinking of a bright being that had crossed my path—a dream—a heavenly vision—for it seemed too lovely to be of the earth.

While wandering in the woods, amid perfumed groves, had this vision appeared to me—in the form of an Indian maiden. In a flowery glade, I saw her—one of those spots in the southern forest which nature adorns so profusely. She appeared to form part of the picture.

One glance had I, and she was gone. I pursued, but to no purpose. Like a spirit she glided through the dædalian aisles of the grove, and I saw her no more. But though gone from my sight, she passed not out of my memory; ever since had I been dreaming of that lovely apparition. Was it Maïmee?

'Your name?' I inquired, as I saw the youth was about to depart.

'I am called Powell by the whites: my father's name—he was white—he is dead. My mother still lives; I need not say she is an Indian.'

'I must be gone, sir,' continued he after a pause. 'Before I leave you, permit me to ask a question. It may appear impertinent, but I have good reason for asking it. Have you among your slaves one who is very bad, one who is hostile to your family?'

'There is such a one. I have reason to believe it.'

'Would you know his tracks?'

'I should.'

'Then follow me!'

'It is not necessary. I can guess where you would lead me. I know all: he lured the alligator hither to destroy my sister.'

'Ugh!' exclaimed the young Indian, in some surprise. 'How learned you this, sir?'

'From yonder rock, I was a witness of the whole transaction. But how did you come to know of it?'

I asked in turn.

'Only by following the trail—the man—the dog—

the alligator. I was hunting by the swamp. I saw the tracks. I suspected something, and crossed the fields. I had reached the thicket when I heard cries. I was just in time. Ugh!'

'You were in good time, else the villain would have succeeded in his intent. Fear not, friend! he shall be punished.'

'Good—he should be punished. I hope you and I may meet again.'

A few words more were exchanged between us, and then we shook hands, and parted.

CHAPTER XI.

THE CHASE.

About the guilt of the mulatto, I had no longer any doubt. The mere destruction of the fish could not have been his design; he would never have taken such pains to accomplish so trifling a purpose. No; his intent was far more horrid; it comprehended a deeper scheme of cruelty and vengeance; its aim was my sister's life!—Viola's!—perhaps both?

Awful as was such a belief, there was no room left to doubt it; every circumstance confirmed it. Even the young Indian had formed the opinion that such was the design. At this season, my sister was in the habit of bathing almost every day; and that this was her custom was known to all upon the plantation. I had not thought of it when I went in pursuit of the deer, else I should in all probability have acted in a different manner. But who could have suspected such dire villainy?

The cunning of the act quite equalled its malice. By the merest accident, there were witnesses; but had there been none, it is probable the event would have answered the intention, and my sister's life been sacrificed.

Who could have told the author of the crime? The reptile would have been alone responsible. Even suspicion would not have rested upon the mulatto—how could it? The yellow villain had shewn a fiendish craft in his calculation.

I was burning with indignation. My poor innocent sister! Little did she know the foul means that had been made use of to put her in such peril. She was aware that the mulatto liked her not, but never dreamed she that she was the object of such a demoniac spite as this.

The very thoughts of it fired me, as I dwelt upon them. I could restrain myself no longer. The criminal must be brought to punishment, and at once. Some severe castigation must be inflicted upon him—something that would place it beyond his power to repeat such dangerous attempts.

How he would be dealt with, I could not tell—that must be left to my elders to determine. The lash had proved of no avail; perhaps the chain-gang would cure him—at all events, he must be banished the plantation.

In my own mind, I had not doomed him to death, though truly he deserved it. Indignant as I felt, I did not contemplate this ultimate punishment of crime; used to my father's mild rule, I did not. The lash—the county prison—the chain-gang at St Marks or San Augustine: some of these would likely be his reward.

I knew it would not be left to the lenient disposition of my father to decide. The whole community of planters was interested in a matter of this kind. An improvised jury would soon assemble. No doubt harsher judges than his own master would deal with the guilty man.

I stayed no longer to reflect; I was determined his trial should be immediate. I ran towards the house with the intention of declaring his guilt.

In my haste, as before, I did not follow the usual path, which was somewhat circumambient; I made direct through the grove.

I had advanced only a few paces, when I heard a rustling of the leaves near me. I could see no one, but felt sure that the noise was caused by some person skulking among the trees. Perhaps some of the field-hands, taking advantage of the confusion of the hour, and helping himself to a few oranges?

Compared with my purpose, such slight dereliction was a matter of no importance, and I did not think worth while to stay and hinder it. I only shouted out; but no one made answer, and I kept on.

On arriving at the rear of the house, I found my father in the enclosure by the grand shed—the overseer too. Old Hickman, the alligator-hunter, was there, and one or two other white men, who had casually come upon business.

In the presence of all, I made the disclosure; and, with as much minuteness as the time would permit, described the strange transaction I had witnessed in the morning.

All were thunderstruck. Hickman at once declared the probability of such a manoeuvre, though no one doubted my words. The only doubt was as to the mulatto's intent. Could it have been human lives he designed to sacrifice? It seemed too great a wickedness to be believed. It was too horrible even to be imagined!

At that moment all doubts were set at rest. Another testimony was added to mine, which supplied the link of proof that was wanting. Black Jake had a tale to tell, and told it.

That morning—but half an hour before—he had seen Yellow Jake climb up into a live oak that stood in one corner of the enclosure. The top of this commanded a view of the pond. It was just at the time that 'white missa' and Viola went to the bath. He was quite sure that about that time they must have been going into the water, and that Yellow Jake *must have seen them*.

Indignant at his indecorous conduct, the black had shouted to the mulatto to come down from the tree, and threatened to complain upon him. The latter made answer that he was only gathering acorns—the acorns of the live oak are sweet food, and much sought after by the plantation-people. Black Jake, however, was positive that this could not be Yellow Jake's purpose; for the former still continuing to threaten, the latter at length came down, and Black Jake saw no acorns—not one!

'Twan't acorn he war arter, Massa Randoff: daat yaller loafer want arter no good—daat he want sure sartin.'

So concluded the testimony of the groom.

The tale produced conviction in the minds of all. It was no longer possible to doubt of the mulatto's intention, horrible as it was. He had ascended the tree to be witness of the foul deed; he had seen them enter the basin; he knew the danger that was lurking in its waters; and yet he had made no movement to give the alarm. On the contrary, he was among the last who had hastened towards the pond, when the screaming of the girls was summoning all the household to their assistance. This was shewn by the evidence of others. The case was clear against him.

The tale produced a wild excitement. White men and black men, masters and slaves, were equally indignant at the horrid crime; and the cry went round the yard for 'Yellow Jake!'

Some ran one way, some another, in search of him—black, white, and yellow ran together—all eager in the pursuit—all desirous that such a monster should be brought to punishment.

Where was he? His name was called aloud, over

and over again, with commands, with threats; but no answer came back. Where was he?

The stables were searched, the shed, the kitchen, the cabins—even the corn-crib was ransacked—but to no purpose. Where had he gone?

He had been observed but the moment before—he had assisted in dragging the alligator. The men had brought it into the enclosure, and thrown it to the hogs to be devoured. Yellow Jake had been with them, active as any at the work. It was but the moment before he had gone away; but where? No one could tell!

At this moment, I remembered the rustling among the orange-trees. It might have been he? If so, he may have overheard the conversation between the young Indian and myself—or the last part of it—and if so, he would now be far away.

I led the pursuit through the orangery: its recesses were searched; he was not there.

The hommock thickets were next entered, and beaten from one end to the other; still no signs of the missing mulatto.

It occurred to me to climb up to the rock, my former place of observation. I ascended at once to its summit, and was rewarded for my trouble. At the first glance over the fields, I saw the fugitive. He was down between the rows of the indigo plants, crawling upon hands and knees, evidently making for the maize.

I did not stay to observe farther, but springing back to the ground, I ran after him. My father, Hickman, and others followed me.

The chase was not conducted in silence—no stratagem was used, and by our shouts the mulatto soon learned that he was seen and pursued. Concealment was no longer possible; and rising to his feet, he ran forward with all his speed. He soon entered the maize-field, with the hue and cry close upon his heels.

Though still but a boy, I was the fastest runner of the party. I knew that I could run faster than Yellow Jake, and if I could only keep him in sight, I should soon overtake him. His hopes were to get into the swamp, under cover of the palmetto thickets; once there, he might easily escape by hiding—at all events, he might get off for the time.

To prevent this, I ran at my utmost speed, and with success; for just upon the edge of the woods, I came up with the runaway and caught hold of the loose flap of his jacket.

It was altogether a foolish attempt upon my part. I had not reflected upon anything beyond getting up with him. I had never thought of resistance, though I might have expected it from a desperate man. Accustomed to be obeyed, I was under the hallucination that, as soon as I should come up, the fellow would yield to me; but I was mistaken.

He at once jerked himself free of my hold, and easily enough. My breath was gone, my strength exhausted—I could not have held a cat.

I expected him to run on as before; but instead of doing so, he stopped in his tracks, turned fiercely upon me, and drawing his knife, plunged it through my arm. It was my heart he had aimed at; but by suddenly throwing up my arm, I had warded off the fatal thrust.

A second time his knife was upraised—and I should have had a second stab from it—but, just then, another face shewed itself in the fray; and before the dangerous blade could descend, the strong arms of Black Jake were around my antagonist.

The fiend struggled fiercely to free himself; but the muscular grasp of his old rival never became relaxed until Hickman and others arrived upon the ground; and then a fast binding of thongs rendered him at once harmless and secure.

CHAPTER XII.

A SEVERE SENTENCE.

Such a series of violent incidents of course created excitement beyond our own boundaries. There was a group of plantations upon the river lying side by side, and all having a frontage upon the water; they formed the 'settlement.' Through these ran the report, spreading like wildfire; and within the hour, white men could be seen coming from every direction. Some were on foot—poor hunters who dwelt on the skirts of the large plantations; others—the planters themselves, or their overseers—on horseback. All carried weapons—rifles and pistols. A stranger might have supposed it the rendezvous of a militia 'muster,' but the serious looks of those who assembled gave it a different aspect: it more resembled the gathering of the frontier upon the report of some Indian invasion.

In one hour, more than fifty white men were upon the ground—nearly all who belonged to the settlement.

A jury was quickly formed, and Yellow Jake put upon his trial. There was no law in the proceedings, though legal formality was followed in a certain rude way. These jurors were themselves sovereign—they were the lords of the land, and, in cases like this, could easily improvise a judge. They soon found one in planter Ringgold, our adjoining neighbour. My father declined to take part in the proceedings.

The trial was rapidly gone through with. The facts were fresh and clear; I was before their eyes with my arm in a sling, badly cut. The other circumstances which led to this result were all detailed. The chain of guilt was complete. The mulatto had attempted the lives of white people. Of course, death was the decree.

What mode of death? Some voted for hanging; but by most of these men, hanging was deemed too mild. *Burning* met the approbation of the majority. The judge himself cast his vote for the severer sentence.

My father pled mercy—at least so far as to spare the torture—but the stern jurors would not listen to him. They had all lost slaves of late—many runaways had been reported—the proximity of the Indians gave encouragement to defection. They charged my father with too much leniency—the settlement needed an example—they would make one of Yellow Jake, that would deter all who were disposed to imitate him. His sentence was, that he should be *burnt alive*!

Thus did they reason, and thus did they pronounce.

It is a grand error to suppose that the Indians of North America have been peculiar in the habit of torturing their captive foes. In most well-authenticated cases, where cruelty has been practised by them, there has been a provocative deed of anterior date—some grievous wrong—and the torture was but a retaliation. Human nature has yielded to the temptings of revenge in all ages—and ferocity can be charged with as much justice against white skin as against red skin. Had the Indians written the story of border warfare, the world might have modified its belief in their so-called cruelty.

It is doubtful if, in all their history, instances of ferocity can be found that will parallel those often perpetrated by white men upon blacks—many of whom have suffered mutilation—torture—death—for the mere offence of a word! certainly often for a blow, since such is a written law!

Where the Indians have practised cruelty, it has almost always been in retaliation; but civilised tyrants have put men to the torture without even the palliating apology of vengeance. If there was revenge, it was not of that natural kind to which the human heart gives way, when it conceives deep wrong has been done; but rather a mean spite, such as is often

exhibited by the dastard despot towards some weak individual within his power.

No doubt, Yellow Jake deserved death. His crimes were capital ones; but to *torture* him was the will of his judges.

My father opposed it, and a few others. They were outvoted and overruled. The awful sentence was passed; and they who had decreed it at once set about carrying it into execution.

It was not a fit scene to be enacted upon a gentleman's premises; and a spot was selected at some distance from the house, further down the lake-edge. To this place the criminal was conducted—the crowd of course following.

Some two hundred yards from the bank, a tree was chosen as the place of execution. To this tree the condemned was to be bound, and a log-fire kindled around him.

My father would not witness the execution; I alone of our family followed to the scene. The mulatto saw me, and accosted me with words of rage. He even taunted me about the wound he had given, glorying in the deed. He was no doubt under the belief that I was one of his greatest foes. I had certainly been the innocent witness of his crime, and chiefly through my testimony he had been condemned; but I was not revengeful. I would have spared him the terrible fate he was about to undergo—at least its tortures.

We arrived upon the ground. Men were already before us, collecting the logs, and piling them up around the trunk of the tree; others were striking a fire. Some joked and laughed; a few were heard giving utterance to expressions of hate for the whole coloured race.

Young Ringgold was especially active. This was a wild youth—on the eve of manhood, of somewhat fierce, harsh temper—a family characteristic.

I knew that the young fellow affected my sister Virginia; I had often noticed his partiality for her; and he could scarcely conceal his jealousy of others who came near her. His father was the richest planter in the settlement; and the son, proud of this superiority, believed himself welcome everywhere. I did not think he was very welcome with Virgine, though I could not tell. It was too delicate a point upon which to question her, for the little dame already esteemed herself a woman.

Ringgold was neither handsome nor graceful. He was sufficiently intelligent, but overbearing to those beneath him in station—not an uncommon fault among the sons of rich men. He had already gained the character of being resentful. In addition to all, he was dissipated—too often found with low company in the forest cock-pit.

For my part, I did not like him. I never cared to be with him as a companion; he was older than myself, but it was not that—I did not like his disposition. Not so my father and mother. By both was he encouraged to frequent our house. Both probably desired him for a future son-in-law. They saw no faults in him. The glitter of gold has a blinding influence upon the moral eye.

This young man, then, was one of the most eager for the punishment of the mulatto, and active in the preparations. His activity arose partly from a natural disposition to be cruel. Both he and his father were noted as hard task-masters, and to be 'sold to Mass' Ringgold was a fate dreaded by every slave in the settlement.

But young Ringgold had another motive for his conspicuous behaviour: he fancied he was playing the knight-errant, by this show of friendship for our family—for Virginia. He was mistaken. Such unnecessary cruelty to the criminal met the approbation of none of us. It was not likely to purchase a smile from my good sister.

The young half-blood, Powell, was also present. On hearing the hue and cry, he had returned, and now stood in the crowd looking on, but taking no part in the proceedings.

Just then the eye of Ringgold rested upon the Indian boy, and I could perceive that it was instantly lit up by a strange expression. He was already in possession of all the details. He saw in the dark-skinned youth the gallant preserver of Virginia's life, but it was not with gratitude that he viewed him. Another feeling was working in his breast, as could plainly be perceived by the scornful curl that played upon his lips.

More plainly still by the rude speech that followed: 'Hillo! redskin!' he cried out, addressing himself to the young Indian, 'you're sure you had no hand in this business? eh, redskin?'

'Redskin!' exclaimed the half-blood in a tone of indignation, at the same time fronting proudly to his insulter—'Redskin you call me? My skin is of better colour than yours, you white-livered lout!'

Ringgold was rather of a sallow complexion. The blow hit home. Not quicker is the flash of powder than was its effect; but his astonishment at being thus accosted by an Indian, combined with his rage, hindered him for some moments from making reply.

Others were before him, and cried out:

'O Lordy! such talk from an Injun!'

'Say that again!' cried Ringgold, as soon as he had recovered himself.

'Again if you wish—white-livered lout!' cried the half-blood, giving full emphasis to the phrase.

The words were scarcely out before Ringgold's pistol cracked; but the bullet missed its aim; and next moment the two clinched, seizing each other by the throats.

Both came to the ground, but the half-blood had the advantage. He was uppermost, and no doubt would quickly have despatched his white antagonist—for the ready blade was gleaming in his grasp—but the knife was struck out of his hand; and a crowd of men, rushing to the spot, pulled the combatants apart.

Some were loud against the Indian lad, and called for his life; but there were others with finer ideas of fair-play, who had witnessed the provocation, and, despite the power of the Ringolds, would not suffer him to be sacrificed. I had resolved to protect him as far as I was able.

What would have been the result, it is difficult to guess; but, at that crisis a sudden diversion was produced by the cry—that *Yellow Jake had escaped!*

A CHRISTMAS BARREL OF OYSTERS.

DID you ever hear that the London commissariat alone demands every year five hundred million oysters; and that Manchester, Liverpool, Birmingham, Bristol, and other places take all they can get, and never get half enough? Are you further aware that there are numerous companies who cultivate, or grow, or nurse oysters for the market; who procure them in the seed, who place them in watery pits, and tend them with anxious care, for three long years, till they are ready to enter 'oyster street,' and make their debut at the court of Billingsgate? And are you further aware that poets have sung about oysters, that legislators have legislated about oysters, that naturalists have investigated their manners and habits; and that, after all, nothing is known about them? If you know all this, you will perhaps listen with some interest to our talk about oysters.

Nobody can tell how oysters reproduce themselves. All we know is, that, according to an anonymous authority, in spring-time and summer they sicken and spawn their gelatinous green-hued splashies, which the fishermen have baptised *spat*. The spawn looks like drops of tallow or greenish-coloured soup, and it

adheres to loose oyster-shells and stones. When examined with a magnifying-glass, there are seen in the spat numerous little eggs of a brilliant whiteness; which gradually become compressed, and approach more and more the shape of an oyster. Little hairs appear as the egg-cluster breaks up, and the thousands of the brother and sister *ostrea* swim off to seek their fortunes. When the steady age comes—rather say the steady hour—the settling-down epoch, the hairs give place to layers of rough shell, and a *native* of experience takes care to set up house where he can eat with least risk of being eaten. Microscopists reckon the eggs in one of these splashies of spat by hundreds of thousands. Leuwenhoek counted several hundred thousand eggs in the fecundating folds of the mantle of an oyster-spawner; and it has been said, but on whose authority we do not know, that when an oyster attains the fourth month of its age, it can reproduce its species. This remarkable fecundity is necessary to enable the species to survive the ravages which the spawn sustain from their numerous enemies. The spat is a tidbit for fish, crustacea, and worms. The feelers or tentacles of numberless cannibals are cast forth continually, to lay hold of the young and innocent natives. When their shells are sufficiently grown to protect them from such enemies, star-fishes and crabs watch continually to take them by surprise, and whip the soft and succulent bodies of the *ostrea* from their valves. Many a five-fingered star-fish loses a member in the attempt when the oyster is wide awake, and closes his valves upon it with a sudden and powerful snap. M. Corte informs us that a single shell contains from one to two millions of young oysters. In reference to the growth of this much-prized mollusk: 'Stakes fixed thirty months before in the Lake of Fusaro, when removed, were loaded with oysters; and, in spite of the numerous varieties of shape, they were found to be the produce of three distinct seasons. Those which were of the first year's spawning were ready for sale; those of the second year were quite small; and the third batch were only about the size of a lentil.'

Some of the London fish-salesmen do business in nothing but oysters, while others confine themselves entirely to the trade in lobsters. To meet the enormous demand for natives, and to fill the wonderful quantity of Christmas barrels which are travelling all over our southern railways during the month of December, cultivation and protection on a large scale is resorted to; and the more seaward parts of the Thames, on both the Kentish and Essex coasts, may be said to have been long ago converted into a series of oyster-farms or beds, of various sizes. In all these beds, we are informed by Sir Francis Head, 'there is a certain space devoted to natives. At Burnham, Essex, the spat, or fecundated sperm, is stored in large pits, and sold as native brood, which is afterwards "laid" in that portion of the different beds appropriated to privileged oysters. Here the young natives remain for three years, when they are generally brought to market. So far, their education is left, in a certain degree, to nature; but once in the possession of the fish-shopkeepers, art steps in to perfect their condition. They are now stored in large shallow vats, being carefully laid with their proper sides uppermost, and supplied daily with oat-méal—a process which is calculated rather to fatten than to flavour; and there are many who think that, like show-cattle, they are none the better for over-feeding.' Such is a brief outline of the organisation constantly at work to supply our markets with this one delicacy; and the tavern roysterer little thinks of the care and anxiety endured, or the multiplicity of operations which are performed before his dozen of natives reach the brilliantly lighted restaurant where he is enjoying at ease his pale ale or punch.

In these matters, we have been copying the ancient

Romans, who knew all the secrets of gastronomy, and who had fishponds and oyster-stews upon which vast sums of money were annually expended. The luxurious Romans preferred those oysters which were brought from the greatest distances, and gave the palm to those from Britain. They had them transplanted from the seas and rivers communicating with the Atlantic. Spawn or spat from our own shores was also carried—in damp sand, it is supposed—to the Roman oyster-stews by the slaves of the more wealthy, and there nursed and coddled till it became individualised into fine, plump, well-flavoured specimens of the province mollusca. Even now, we have relics left of these achievements in Roman pisciculture; among which are the artificial oyster-banks on the Lake of Fusaro, near Naples, already referred to. These were organised by Sergius Orata, a wealthy Roman, who inhabited a splendid villa near the place. He erected artificial rocks, and had also stakes driven into the water, to which the oyster-fry adhered in countless quantities; in fact, some holding-on place must be erected in the beds, otherwise the progeny would be washed away by the tide. In the green oysters of Marennes, we have another instance of shell-fish cultivation. We are indebted to a communication from M. Corte, of the College of France, for the following notes on the oyster-beds of the river Gironde: 'The reservoirs in which the fishermen of Marennes deposit the oysters, in order to make them turn green, are called *claires*. These differ from ponds and ordinary parks, inasmuch as they are not submerged by every tide, but only during the spring-tides, when the waves flow further inland than at other seasons. At the end of two or three months, the soil, which has been deposited by the inundations in the *claires*, becomes so firm as to prevent the oysters from sinking into it. In the month of September, when the spawning-season is over, the fishing commences. The whole population of Marennes are engaged in collecting the oysters, which they deposit in the ponds, where they increase in size before they are sold. They can be sent to any distance, but from time to time must be immersed in water. Five millions of oysters are annually furnished from the beds of Marennes. Their price varies from one to six francs per hundred—the average cost per hundred being equal to 2s. 6d. of British money.' These famed oysters are transported to all countries. From Bordeaux they are forwarded to Marseille, and from thence to all parts of the south of Italy, and also to Algiers. They have even been found on this side of the Channel. Long, long ago, when 'the monks of old' flourished in our monasteries, there were countless bushels of these fine foreign oysters devoured. Some years ago, when poking about the ruins of an old abbey, far enough from the sea, we came upon layers of shells, which vouched the fact. They testified to oysters of no common breed, for we recognised in them the outward features of the varieties used in the *cuisine* of Paris. They must have had dainty appetites, and have been well versed in the art of good living, these old monks, who sent so far for their oysters.

Since the introduction of aquariums, the art of dredging has become too well known to require us to say much about it. It is by means of the dredge we fish up our oysters. There are usually three machines of the kind attached to each boat; and at some famed bank, free to all comers—such as the mid-channel bed, which is forty miles long—there may be seen during the oyster-season—if we can be said to have a season, now that oysters can be had even in the r-less months—a fleet of perhaps 200 boats, all busily engaged in the pursuit of this one article of commerce. These open sea-beds are not thought to produce oysters so fine as those cultivated in the farms at the mouth of the Thames. The river may possibly bring down

finer kinds of food than the inhabitants of the large sea-beds can obtain; but, in our opinion, the real salt-water natives are the best, although some people, who pretend to judgment in such matters, give the preference to the cultivated kinds. But to return to the dredging. Of course, on the common ground, there are no particular laws to be observed as to the filling the boats. The plan is, to get what you can as fast as you can, and carry them as quickly as possible to the nearest railway-station for immediate conveyance to the great metropolis. The steam-horse is preferred to the old fishing-smack, because it saves the oyster metage chargeable on all supplies landed from the river at Billingsgate. The regulations on the artificial beds of oysters belonging to private individuals or companies are stringently carried out, and the various properties are marked off by long poles firmly fixed in the different parts of the bed. When the dredges are hauled into the luggers, the contents are thrown into a heap, which is afterwards picked or assorted into 'roughs,' 'commons,' and 'natives,' and those that are under the natural size are again deposited in the particular part of the bed to which they properly belong. Amateurs in sea-ware and in natural history may obtain much enjoyment by taking a spell at oyster-dredging. By doing so, they are certain to become more familiar with the riches of the sea and the common objects of the shore. 'What hauls for naturalists, what collections for aquaria,' says a recent newspaper sketch, 'are brought up at every cast! Long stems of sponges, odoriferous bunches of weeds, old shells frosted with barnacles, and peppered with their broad, flower-headed tubularia, horny fronds of sertulariæ and other bryozoa, the jelly-like spawn of the doria, the twisted cords of the eolia, and occasionally some of the nudibranchiates themselves; "dog-whelks," "whelk tangles," "borers" and "burrs," "five fingers" and "twelve fingers," and dead and living things enough to give a zoologist years of work, if he would only make up his mind to know all about them.'

BABOOISM.

In Great Britain, the term respectability has been explained as something attaching to anybody who drives a gig. In British India, babooism may truly be said to signify any condition not involving manual labour. Baboo is, in fact, equivalent to our 'gentleman,' in the popular sense of the word. Whilst, however, the coolie or ryot applies the term 'baboo' to the Hindoo clerk upon eight rupees a month, the Mussuhman trader would use it only for the overseers and heads of departments with whom he has dealings; the European, again, would apply the term to none below the capitalists or wealthy brokers who conduct the chief business of the principal commercial firms in the presidency towns of India. The signification of the word widens just in proportion as it descends in use, until its recipients may be said to be 'legion.' If, then, we treat this term 'babooism' in the wide sense to which it may be applied, we have before us by far the larger portion of the money-making native community of India, at any rate, so far as merchandise is concerned; the *zemindars*, or landholders, and the *shroffs*, or money-dealers, are distinct classes of money-makers, and must in no way be confounded with the baboos.

Within the limits of Calcutta, Bombay, Patna, Dacca, Cawnpore, Agra, and dozens of other cities of India, there are, or were before the rebellion, hundreds, nay, thousands of this class of men in all their varieties of occupation and degrees of money-making. It may be said with indisputable truth, not only that the class thrive and fatten upon European commerce, but that they owe their origin

nd existence to European merchants. The baboos re perfectly well aware of this fact, and accordingly re well disposed to our rule; besides which, being Hindoos, they hate Mohammedanism, and have no sympathy whatever with the rebellious sepoys. They re quite satisfied that, in the event of Mussulman upremacy in India, the rich Hindoos would be the first victims offered up on the altar of Mohammedan apacity. It is quite true that many of the revolted egiments contain a number of Hindoos; but they re nearly all Brahmins, or high-caste men, who dislike the European contempt for and disregard of caste. We have abolished *suttee*, we have legalised the e-marriage of widows, we have put down infanticide, above all, we are enlightening the people, and so apping the foundations of caste; therefore does the Brahmin hate us with his whole heart, as thoroughly as the Mussulman despises us as 'dogs of Christians.' During the whole of the present rebellion, we may afely say, that wherever the populace of towns have oined the sepoys, it has been only the Mussulmans and Brahmins who have shewn real sympathy with them. Our fugitive countrymen have always been well ared for and protected in low-caste villages; whilst illage Mussulmans and Brahmins have welcomed the unfortunates with the tulwar and the matchlock, the ope or the river.

The monster, Nana Sahib, has been called a baboo n some of our Indian journals. It is altogether an rror: he is or was a zemindar—a landholder and ensioner of our government. The baboo is not a man f war: he hates fighting; and if he does sometimes etain about him a small regiment of armed men, it s only for ostentation, or at most as watchmen at ight. The strife he is fitted for is not in the field, ut in the office, the factory, the warehouse: there has e won many a subtle victory; there has he gathered ll his golden laurels; there, and there only, he finds himself an overmatch for the European.

The wide ranks of babooism are open to all the world; it is a fair field, an open competition. Not he meanest hanger-on of a humble shipping-broker, ot the poorest, well-kicked coolie of a sixth-rate anian, but may aspire, in all confidence, to the wealth nd dignity of the highest of the class. Men have one this in years gone by, are doing it to-day, and ill accomplish it to-morrow.

Baboo Futteyseer Bhangyloil, now one of our most nfluential men of business, a large speculator in up-country produce, and a helper of many a British firm rom their difficulties, commenced life as a bottle-lealer, and purchaser of odds and ends from ships' stewards. If he did not begin his transactions afloat very early in life, he must have made most rapid progress in his varied and shifting career, for he is still by no means an old man, and it is many years since he first began to be looked upon as a man of solid substance. Whatever his age may have been when he commenced his daily and hourly cruises to the shipping in the Hoogly, it is quite certain that the sole crew of his miserable little canoe consisted of himself and a diminutive boy, whose duty it was to steer the craft by means of a broken oar. He himself was at once oarsman, broker, and cashier; and by the aid of a very little indifferent English, he managed to get up 'a trade' with nearly every ship's steward to be found afloat on the Calcutta waters.

Bhangyloil was not long content with purchasing only; he soon tried his hand at a little barter, and in exchange for bottles, clothes, tin cases, &c., &c., gave cheroots, straw-hats, toys, monkeys, birds, fruit—it is hard to say what he did not carry in the capacious, gaudily painted *dinghee*, which now bore his colours and his fortune across the bosom of the muddy Hoogly. A brace of oarsmen now officiated, leaving our enterprising caterer to the undisturbed discharge of the

more complicated and honourable function of marine-dealer. Whether it was that the bottles he carried over the ship's side, in place of being empty, contained some costly liquor; whether the cast-off clothes he purchased were, in reality, but too often the last new lot for which the captain or chief-mate had been measured; whether the cheroots he vended were closely allied to the cabbage-garden, but sold as 'real manillas;' or whether any other astounding and ingenious metamorphosis ever occurred in connection with the many articles he dealt in, it is impossible to know. Certain it is that Bhangyloil's trade thrived with all the ample luxuriance of tropical vegetation; and whatever ugly rumours envious men may scatter abroad in these days of his worldly greatness, it concerns not our purpose to tell.* Let us be content to trace his prosperous career from the patched canoe to the state-barge—from the squalid mud-hut on the confines of the Burra Bazaar, to the princely mansion at Entally.

Our friend became a favourite with all the crews in the river: he had a joke or a queer tale told in queerer English, for every one. He was the essence of good temper, and, sorely as he was sometimes tried, he never lost command of himself. The captains took a liking to him, he was so obliging in so many ways—got them out of so many little difficulties, helped them round so many ugly corners, and was so unwearied in serving them in any way, that they swore by Bhangyloil, and voted him A1 for ninety-nine years at Lloyd's.

After such a careful and kindly preparation of the soil, after such a generous broadcast scattering of the seed, it cannot be matter for wonder that our friend reaped an abundant harvest. From the day when he drove down to the *ghât*, or landing-place, in a carriage drawn by a brace of ponies, and pushed off to the ships in a dinghee propelled by four boatmen, and mounted the ships' sides by the state-ladder, with white gilt-edged turban on his head, and flowing folds of muslin about him, when the captains shook him by the hand, and called him 'baboo,' then his subtle Hindoo heart swelled within him, and he felt that his fortune was as good as made. He became a ship-broker and supplier of stores in a large way. A huge anchor and chain-cable threatened the unwary shins of passers-by at the door of his ample warehouse. If he dealt in bottles, and bartered 'real manillas' for left-off wardrobes, it was by deputy. His daily visits on shipboard were continued, but on more important matters than empty casks and canaries. In no other sense was he changed; he was still the same supple-minded, easy-tempered man—as pleasant with steward, cabin-boy, and cook, as when he pulled himself alongside in his frail canoe in days still well remembered. Did a sailor want a loan of ten rupees, or the skipper one of ten thousand, no one could have been more obliging in the matter than our baboo. How he obtained such a command of ready cash, for all occasions, is to this day a matter of deepest mystery. Whether he raised a succession of mortgages on the huge anchor and cable at his door; whether he drew bills at long dates on Vishnu and Brahma, and discounted them at the nearest temple; or whether he possessed a substantial sleeping-partner, who was able to stand so many pulls upon his purse, who can say? Money, however, as the saying has it, makes money, and with Bhangyloil it fructified amazingly; so much so, that in due time he took a country-house, drove a pair of horses, gave up provisioning together with the big anchor and the cable, in favour of a nephew, had an imposing-looking office and *godowns*, or warehouses, with a cotton *screw*, and went headlong into the produce-trade of the country. How many British and American ships he loads annually, I know not, but they must be counted by dozens. How many writers, sircars, cashiers, brokers,

agents, assistants, he may maintain, I doubt whether he knows himself. Not a soul of all that motley throng touched one single piece of salary from the baboo: some were there as volunteers, learners of the mysterious art of Indian trade, while others, well versed in the sinuities of Calcutta commerce and banking, made large monthly sums by fees, or commissions, or profits upon their master's transactions. The income of all was derived, in an indirect manner, from the baboo's customers and friends, not from himself, or rarely so: a practice which has existed for a century, and is a recognised form of payment for services. It is in vain any reformer attempts to break through the system; the *amiah*, as the establishment is called, is able to break down any opposition to its will and pleasure. Woo beside the unfortunate merchant who would dare make such an experiment! He would find his imported goods unsaleable; they would be landed damaged: he would be able to buy no produce without great sacrifices, and then only of the lowest quality: his chartered ships would be detained long after their appointed time, and to his great loss, with the addition of a vast quantity of the goods shipped getting damaged in a most unaccountable way. Such is a taste of the power of the baboo's *amiah*. Keep on good terms with them; don't look too scrutinisingly into their accounts; let them pocket the accustomed ruyees without question, and you'll find your business, multifarious as it may be, transacted rapidly, pleasantly, and, above all, profitably.

It is now some years since Baboo Bhangyell became one of the leading men of the native community of Calcutta, and since he bought the pleasure-grounds at Eotally, and built upon them the magnificent dwelling within whose brilliant walls he entertains the elite of European society. It would be difficult to desire anything to gratify and please that may not be found in the baboo's palace. It would not be easy to match his carriage and pair in Bengal. Very few even in that sumptuous land excel his public manifestations; perhaps still fewer of any standing fare, in private, more humbly than himself. Amidst all his prosperity, he has lost none of his good temper and humour: he is as unctuous as of yore amongst the Jacks about, and none leave his presence without feeling the genial warmth of his disposition. Exactness to the last fraction in all his business transactions, he is never selfish; and many are the deeds of generous kindness springing secretly from him, unknown to the world at large. One especial case came under my own knowledge: it was that of a young and deserving English merchant, who had become involved in ruinous difficulties from the defalcations of others, and who was contemplating bankruptcy; when the baboo quietly, unasked, and unknown to the merchant, paid to his credit at his banker's a lac of ruyees, with a desire that the bank might afford accommodation to double that amount in addition. This timely, generous assistance extricated the young man from embarrassment, and enabled him to regain his lost position; but to the present day, I believe he remains in perfect ignorance of his benefactor's name.

Possessed of far more wealth, though scarcely of more influence, we find the Mussulman banker, Ram Chunder Sing of Cosittollah, Calcutta, and Chitpore Road. The huge fortunes that have been amassed by many of the natives of Bengal might well astound most of my European readers. The fact, however, goes far to shew that the celebrated 'Pagoda Tree,' from whose rich branches so many of our countrymen, in days gone by, gathered their *crores* untold, still flourishes in the land, though, doubtless, not quite so easily approached as half a century since. To the native of the soil, however, it is my firm belief, the generous tree is still familiar as of yore. Time, which works so many wondrous changes in this shifting

world of ours, has left the Hindoo what he ever was. As subtle, as yielding to circumstances, as true to his ultimate object, he knows no change in nature. What he is physically in the body, he remains essentially in intellect—inferior in force and vigour to the European, but superior, how much superior, to him in ductility, in pliability, in adaptability! What he was when Clive conquered at Plassey, and laid the foundation-stone of British supremacy in the east, before the light of western intelligence dawned with its first faint streaks upon Indian myriads, such is he to-day, when the British standard and British influence reach to the most remote corner of the great Indian continent.

Scarcely less remarkable than the instance already related, is the career of this Bengalee Mussulman banker. From beginnings almost as obscure and quite as humble, Ram Chunder Sing has, within the memory of many of the present residents in Calcutta, managed to amass such a princely fortune as might well raise the envy of a Baring or a Laftie. He commenced public life when quite young, as a hanger-on at the salt *colahs*, performing any miscellaneous work that might be required, and by his activity, willingness, and intelligence, he rapidly ingratiated himself into the good-will of those who might best serve his interests. Promoted to a post of five ruyees a month, he worked at it as though in the receipt of fifty. Perhaps, indeed, the actual incomings of his office may not have amounted to much less than that sum; for it is remarkable how many substantial civilities are shewn to any one concerned in the measuring and delivery of salt from the government *colahs* or stores. But Ram Chunder was slightly ambitious: his occupation was not sufficiently stirring and expansive for his enlarged views, and he left no description of stone unturned in order to obtain promotion to the sale-office of the salt department. It was by no means an easy task: an extensive amount of 'palm-oil' had to be applied in the right quarter before the attempt succeeded; when it did, Ram Chunder's friends considered his fortune as good as made, and congratulated him accordingly. To a western mind, it will probably appear somewhat inexplicable that the appointment to a subordinate office in any government department in Bengal should be of such vast benefit as is made to appear in this paper; but those who have enjoyed the advantages of actual experience in Indian official life, especially of life in the salt department, know full well how full of significance are the congratulations of a newly appointed official's friends.

Now, then, O reader in the west, that within the limits of the Company's rule, no sale, or barter, or business of any kind takes place but leaves a handsome profit to all the native underlings who help the work along. In no department of the state is this more manifest than in the salt branch of the revenue. Vast quantities are offered by the government at monthly intervals for 'sale by public competition'—so runs the official notice, and such, doubtless, was the original intention of the executive. But Bengal officials have devised a far more convenient process than an ordinary public auction, which would be noisy, and hot, and disagreeable, though the government opium is so disposed of; but then salt is not opium. Accordingly, this necessary of life is allowed to be tendered for in certain quantities at a certain figure, the application to go in on stamped papers on the day of sale. Now, as there are large profits made on the re-sale of this salt, the anxiety to obtain an allotment of it—say for a hundred thousand maunds—is not trifling, and the underlings of the department turn the excitement to the best account. As it is pretty well known that the highest offers are not generally accepted, and as there are strange rumours afloat in

Calcutta as to the precise motives which guide the allotting of the salt, of course all use their best endeavours to propitiate those who are suspected of possessing any influence in the matter. It was a favourite dodge of Ram Chunder Sing to waylay the chief superintendent of the department on his way into the office, and, trotting along by his side, hold some trivial conversation with him with an air of intense importance. This was not lost upon the crowd in the court-yard waiting to make their contracts, who one and all set him down as deep in the confidence of his superior. It is scarcely necessary to say how Ram Chunder turned this to account.

It was not long before he turned salt-speculator himself in conjunction with friends, who from that time became the most successful bidders at the monthly sales. No one could say how it happened—whether it was the colour of the paper, the boldness of the writing, the respectability of the names, or merely their good-fortune that caused such huge quantities of salt to pass through their hands, and leave such auriferous deposits behind. Ram left the salt department and the salt trade to carry on financial schemes of a larger character. He lived in great style as a rich banker, lent money at unheard-of rates, and was a most obliging friend to Bengal civilians. He had a strange relish for this description of game: he delighted to see their names in his books; so much so, that he would not think of troubling them for the trifles they owed—he was only too proud to be of any service to them. Now, it was a curious circumstance, and one which was duly noticed, that in the many suits instituted or defended by Ram Chunder in the courts of the Company, he invariably gained his point. Was there a contract to be tendered for to supply the Company's commissariat with anchors or scrubbing-brushes, with rum or salt-beef, Ram Chunder proved the successful man.

A volume, and a goodly one too, might be filled with the monetary exploits of the wealthy shroff. There was scarcely a public office he did not manage to obtain a place in for some one of his many creatures. Judges, secretaries, collectors, magistrates, all courted the friendship of the powerful baboo, who could serve them in such a persuasive and pleasant manner. His society, too, was sought for. He entertained, and was entertained in return. Europeans were his especial boon-companions, for whom he could not do too much. When the recent rebellion broke out, Ram Chunder denounced the traitors in emphatic language, and placed himself and all his means at the disposal of government. He loved our rule, our laws, our customs, our society far too much to desire any change. He was all but an Englishman—a most loyal man. It is true he had large sums invested in Company's paper, larger still in house-property about Calcutta, and large contracts in hand for our commissariat, with others in prospective. Still he was a loyal man. This points to the distinction of baboos, even when all these good things are as yet in *nubibus*. This points to the connection between babooism and respectability.

'CHURCH AFFAIRS AT BALLYGARRIFFE.'

The article that appeared with this title in No. 203, we printed merely as an amusing fiction; but it now appears that there is really a village, though with another name, answering to the description of Ballygarraffe, and that the writer, in order, no doubt, to give piquancy to the joke, intermingled personal allusions with the fictitious details, under excitement and without due consideration. We need not say how much we regret having been made the medium of hurting the feelings of respectable persons; but we may point to the character of our Journal, maintained uniformly from the commencement, as evidence that it was so without the slightest consciousness on our part.

LAST THOUGHTS.

HAVE they told thee I am dying?
Careless world, careless world—
Have thy proud lips scarce replying
The dirge-notes backward hurled,
Saying, with a scornful smile:
'She was fair a little while—
Courtied! but she had her day;
There's no need that she should stay.
I have nought for her to do,
Amid all my glittering crew:
'Tis well that she is dying!'

Have they told ye I am dying?
Summer friends, summer friends,
Have ye made pretence at sighing
O'er the weary life that ends;
Have ye said with feigned sorrow:
'May she have a brighter morrow.
She has not joined us long
In mirth, or dance, or song.
Her bloom is on the wane;
Her eyes are dimmed with pain:
'Tis well that she is dying!'

Have they told thee I am dying?
Gentle friend, gentle friend,
Will thy sweet spirit sighing
One tender message send;
Dost say with tearful eye
Raised to the quiet sky:
'God slake the fever-thirst
Her earthly dreams have nursed,
And bathe that aching brow
Where living waters flow:
God help her!—she is dying.'

Have they told thee I am dying?
Heart estranged, heart estranged!
And dost thou turn in sighing
To old times long since changed;
Dost say with flushing cheek:
'She was young, and very weak.
Though it wrung my heart to leave her—
Though she wronged me, I forgive her.
Many deathless memories
Paint her with such gentle eyes,
My lost love who is dying.'

Have they told thee I am dying?
Mother blest, mother blest!
Have they told thee I am dying?
With weary heart and breast,
Dost say to angels round:
'The child I lost is found.
I've left her, ah! too long,
'Mid earthly harm and wrong.
There is no place for her
'Mid all life's busy stir;
We'll give her welcome here,
So far from grief and fear:
'Tis well that she is dying!'

STAGE BURLESQUES.

Burlesques, of which it is the formal purpose to convert into laughter what was meant to exalt and purify the soul, are offences against the public taste and morals equally; and that such offences, instead of being promptly silenced, should be applauded and caressed, and that Shakspeare should be especially selected as the butt of these barren wittlings, appears to us one of the most decisive symptoms that the drama, in our generation, is really on the decline.—*Donne's Essays on the Drama.*

PRICE 1½d.

THE CREDIT-SYSTEM.

IN relation to one of the monster bankruptcies of the last few months—that of a house [*'castle of cards'* were a better term] engaged in the production of a class of female finery, and which leaves the world some hundreds of thousands of pounds *minus*—it is notorious that the house, during its existence, was an utter pest to all other people engaged in the same business, by reason of its practice of underselling. The case is an apt illustration of the beauties of the credit-system. The trade was conducted mainly on the credit and at the risk of a set of innocent, unthinking people, constituting what was called the Western Bank—spread desolation around among its compeers, who traded on their own risk—and now the bank shareholders have to make good, in solid cash, to their own impoverishment, the ideal capital which enabled a company of rash men to speculate for a small chance in their own favour against a certainty of loss to others. There is nothing in the case beyond the most familiar facts in human life. When a man works upon money of his own, he proceeds with caution, and the best exercise of judgment that is in his power. Give him other people's money to do as he likes with, and he makes it spin. It is not therefore surprising that three or four hundred thousand pounds of a bank's money, intrusted to an adventurer, should, in the first place, do a good deal of harm in the spending, and finally be lost.

The case leads to a view of the whole credit-system, which it were well to daguerreotype on the public mind. Carried to such extremes as we have seen lately, it promotes wasteful, mischievous, and unsuccessful business, and suffers a fearful penalty in itself. There is, however, another view of it.

There is such a thing as a tolerably good business conducted mainly on the basis of credit, though likewise with injurious results. We can state a case by way of illustration. An ingenious and accomplished man was in business as a publisher. He planned and superintended the preparation of many excellent books. But his speculations were too great for his means. He had consequently to buy paper from wholesale stationers at perhaps twenty per cent. above ready-money prices. He had to give large percentages to bill-discounters. He had to take in partners, who, for the sake of small advances, drew a large share of profits. All the natural and proper fruits of many years of laborious industry were thus absorbed, and large losses incurred besides, and this really able and ingenious man ended as poor as he began. It is strictly a normal case. Where banks

or other capitalists advance money expressly to carry on a business, they are not without a view to their own interests. They see to get good advantages from their loans, and usually succeed in licking up the cream of any concern they are connected with. It is only when they inflate the wind-bag too much, that they suffer as the Western Bank shareholders now do. 'Twas a riskful trade, giving large returns so far as successful, but involving great risks also—so, when the business was carried to excess, *nine per cent. on shares* was suddenly exchanged for *loss of whole capital and a third more*.

The credit-system involves, then, an usurious element besides. We have come of late years to give legal sanction to what in former times was regarded as a kind of robbery. It now appears right that men should be allowed to take as much interest for their money as lenders are willing to give, it being assumed that a lender will only give what it is for his own good to give. Yet there is a natural sentiment against usury—it always looks like oppression. And, surely if any one makes a richly gainful trade to himself by holding out temptations to the illusory hopes of poor men, thriving upon the very necessities into which his fellow-creatures have fallen, ultimately in most cases making his mickle more at the expense of the little which poverty possesses—the natural sentiment, the sentiment on which former laws against usury were based, is justified. We may at least be entitled to say: It is a bad business for poor Lazarus, and it were to be wished that he would not thus put himself in Dives's power. It is, at the utmost, one of those things which the law finds it convenient to leave alone, but which are nevertheless condemned by the natural sense of what is just between man and man.

It appears, then, that business on the credit-system is, in the most favourable circumstances, injurious to the borrowing party, and, in the less favourable circumstances, ruinous to the lending party or the extender of credit. In the measure of the extent to which it is carried, business will become a hollow, deceptive, unsatisfactory affair; artificial difficulties will be found obstructing the industrious man working on realised means; agonising competitions, leading to adulterations and all other kinds of safe tricks and cheats, will arise; only a few, unusually dexterous or fortunate, or who are in possession of special advantages for conducting a lucrative business, will find themselves thriving. In short, the unavoidable result of such a system will be exactly that condition of things which we see in the commercial world—so full of disappointment and vexation to all well-meaning and pure-hearted men—and we may therefore well

believe that to the credit-system, in a great degree, this very condition of things is owing.

We are able to present the case of a firm which for many years acted, in a kindred business, on the opposite principle to that pursued by the publisher above alluded to. It from the beginning proceeded on the ready-money principle. The results of one adventure were made the basis on which another was built. No adventure was entered upon without a previous ascertainment of there being ample means of carrying it out, whether it should be a success or a failure. The principal materials employed were settled for in cash every month. Not a single bill was ever accepted by the firm, and it scarcely ever discounted any that were receivable. There consequently was no anxiety about the conducting of the business. Extra time and energy, which other men of business spend in *financiering*—a kind of occupation wholly unprofitable—were devoted by the members of this firm to the studies and accomplishments calculated to raise men in the esteem of their fellow-creatures. The business moved slowly on at first, but it never misgave or relapsed, notwithstanding both troubles and losses from consignees who unhappily acted on a different principle; and after a considerable series of years it attained great magnitude, while yet resting on perfectly solid foundations. Here, in short, was an example of a rational career in commerce—no straining, no making of needless difficulties, no waste of time on work leading to nothing, rewards reaped by the workers, instead of being abstracted by horse-leech sleeping-partners and bill-discounters, a rationally enjoyable and even dignified life attained, instead of one of incessant degrading care and worry ending in disappointment—and all through one simple principle—that of *working on one's own, instead of another's capital*. What a contrast! When we duly consider such a case as an example of what commercial life may be made when right principles are followed, what can we do but wonder at once at the simplicity of the right course, and the perseverance of so large a portion of the community in the wrong one?

To realise such a course as this, however, there must be—as there was in the firm in question—patience with the slender means and the narrow profits at first. The besetting sin of commercial men is over-eagerness—excessive haste to be rich. It is indeed a striking feature of the commercial mind, both in this country and in America, that, instead of a just and honest pride in business as the worthy occupation of a life, there appears a restless desire to be quit of it. Men are seen striving to effect a competency by one lucky stroke, or by a few years of brilliant practice—anything to *escape* from business, as if it were either a thing ordinarily calling for an intolerable self-sacrifice or a path of perils in which there could be no peace. Now there are some who are impelled in these demonstrations by ambition for fine living or the éclat of wealth; but we as often see great gambling speculators living very plainly, and evidently incapable of filling a station of wealth and dignity, or of enjoying it. The more prevalent cause of the over-eagerness is an uneasy sense of the risks, harassments, and disappointments attending a commercial career—the evils, in fact, which spring from this very credit-system. The merchant pines under the terrors of his distant ventures, from which the returns may be nil; the shopkeeper, finding himself pinched by the foolish competition raised around him through credit, longs to be in any safe haven and at rest. These are the true general causes of the over-eagerness for great successes, as contrasted with moderate returns from sober diligence and application. It comes all back to this wicked credit-system—this sluice of continual drainage from the good labour going on in the world. If men would enter upon business in calmness and patience, keeping clear

of credit, realising to themselves that work is the only real source of wealth, and that the saved products of one piece of work are the only true foundation for another and another; if, while so acting, they would be content to live frugally till the easy overplus of realised means enables them to take those indulgences which are their proper and fitting reward; one half of the proverbial cares of the world would be spared, merchandise would be entered on as a path of pleasantness, and the merchant would, generally speaking, be a far more honour-worthy being than he is.

Let us hope to see, for the future, a great restriction put upon the credit-system. There has just been a palpable loss to the British community of fifty millions by the bankruptcies of one crisis, the proper close of a course in which trade has been degraded to a gambling speculation, and infinite troubles and difficulties have been spread throughout the industrial world. We must see to arrange that no such thing can happen again to the same extent. As individuals, let us try to clear our minds of monetary fallacies, such as that of enlarged and unrestricted issues of paper-money, the equal importance of having credit as having money, the wastefulness of keeping gold in the coffers of the Bank of England, and so forth. And let us each try to keep our own transactions reasonably near the limit of our realised capital. Let us resist the Siren Credit when she holds out her allurements. Neither let us be too easily led by sympathy for young and rising traders, to help them to a degree of 'accommodation' likely to prove their bane.

There must—for the restoration of a right system of things—be a change in the popular conceptions, and the constitutional arrangements, as to banks. The legitimate business of these establishments is to act as a medium in payments, and give a merely temporary accommodation of credit on the basis of actual goods and real transactions. Money-lending for trading speculations, while it may be a profitable iniquity to individual bill-discounters who know their ground, can never be safely practised by a large joint-stock company under the charge of a manager and directors. Everything of the kind is to be utterly condemned.

A TREMENDOUS ASCENT.

My name is Robinson; and I think I must be somehow connected with that well-known traveller who, in conjunction with his two friends, Brown and Jones, made the celebrated foreign tour which Mr Doyle so kindly illustrated for them. I think so, because, besides the coincidence of name, I have the like passionate love of adventure, tempered with the same peculiar appreciation of comfort, as he; and although circumstances, over which I have no control, and about which it would be an impertinence in the public to inquire, have restricted my rambles to my native country, my experiences, like his, may not be altogether uninteresting.

If there is something attractive in the mere appearance of a person who has been up Mont Blanc—disappointing as it is, we must confess, not to find him taller than other people—there must be an interest, although perhaps in a lesser degree, attaching to one who has scaled Helvellyn. If, upon the topmost peak of Cotopaxi, it astonished the philosophic traveller to discover 'butterflies and other insects, which must,' he supposes, 'have been conveyed there by unusual currents of air;' and if the whole scientific world were similarly wonder-struck to hear it, it must surely awaken some surprise when the statement is made public that I too have observed the same phenomenon on the summit of Skiddaw, although I may not have attributed it to so abstruse a cause. These things, it may be urged, however, are solely matters of

comparison; and for the sake of argument, suppose this to be admitted. Let Humboldt upon his pinnacle, let Smith upon his glacier, be by all means duly honoured; but refuse not to Robinson, upon his British mountain-top, a humbler meed of approbation too. But, indeed, this is but a low view to take on such a matter after all. When the mathematician, with his reading-party in North Wales, apologised for not climbing Snowdon, upon the ground that there was a hill behind his residence quite high enough for all practical purposes, he enunciated a mighty truth. I am not, indeed, a mathematician, but I appreciate his remark in all its depth and fullness. Helvellyn and Skiddaw are quite sufficient for all my humble needs; Mont Blanc and Cotopaxi would be very considerably too high. Is it pretended that the sensations of a poor fellow, climbing a steep place in Westmoreland, are different from those of another poor fellow going through the same sort of thing in Switzerland? Did Mr Albert Smith, think you, approaching the *Grands Mulets*, perspire more freely than I did in my ascent of Griesdale Pass, before I met the donkey? I was fourteen stone when I began that expedition from Gramere, and I was twelve stone and a half when I was brought down thither, that same evening, upon the back of that friendly animal. Such a fact as this needs no comment. Was the Alpine excursionist blistered with much walking? I also can procure the testimony—in writing, if it be necessary—of my two sons, as to the awful condition of their father's feet. Was he drowsy, and did he, towards the conclusion of his labours, tumble upon this side and upon that, like a drunken man? Ask my guide, Gawain Mackareth of Town End, if he did not, upon the occasion to which I refer, pick me up four distinct times; besides pouring upon me a continual fire of 'Now then, sirs,' and 'Hold up, sirs,' for the last two miles! No human being, not excepting Mr Smith, could possibly have endured more or worse things in his experience than I in mine. I claim, therefore, to be heard. Again, can it in any way increase the risk to a person of my habit of body, or indeed to any person, if, in case of a false step, he has to fall a sheer seven thousand feet perpendicular, instead of seven hundred? And as to the magnificence of the prospect at a great elevation, am I to be told that the power of vision is always proportionably extended to suit it? I saw all I was able to see from the height I am about to refer to; and there was still a great deal more beyond, could I have availed myself of nature's superabundant offer. Had there been twenty times that extra prospect extended for my gaze, what benefit would that have been to me? I suffered all I could, I saw all I could, and I got to the very top of my mountain. What conditions of ascent then, I demand to know, have remained unfulfilled? Relying, therefore, upon the great success at Egyptian Hall, I appeal to the everlasting principles of justice, and to that love of fair-play which is said to actuate the British heart, in requesting of the general public a wide circulation and a considerable popularity for the following particulars of my tremendous ascent—of Fairfield.

It is not my intention to emulate the majority of my predecessors who have published memorials of this sort, in giving a detailed history of my birth and education, and especially of the social position of the Robinson family in bygone times, but I will begin at once with the circumstances of the adventure itself. A few summers since, I was staying with three friends, whose modesty demands their still remaining unknown characters as X, Y, Z, at Ambleside in the heart of the lake-country. We four had come from Manchester to 'do' the mountain district, and had done it thoroughly. X had killed a pony (which very nearly killed him first) upon Scafell; Y had been almost drowned in Windermere through attempting to swim

with corks on, and letting go the corks; Z, who was a naturalist, but did not know much about mountaineering, had been benighted on Wausfell from the unforeseen circumstance of the sun leaving the hill-top before it left the sides. He had found, early in his ramble, a very rare and curious beetle, which he had wrapped up carefully in his waistcoat-pocket; but while roaming about in the darkness, hunger had overpowered love of science; and after much hesitation, he had devoured the specimen. Having got down to Ambleside at last, however, he declared this to have been the sublimest adventure possible, and proposed our spending a night together upon the summit of some other steep, a suggestion which we unanimously applauded; only I insisted that the thing should be done comfortably. 'None of your rare and curious beetles for supper for me,' said I; 'none of your rocky pillows, and slumbers under the canopy of heaven: Joseph Robinson goes up like a gentleman,' I gave them distinctly to understand, 'or he doesn't go up at all.' It was therefore arranged that I should have the sole charge of the commissariat. As for the mountain, we determined at once that that should be Fairfield. It is about 3000 feet above the level of the sea; and we proposed to sleep upon the summit of its huge green back. The news spread like wild-fire through the little village; offers of service poured in from every quarter—guides, lanterns (even a boat from one person, who thought it would be a very snug affair turned upside down), ponies, mules—camels would, I doubt not, have been forthcoming, had we desired them—everything we wanted, and many things of which we had no need, were pressed upon us eagerly. We had already an alpenstock apiece (which, for my own part, since it is for ever getting between my legs and tripping me up, I do not consider an assistance), and a railway rug; and the landlord of our hotel provided the provisions. These were the chief of the necessities which my sagacity procured for our night-bivouac and tremendous ascent: fourteen bottles of bitter beer, two bottles of gin, two bottles of sherry, one gallon of water, four loaves of bread, one leg of lamb, one leg of mutton, two fowls, one tongue, half-pound of cigars, four carriage-lamps, and two packs of playing-cards. We had also a large tent, which was carried upon the back of a horse. Three men were necessary to pitch this tabernacle and to carry the provisions. About five o'clock in the afternoon we started for the mountain with a large train of admirers, forming the largest cavalcade that had ever left Ambleside before. But most of our camp-followers quitted us at the foot of Naps Scar, at Rydal, where the tremendous ascent was to begin.

For the first quarter of an hour our way lay amongst trees and green fields, but after that, vegetation began to grow scanty, and soon even the hardy fir-trees disappeared; however, it was very well to have dispensed with the stone-walls, which have a habit in this region of leaning over upon the side which you wish to climb, and of falling bodily upon you as soon as you cling hold of their topmost layer. It is easier to squeeze through the holes made beneath them for the sheep; and very good fun, after one is safe, to watch an elongated body, such as Y, come creeping behind, half in one field and half in another, and casting a not uninterested eye above him, to see whether the wall is about to cut him in two or not. A few sheep are still sprinkled about our path, but the cows are left far beneath. A rook or two from Rydal woods flaps by us, but these will soon cease, to be exchanged for the sliding buzzard, with his huge brown wings, whose plaintive cry is even now piercing our ears from the upper heights.

Otherwise, there is no sound, except the laborious puffing of your humble servant and his three companions, and that abominable 'tramp, tramp' of the

porters, which never tires, and which leaves us so hopelessly behind. At every step, some novel beauty opens upon us, if we had but time to look at it; but as soon as X or Y calls our attention to the same, and our backs are turned, they make use of that infamous advantage to get on forty yards in advance; so Z and I only look straight before us, and wait patiently for the panorama which we know we shall get at the top. Presently, we spy a fresh green mound of the softest turf, and X cannot resist the temptation to rest his tired limbs. No sooner has he seated himself, when up go his legs and arms into the air, and down goes that portion of his person which gravity attracts into the treacherous bog. He is doubled up into the form of a V, and presents a ridiculous appearance; and when he is taken out and straightened, wet through, and brown and green, he is a not less laughable spectacle. If we had been bound together with ropes, as persons ought always to be, it seems, on these tremendous excursions, this accident could not have occurred.

The tourist who has only climbed such hills as Loughrigg and Helm Crag can have no conception of the terrors of the heights at which we had now arrived. The frightful rock-rent chasms on all sides of us; the scarcely less dangerous grassy slopes, upon which, had I set my foot, I am morally convinced I should have rolled over and over like a football to the very bottom of the valley; the hideous shapes of the crags themselves, and the awful barren tracts that lay before us still to be crossed, whose northern sides were sheer tremendous precipices. We felt, however, the greatest confidence in our attendants, who—such is the power of habit in familiarising men to the most perilous situations—were whistling popular melodies throughout the journey; and perceiving the horse in particular to take the matter with great coolness and philosophy, X, Y, Z, and myself were not slow, in the more difficult places, to adopt his fashion of proceeding upon all fours. At last we reached the topmost of the humps or *aiguilles* of Fairfield, a little beyond which we had determined to fix our tent. Here we caught the sound of a fowling-piece fired off at Ambleside, no doubt in exultation at our success; and X acknowledged the compliment by tying his pocket-handkerchief on to his umbrella, and waving it three times.

While the guides were employed in arrangements for our comfort and refreshment, we walked to the very topmost plane of the mountain, and gave ourselves up unrestrainedly to the enjoyment of the poetry of our position. One of the porters, a very trusty man of the name of White, had been up twice before, and averred he had never seen such weather as we were now favoured with—a circumstance which occurs, however, rather often in tremendous ascents. Far, far away beneath us lay the yet sparkling sea, and the rounded outline of the Isle of Man to westward. We could see the broad yellow fringe of Morecambe Bay, and, as Z declared, even a band of travellers crossing the sands of Lancaster; but I confess there was to me a somewhat filmy and indistinct appearance about these pilgrims. In the nearer circle lay fair Windermere, studded with many a glistening sail, and Conistone with its fine old guardian hill standing out grandly—a couch for the setting sun: Grasmere, too, and Easedale Tarn lying peacefully in its lone and lofty bed; and all these amidst a meshwork of gigantic mountains, of which Scafell—the highest in England—Bowfell, and Skiddaw, were the chief. Close beside us, to northward, was Helvellyn, with its looking-glass, Grisedale Tarn; and to the east of them lay Ullawater and the great Kirkstone range; while wood-besprinkled, peaceful Rydal filled up the foreground at our feet. Presently, their bright hues faded away from the lakes and lower fells, and the purple tints upon the western mountain-tops began to herald evening. The wind, too, was rising, and soon

swept over the lofty and exposed ridge on which we stood with the chill of night, before we turned towards our shelter.

How beautiful our tent looked through the gloom, shining as it did—for the four carriage-lamps were lit within it—over the whole sleeping world like some fair star! The wind, however, had not permitted it to be expanded to its full dimensions; and though one of the porters had gone down with our animal home, there were still six persons to be accommodated under canvas, and there was little room to spare. Even in that bleak position, and with a north-easter rising, we were a great deal too hot inside, and we had to keep a fold open as a ventilator. We ate our supper with such appetites as only mountain-air engenders; and afterwards, having kindled a fire outside, we got some warm water to mix with our gin, lit our cigars, and made ourselves comfortable: I am afraid, also, that we indulged, in that mountain solitude, in a few rubbers at whist. It was pleasant, Z had just discovered, to be thus enjoying all the advantages of civilisation in such a spot, while the wind was howling so vainly around our snug dwelling. We had all agreed to this observation; I had dealt, and was about turning up the trumps, which, I grieve to say—since we did not play the game out—was an ace, when a frightful occurrence happened. In an instant, something hurled me from my kneeling posture prostrate upon the ground, and some monster at the same moment seemed to leap upon me with inconceivable force. The whole of the party experienced a sensation precisely similar. The last storm-puff had carried our tent clean off its pegs.

For some minutes we were inextricably involved amidst guides, bottles, friends, cards, carriage-lamps, and cold meats, besides finding a great difficulty in breathing. I struggled as violently as any, I do not doubt, and was the first to find myself about ankle-deep in the coldest water. The whole concern had rolled somehow into a morass, and it was matter of great good-fortune that it did so, instead of rolling into the fire which had been kindled immediately below it. When I had extricated myself, the other five were still struggling like eels in a net, and quarrelling among themselves for kicking one another. I rescued a lamp which was still burning, and then drew out poor Y by his left leg; he had fallen unluckily upon one of the other lamps, and had been a long time, poor fellow, putting it out with the small of his back. X had fallen face downwards into the morass, and was now got to be the same colour all over with which he had partially bedaubed himself in the moss-bog. Z, who thought we had been struck with a thunderbolt, was speechless with terror; even the guides were very doubtful whether tent and all had really rolled down the precipice or not.

It was about one o'clock in the morning; there was no moon; and oh, how bitterly blew that mountain wind! What did Z mean, we demanded, by bringing us up into such a place as that, to suffer such things as these? If it had not been for him, we should have been all of us snug asleep in our civilised beds by this time. Hark at that abominable canvas, cracking and straining, while the porters strive to set Humpty Dumpty up again! We never were more miserable in all our lives; but I am thankful to say Z was the most miserable. When, after an hour or so, things had been restored to their proper places, he dared not venture into the tent again, but patrolled it like a sentry for the remainder of the night, not daring to leave it, or to descend, for fear of losing his way upon the fell. Then, in the cold gray morning, a mist came over Fairfield, which presently began to drizzle, and then to rain. Instead of that fine panorama which we had so counted upon, we could not see above five yards in any direction; a slight inflammation in the eastern

sky was all that betokened sunrise. More limp, discreditable-looking persons than X, Y, Z, and myself, when we came down from Fairfield, can scarcely be imagined. We did not thoroughly appreciate our miserable condition until somebody at Rydal offered to lend us umbrellas! He might as well have offered Macintoshes to a family of otters!

Most of this I take from my notes written immediately after this celebrated feat, so that they are strictly reliable; but I have often heard my three friends, and have even caught myself, representing this our night on Fairfield as the most glorious in all our lives, 'passed in close communion,' as it was, 'with nature in her grandest aspect, and with no trace of the living world in sight to mar the solemn emotions of the soul;' the moonlight 'lying cold and silvery on the mountain-tops;' the march of the red sunrise 'driving before it the clouds of night along the eastern hills.' So different, to even the most accurate of men, are the realities of a tremendous ascent from its reminiscences.

SHAKSPEARE'S BEAUTIES.

ANOTHER illustrated Shakespeare?

A certain Leadenhall Street clerk, who appreciated our elder dramatists, and did not despise roast-pig, in one of his delightful letters exclaims: 'What injury did not Boydell's Shakespeare Gallery do me with Shakespeare? To have Opie's Shakespeare, Northcote's Shakespeare, light-headed Fuseli's Shakespeare, heavy-headed Romney's Shakespeare, wooden-headed West's Shakespeare, deaf-headed Reynolds's Shakespeare, instead of my and everybody's Shakespeare! to be tied down to an authentic face of Juliet! to have Imogen's portrait! to confine the illimitable!'

We must endorse Elia's indignant remonstrance, treason though it be considered now, when every week brings forth some old familiar friend, so bedizened in the dandyism of tinted leaves, elegant engravings, and crimson and gold covers, that we are afraid to touch him lest we soil his finery. We cannot relish our favourite authors turned into 'pretty books.'

What true reader of Shakespeare would exchange his own ideal Rosalinds and Beatrices, Titanias and Ariels, for those of the best artist that ever wielded brush or burin? Some paintings once seen are never forgotten; they impress themselves as indelibly on the memory as reality itself. Can any of us thus recollect a Shakspearian picture? Why, a conclave of all who write, and all who hope to write R.A. after their names, would fail to do justice to the prince of dramatists, and yet more than one artist has had the hardihood to attempt to illustrate the whole of his plays; the presumption to suppose he could throw off in a couple of years or so, some hundred or more designs worthy to be printed with Shakespeare's text! Give us Shakespeare undefiled, free from irritating initials interrupting his dialogue, free from nonsensical notes obscuring his meaning, and, above all, free from presumptuous engravings, marring his men, and libelling his women. It is a sacrilege to have the latter dragged down to a level with the simpering advertisements of our Books of Beauty.

In sweet Will's sweet world, our fancy must be the only limner: he himself has so willed it. While our modern rhymers delight in giving us minute portraits of each fair lady of their song—from head to foot, from top to toe, we have the catalogue of her condition—we shall find Shakespeare very chary of such details.

His lovers are too enraptured to be able to check off each particular excellence of their mistresses with clerkly precision; and we can gather little from other sources respecting the features, form, or complexion of Shakespeare's heroines, to enable us to see them in our mind's eye, as he saw them in his.

Prince Ferdinand extols frank-spoken Miranda as being

Created
Of every creature's best.

The faint-hearted Claudio tells Lucio how Isabella hath

Prosperous art
When she will play with reason and discourse,
And well she can persuade.

Hamlet calls his misused mistress 'the fair Ophelia.' Sebastian declares his sister Viola 'was of many accounted beautiful.' Othello vouches for Desdemona's abilities as a musician and housewife. Perdita is complimented as

The prettiest low-born lass that e'er
Ran on the green-sward.

And all we learn of fair and faithful Juliet is:

On Lammas eve at night shall she be fourteen—

a forward chick indeed!

Lord Byron somewhat curtly declares: 'I hate a dumpy woman!' Shakespeare's taste was more universal. It was Bertram's scorned wife, the physician's daughter, 'Little' Helen, whose

Beauty did astonish the survey
Of richest eyes; whose words all ears took captive;
Whose dear perfection, hearts that scorned to serve
Humbly called mistress.

Our poet was fond of contrasting ladies of high with ladies of low stature, the latter being invariably brunettes. Thus, when Lysander, bewitched by perverse Puck, shakes off the wonder-stricken Hermia with the rude ungallant words:

Out, tawny Tartar!—out!

the poor lady, unable otherwise to account for his fickleness, accuses her unwitting rival, Helena, of having

Made compare
Between our statures, she hath urged her height,
And with her personage, her tall personage,
Her height forsooth! she hath prevailed with him!

Our favourite masquerading heroine, Rosalind, is 'fair, and more than common tall,' thereby suggesting the adoption of doublet and hose by the banished duke's fair daughter, and that of a brother by her 'pretty little coz,' Celia, who is 'low and browner.' The slandered Hero, 'Leonato's short daughter,' is summarily appraised by Benedick as 'too low for a high praise, too brown for a fair praise, and too little for a great praise. Only this commendation can I afford her, that were she other than as she is, she were unhandsome; and being no other than as she is, I do not like her.' Short and dark are evidently not to Benedick's taste; and as he declares that 'her cousin, were she not possessed with a fury, exceeds her as much in beauty as the first of May doth the last of December,' we may reasonably infer that dear Lady Disdain, merry-hearted, quick-witted Beatrice resembled Rosalind, and was tall and fair, although her prototype Rosaline, in *Love's Labour's Lost*, was

A witty wanton with a velvet brow,
With two pitch-balls stuck in her face for eyes.

Kate the curst, another bitter-tongued damsel, was also dark-skinned :

Straight and slender, and as brown in hue
As hazel-nuts.

Romeo's first love, the hard-hearted wench with the high forehead, was black-eyed. To rare Imogen, and her only, has Shakspeare given eyes of

White and azure, laced
With blue of heaven's own tinct.

Unless we allow, as we suspect we must, that with him blue and gray eyes are synonymous, as in *Venus* and *Adonis* he makes the goddess say :

My eyes are gray and bright ;

and immediately afterwards designates them as 'her blue windows.' Malvolio's mistress, the Lady Olivia, enumerates among her facial possessions : 'Item, two gray eyes with lids to them ;' and both Silvia and Julia own orbs of that hue. The latter, says :

Her eyes are gray as glass, and so are mine.

Mr Collier's annotator, we are aware, makes this 'green as glass,' a reading that, with all due deference to the illustrious unknown, we unhesitatingly reject : first, because the comparison of eyes with glass is of frequent occurrence in Shakspeare ; secondly, because ladies with eyes of that jealous tint are not common enough to render it at all likely that both the Gentlemen of Verona should be smitten with cat-eyed maidens ; and, lastly, because we are sure most men agree with the song, that

Her eyes may be e'en any colour but green.

Of the many good gifts necessary to make up that earthly divinity, a perfect woman, none is more indispensable than a pleasant voice, like Cordelia's,

Ever soft,
Gentle and low, an excellent thing in woman.

Sweet Anne Page

Has brown hair, and speaks small ;

and Marc Antony's second wife, Octavia, according to the poet, was 'low-voiced.' However, in the opinion of the lovely serpent of Old Nile, this was a defect rather than a merit ; on hearing it, Cleopatra exclaims : 'He cannot like her long !' Her rival, moreover, is dwarfish, round-faced, with a low forehead and brown hair ; an inventory of charms that leaves 'the lass unparalleled' undismayed. 'This creature's no such thing,' is the verdict of the famous gipsy whose hand

Kings
Have lipped, and trembled kissing.

Shakspeare's own mysterious mistress, whose treachery he so beautifully bewails in the Sonnets, was apparently a dark lady :

If snow be white, why then her breasts are dun ;
If hairs be wires, black wires grow on her head.

And he seems astonished and half-ashamed of his taste, writing as if in wonderment :

In the old age black was not counted fair,
Or if it were, it bore not beauty's name.

Indeed, jetty, and even brown locks were out of favour with the poets then ; they all agree in paying measured tribute to ladies

Golden tressed
Like Apollo.

Merry Lady Rosaline, in *Love's Labour's Lost*, twits her pock-marked companion, Katharine, as

My golden letter :
O that your face were not so full of O's ;

whilst her lover, Dumain, vows

Her amber hairs for foul have amber coted.

False Cressid, on parting from Troilus, threatens to 'tear her bright hair,' of which her officious uncle says : 'An her hair were not somewhat darker than Helen's, there were no comparison between the women ;' proving the lighter the hair, the higher its estimation. Chaste Lucrece's tresses,

Like golden threads, played with her breath ;
and we are told of Portia, the wise young judge, whose maiden assize was such a success, that her

Sunny locks
Hang on her temples like a golden fleece,

forming a

Golden mesh to entrap the hearts of men,
Easier than gnats in cobwebs.

Tasso's witch-beauty, Armida, had amber locks, that behind her veil shewed like

The golden sun behind a silver cloud ;
and amazonian Clorinda, unhelmed by Tancred, on her shoulders displayed

Her golden locks,
Like sunny beams on alabaster rocks.

Milton, too, swells the throng of gold-worshippers ; he sings of Mother Eve, who,

As a veil, down to her slender waist
Her unadorned golden tresses wore,
Dishevelled, but in wanton ringlets waved,
As the vine curls her tendrils.

The golden-haired age seems to have passed away ; we rarely see any now. We judge beauty by a more mercenary metallic standard than that of tresses of angel-gold. Lucrezia Borgia had such locks ; we believe the Vatican still counts one of them among its treasures. The beautiful ill-fated Beatrice Cenci is also described as having hair 'like threads of gold, which, when she let it flow loosely, the wavy splendour of it was astonishing.' Some assert that what our gallant forefathers complimented as golden, we, their more matter-of-fact sons, admire as auburn, or abominate as red. Auburn, we take to be a reddish brown, and we cannot believe that the fiery hue itself could ever have called forth such panegyrics ; besides, Shakspeare's Julia, comparing her hair with that of Silvia, says :

Her hair is auburn, mine is perfect yellow.

So we must allow that golden-haired lasses existed to charm our ancestors, if none are left to witch ourselves.

Having some reason to upbraid womankind, it is to the credit of Shakspeare and the ladies of his time, that in all his plays we find but three inconstant dames—the false Greek Cressida, and Lear's cruel daughters. The dramatist's fair creations were undoubtedly founded on his own countrywomen, and do them honour ; but we wonder if they were as ready to take the initiative as his heroines, of whom no less than seven—Miranda, Juliet, Olivia, Viola, Rosalind, Helena, and Desdemona—use the privilege popularly conceded in leap-year only. But then how sweetly they do it ! He were more or less than man

to refuse affection so daintily proffered. If the maiden subjects of good Queen Bess resembled them in this particular, bachelors must have had a hard time of it.

THE DINNER COMMISSARIAT.

A THOROUGH account of the gastronomic tastes of the principal nations of the world would almost comprise a physical description of the globe, so much does the food of each nation depend upon its soil, its climate, and its inland or maritime position. The humble inhabitant of Yarmouth or Schevening has a variety of crustaceous delicacies at a moderate cost, which would make the mouths of the inhabitants of the Alps water. On the other hand, the truffles and ortolans of Central France, the chamois of the Styrian mountains, and the pheasants of Bohemia, which are considered the greatest delicacies of the wealthy in the other parts of Europe, may be seen at the tables of the peasant in these countries; and are altogether inaccessible, and almost unknown, to the daintiest fish-taverns of the coasts of Holland and England. Game is usually considered the greatest delicacy of the European table. But in those mountainous countries where it abounds, sea-fish and colonial luxuries scarcely penetrate. And, on the other hand, the poorer and middling classes of maritime districts have, in addition to great varieties of fish, those numerous luxuries which commerce transports from the productive tropics to the colder regions of Europe.

In Britain, the domestic *cuisine* is poor in all that relates to art; but this is made up for by the humidity of the climate producing pastures of unsurpassed richness, and, consequently, animal food of the best quality, which does not require so much art in preparation. The great business of assimilation is carried on not in pots and pans, but in the digestive organs of the sheep and cattle. We are very far from having acquired the French art of combining varieties of fragrant vegetables with animal food; for in that lies the undoubted superiority of French cookery to our own. But our large colonial trade enables us to present a great multitude of accessories, which may be had at a moderate price, and are seen habitually on the tables of our middle classes. Our fish is also so excellent, that fastidious foreigners, who apply the word *gargote* to certain popular French restaurants of London, generally pronounce themselves satisfied with Greenwich fish-dinners. Still, notwithstanding the freshness and excellence of our fish, there can be no doubt of certain French preparations being superior to our own; such, for instance, as a *matelote* of eels, and certain other fish combined in frying with fine herbs, or in sauce with choice tubercules.

Great Britain does not produce wines; our consumption is therefore much less than on the continent; but the average quality is better, as an inferior article would not pay the expense of importation. A great change, however, has taken place in our customs respecting wine, which, two centuries ago, was the habitual drink, not only of the middle, but even of the lower classes. In Edinburgh, there was, up to a very recent period, a large consumption of French wine by the middle classes; and in the last century, previous to the French revolutionary war, every tavern in the High Street had its hogsheads of claret. We have heard, in our younger days, the late venerable Alexander Naysmith say, that when a publican broached a particularly good hogshead, his house was full until it was emptied. But our ales and beers are justly renowned all over the world; although, to our taste, nothing of the kind, not even India Pale Ale, is equal in flavour to good Bavarian beer.

The meat of Germany is not by any means so good as that of Britain; but the cookery is good, when one gets used to it—in fact, all things considered, better

than our own. (We do not speak of the cookery of the wealthy classes, who, in all countries of Europe, have an eclectic system, of which the French school is the basis.) Mature beef was, until lately, rarely roasted in Germany, being reserved for the eternal bouilli; veal was usually committed to the spit. Vegetables are much better prepared in Germany than in England; and the variety called *sauer kraut* has now been naturalised in the cookery of France. We may say the same of the sausage, which now figures frequently on the tables of the best restaurants on the Boulevard or the Palais Royal.

There are, however, considerable differences in the cookery of the various parts of Germany. In Westphalia, Hanover, and Lower Germany, generally, it is greasy. In Berlin and Old Prussia, the meat and game are poor, in consequence of the extensive tracts of sandy and fir-grown country. Travellers have often been surprised at the great superiority of the food of Berlin now, as compared with what it was twenty years ago. The soil and climate have in nowise altered; but the fact is, the railways which now stretch into the richest parts of Silesia, and other productive countries, have brought about this gastronomic revolution, which has caused an extraordinary rise of prices in those rural districts.

On the Upper Rhine, in Württemberg and Bavaria, the *cuisine* is closely assimilated to that of France. In fact, Alsace produces one of the most fatal delicacies of the French table—the *pâté de foie gras* of *Strasbourg*, the excellence of which was the great pride of the dinners of Cambacérès. It is well known that the liver of the goose is unnaturally swelled and fattened; but, however great a delicacy the *pâté* may be considered, there can be no doubt of its being most indigestible, if taken in any but infinitesimal doses. The recipe of a French reprobate for killing off a rich uncle, was to give him (a gourmand, it may be presumed) a dish of *pâté de foie gras* of extraordinary richness, and to announce during the process of laborious digestion the failure of his banker.

The cookery of Vienna is excellent, and is a combination of that of France, introduced by the imported cooks of the wealthy noblesse, and the native school. Game is prominent in it, as every one knows, who considers the natural facilities of the country, and who has seen the Wildpret Markt in Vienna, for there is a market exclusively for game. The Bohemian pheasants are considered the best in Europe; and of quadruped game, undoubtedly the most succulent, without producing satiety, is the chamois, when fat, well grown, and of the right age. In Hungary, there are two national dishes—the *paprika* fowl; that is to say, the ordinary fowl dressed with a sauce in which the fative red pepper of Hungary figures. In colour, this resembles cayenne, but has nothing of the pungent strength of the South American plant. The other national dish is the *gulas*; but any one familiar with oriental cookery, at once recognises its origin. It is, in fact, the stew or *yahni* of the Arabs and Turks. In the south of Hungary, where there is a large growth of maize, it is extensively used, both in savoury and sweet preparations. When kneaded in small lumps or balls, it is excellent in soup, and it is equally delicious in puddings; so that we have always felt surprised that so cheap, nutritious, and agreeable farina should not be more extensively used in this country. The game in Hungary is abundant and excellent; the quails are fat, as they find in this region abundant food during their migration. The wild boar of the Carpathians is not to be omitted in our list of the gastronomic delicacies of Hungary. Certain wines are also good, and are largely consumed in Galicia and other parts of Poland; but unquestionably they do not by any means please the British palate so well as the wines of France, Spain, Portugal, and the

Rhine. We must except Tokay, however, which is a very sweet wine, like a liqueur; being less dry than Cyprus, and not so sweet as Malaga. The other wines celebrated in books of geography have rather a medicinal taste to a British or French palate. Meneser is, however, dark and sweet, and has a much nearer resemblance to Malaga than any wine we know. The Rhine grape has been lately introduced into Hungary with great success, as we have the Rhine flavour with perhaps less acidity. The peasantry consume much bacon and brandy, and never taste tea from one end of the year to another.

In Italy, we find the gastronomy determined in a great measure by the climate. The plains of the Po produce large quantities of rice, which figure both in the mid-day and evening meal. Maize or Indian corn, called *polenta*, is also a staple food, to which we may also add various preparations of paste called macaroni, vermicelli, and tagliarini, so that the consumption of animal food is moderate; and, owing to the abundance of grain, poultry is cheap and good. The rich pastures of the Lombard territory are used not so much for cattle intended for the shambles, as for milch cows. Hence the rich cheeses known as Gorgonzola and Parmesan, which latter is produced principally in the neighbourhood of Lodi. Of all cheeses used for culinary purposes, Parmesan is preferred. Most cheeses that grate easily are poor; Parmesan grates easily, and is rich. It is therefore extensively used, not only to powder all the native pastes, but no soup is ever presented in Italy without a plate of grated Parmesan; and the custom has been gradually extended to the well-appointed tables of London. There is another characteristic of the geographical distribution of culinary art worthy of mention. The low banks of the Po and the Adige near their mouths, and all the territory of Ravenna, furnish excellent food for the domestic hog in the roots found on the banks of the rivers; hence the pork is much more cleanly fed than in the neighbourhood of large towns, where porcine food is often corrupt animal matter. From this is made the famed Bologna sausages, exported to all parts of Europe. The chief delicacy of the locality is the fresh-pork chops served up on a basis of Indian corn resembling our Yorkshire pudding.

The fish of the Italian coasts is not, in our opinion, equal to that of the northern seas; for what reason, we cannot divine. The tunny and sturgeon, although satisfying, are not delicate fish; but the barbone or red mullet is remembered by all travellers. Oysters are generally diminutive.

We have not had the advantage of travelling in Spain, nor have we heard very favourable accounts of the cuisine of that country; but it were superfluous to praise her fruits and wines, which are so highly esteemed, and so extensively used in this country. Her large juicy olives, her Valencia almonds, her Malaga raisins, her Seville oranges, and her Cadiz wines, are seen on every table. But an extensive use of garlic has not yet been made, even by those in this country who admire the continental schools of recondite cookery.

The cookery of the Turks is excellent, and chiefly consists of rice, fowls, mutton, and vegetables. Beef is unknown, except in a campaign, and is classed with horseflesh, and considered penitential fare; in fact, many Turks prefer horseflesh sausages to the best roast-beef. We need not say that the flesh of the hog is most rigorously forbidden. We are of opinion that in hot countries, the prohibition of the food of this animal may be supported on good sanitary grounds. It is unquestionably an impure feeding animal; and many piggeries in such countries as Egypt and Syria, would unquestionably promote plague, which is simply a virulent fever, having its cause in accumulations of

animal corruption. We have more than once seen ham on a table when a true Mussulman was present, and the feeling he manifested was not simply religious aversion, but positive loathing, such as the flesh of a rat might excite in us.

The Turkish preparation of rice, called *pilaff*, has become celebrated; the principle of which is, that every grain should be separate. The *yauri* or curdled milk is also celebrated, and when taken with a little sugar, is most refreshing. *Caimak* or clotted cream is another delicious lactic preparation, which all travellers relish. The Ottoman Empire being very large, and having a great variety of climates and populations, and the Ottomans being, except in Asia Minor, not a nation, but a dominant military caste, almost each province, or at least division of the empire, has its own culinary customs. In Albania, for instance, milk and the juices of animal food are mingled together, contrary to custom in other parts of Europe. In Servia and Bulgaria, soups are slightly acidulated with vinegar; and in the latter country, cabbage is eaten in a state of putrefaction; yet so abundant is grain in this province, that roast turkey is the traveller's daily fare. In all Turkish countries, lamb and mutton are roasted with great delicacy, sometimes with chopped vine-twigs below them, which gives a slight but delicious vinous flavour to the meat. Another excellent method of roasting lamb or mutton, is to place rice below it, so as to absorb all the gravy. The choice dishes of a good Turkish kitchen are not few: one of the most succulent is a preparation of the feet of sheep with herbs and white sauce, not unlike the French *pied de veau à la poulette*; but, as we think, superior.

The great characteristic of the food of the Egyptians is the universal use of the date and of onions. With this fruit and vegetable, and a little rice, the Egyptian peasant is satisfied with very little animal food, although it is very cheap, or at least was so some years ago. Fowls are largely used in Egypt, but being produced by artificial incubation, they are poor in flavour, lean and small. This artificial process brings forward the fowl *ab ovo*; but it would appear that, independently of mere warmth and covering, there are occult currents of animal fluid for which no ingenuity can provide a substitute.

OCEOLA:

A ROMANCE.

CHAPTER XIII.—THE CHASE.

I LOOKED around. Sure enough, the mulatto was making off.

The rencontre between Ringgold and the Indian monopolised attention, and the criminal was for the moment forgotten. The knife knocked out of Powell's hands had fallen at the feet of Yellow Jake. Unobserved in the confusion, he had snatched it up, cut the fastenings from his limbs, and glided off before any one could intercept him. Several clutched at him as he passed through the straggled groups; but, being naked, he was able to glide out of their grasp, and in a dozen bounds he had cleared the crowd, and was running towards the shore of the lake.

It seemed a mad attempt—he would be shot down or overtaken. Even so; it was not madness to fly from certain death—and such a death.

Shots were ringing; at first they were the reports of pistols. The guns had been laid aside, and were leaning against trees and the adjacent fence.

Their owners now ran to seize them. One after another was levelled; and then followed a sharp rapid cracking, like file-firing from a corps of riflemen.

There may have been good marksmen among the party—there were some of the best—but a man running for his life, and bounding from side to side, to avoid the stumps and bushes, offers but a very uncertain aim; and the best shot may miss.

So it appeared on this occasion. After the last rifle rang, the runaway was still seen keeping his onward course, apparently unscathed.

The moment after, he plunged into the water, and swam boldly out from the shore.

Some set to reloading their guns; others, despairing of the time, fling them away; and hastily pulling off hats, coats, and boots, rushed down to the lake, and plunged in after the fugitive.

In less than three minutes from the time that the mulatto started off, a new tableau was formed. The spot that was to have been the scene of execution was completely deserted. One half the crowd was down by the shore, shouting and gesticulating; the other half—full twenty in all—had taken to the water, and were swimming in perfect silence—their heads alone shewing above the surface. Away beyond—full fifty paces in advance of the foremost—appeared that solitary swimmer—the object of pursuit; his head of black tangled curls conspicuous above the water, and now and then the yellow neck and shoulders, as he forged forward in the desperate struggle for life.

A strange tableau it was; and bore strong resemblance to a deer-hunt—when the stag, close pressed, takes to the water; and the hounds, in full cry, plunge boldly after—but in this chase were the elements of a still grander excitement: both the quarry and the pack were human.

Not all human—there were dogs as well—hounds and mastiffs mingled among the men, side by side with their masters in the eager purpose of pursuit. A strange tableau indeed!

Stray shots were still fired from the shore. Rifles had been reloaded by those who remained; and now and then the plash of the tiny pellet could be seen, where it struck the water far short of the distant swimmer. He needed no longer have a dread of danger from that source; he was beyond the range of the rifles.

The whole scene had the semblance of a dream. So sudden had been the change of events, I could scarcely give credit to my senses, and believe it a reality. But the moment before, the criminal lay bound and helpless, beside him the pile upon which he was to be burnt—now was he swimming far and free, his executioners a hopeless distance behind him. Rapid had been the transformation—it hardly appeared real. Nevertheless, it was real—it was before the eyes.

A long time, too, before our eyes. A chase in the water is a very different affair from a pursuit on dry land; and, notwithstanding there was life and death on the issue, slow was the progress both of pursuers and pursued. For nearly half an hour we who remained upon the shore continued spectators of this singular contest.

The frenzy of the first moments had passed away; but there was sufficient interest to sustain a strong excitement to the last; and some continued to shout and gesticulate, though neither their cries nor actions could in anywise influence the result. No words of encouragement could have increased the speed of the pursuers; no threats were needed to urge forward the fugitive.

We who remained inactive had time enough to reflect; and upon reflection, it became apparent why the runaway had taken to the water. Had he attempted to escape by the fields, he would have been pulled down by the dogs, or else overtaken by swift runners, for there were many swifter than he. There were few better swimmers, however, and he knew it. For this reason, then, had he preferred the water to the

woods, and certainly his chances of escape seemed better.

After all, he could *not* escape. The island for which he was making was about half a mile from the shore; but beyond was a stretch of clear water of more than a mile in width. He would arrive at the island before any of his pursuers; but what then? Did he purpose to remain there, in hopes of concealing himself among the bushes? Its surface of several acres was covered with a thick growth of large trees. Some stood close by the shore, their branches draped with silvery tillandsia, overhanging the water. But what of this? There might have been cover enough to have given shelter to a bear or a hunted wolf, but not to a hunted man—not to a slave who had drawn the knife upon his master. No, no. Every inch of the thicket would be searched: to escape by concealing himself he might not.

Perhaps he only meant to use the island as a resting-place; and, after breathing himself, take once more to the water, and swim on for the opposite shore. It was possible for a strong swimmer to reach it; but it would not be possible for *him*. There were skiffs and pirogues upon the river, both up and down. Men had already gone after them; and, long before he could work his way across that wide reach, half-a-dozen keels would be cutting after him. No, no—he could not escape: either upon the island, or in the water beyond, he would be captured.

Thus reasoned the spectators, as they stood watching the pursuit.

The excitement rose higher as the swimmers neared the island. It is always so at the approach of a crisis; and a crisis was near, though not such a one as the spectators anticipated. They looked to see the runaway reach the island, mount up the bank, and disappear among the trees. They looked to see his pursuers climb out close upon his heels, and perhaps hear of his capture before he could cross through the timber, and take to the water on the other side.

Some such crisis were they expecting; and it could not be distant, for the mulatto was now close into the edge of the island; a few strokes would bring him to the shore: he was swimming under the black shadows of the trees—it seemed as if the branches were over his head—as if he might have thrown up his hands and clutched them.

The main body of his pursuers was still fifty yards in his rear; but some, who had forged ahead of the rest, were within half that distance. From where we viewed them, they seemed far nearer; in fact, it was easy to fancy that they were swimming alongside, and could have laid hands on him at any moment.

The crisis was approaching, but not that which was looked for. The pursuit was destined to a far different ending from that anticipated either by spectators or pursuers. The pursued himself little dreamed of the doom that was so near—a doom awfully appropriate.

The swimmer was cleaving his way across the belt of black shadow; we expected next moment to see him enter among the trees, when all at once he was seen to turn side towards us, and direct his course along the edge of the island!

We observed this manœuvre with some astonishment—we could not account for it; it was clearly to the advantage of his pursuers, who now swam in a diagonal line to intercept him.

What could be his motive? Had he failed to find a landing-place? Even so, he might have clutched the branches, and by that means drawn himself ashore?

Ha! our conjectures are answered; yonder is the answer; yonder brown log that floats on the black water is *not* the trunk of a dead tree. It is not dead; it has life and motion. See! it assumes a form—the form of the great saurian, the hideous alligator!

Its gaunt jaws are thrown up, its scoloped tail is erect, its breast alone rests upon the water. On this as a pivot it spins round and round, brandishing its tail in the air, and at intervals lashing the spray aloft. Its bellowing is echoed back from the distant shores; the lake vibrates under the hoarse barytone, the wood-birds flutter and cry, and the white crane mounts screaming into the air.

The spectators stand aghast; the pursuers have poised themselves in the water, and advance no further. One solitary swimmer is seen struggling on; it is he who swims for his life.

It is upon him the eyes of the alligator are fixed. Why upon him more than the others? They are all equally near. Is it the hand of God who takes vengeance?

Another revolution, another sweep of its strong tail, and the huge reptile rushes upon its victim.

I have forgotten his crimes—I almost sympathise with him. Is there no hope of his escape?

See! he has grasped the branch of a live-oak; he is endeavouring to lift himself up—above the water—above the danger. Heaven strengthen his arms!

Ah, he will be too late; already the jaws— That crash? The branch has broken!

He sinks back to the surface—below it. He is out of sight—he has gone to the bottom! and after him, open-mouthed and eager, darts the gigantic lizard. Both have disappeared from our view.

The froth floats like a blanket upon the waves, clouting the leaves on the broken branch.

We watch with eager eyes. Not a ripple escapes unnoted; but no new movement stirs the surface, no motion is observed, no form comes up; and the waves soon flatten over the spot.

Beyond a doubt, the reptile has finished its work.

Whose work? Was it the hand of God who took vengeance?

So they are saying around me.

The pursuers have faced back, and are swimming towards us. None cares to trust himself under the black shadows of these island oaks. They will have a long swim before they can reach the shore, and some of them will scarcely accomplish it. They are in danger; but no, yonder come the skiffs and pirogues, that will soon pick them up.

They have seen the boats, and swim slowly, or float upon the water, waiting their approach.

They are taken in, one after another; and all—both dogs and men—are now carried to the island.

They go to continue the search—for there is still some doubt as to the fate of the runaway.

They land—the dogs are sent through the bushes, while the men glide round the edge to the scene of the struggle. They find no track or trace upon the shore.

But there is one upon the water. Some froth still floats—there is a tinge of carmine upon it—beyond a doubt it is the blood of the mulatto.

'All right, boys!' cries a rough fellow; 'that's 'blueskin's blood, I'll sartify. He's gone under an' no mistake. Durn the varmint! it's clean spoilt our sport.'

The jest is received with shouts of boisterous laughter.

In such a spirit talked the man-hunters, as they returned from the chase.

CHAPTER XIV.

RINGGOLD'S REVENGE.

Only the ruder spirits indulged in this ill-timed levity; others of more refined nature regarded the incident with due solemnity—some even with a feeling of awe.

Certainly it seemed as if the hand of God had interposed, so appropriate had been the punishment—

almost as if the criminal had perished by his own contrivance.

It was an awful death, but far less hard to endure than that which had been decreed by man. The Almighty had been more merciful; and in thus mitigating the punishment of the guilty wretch, had rebuked his human judges.

I looked around for the young Indian: I was gratified to find he was no longer among the crowd. His quarrel with Ringgold had been broken off abruptly. I had fears that it was not yet ended. His words had irritated some of the white men, and it was through his being there, the criminal had found the opportunity to get off. No doubt, had the latter finally escaped, there would have been more of it; and even as matters stood, I was not without apprehensions about the safety of the bold half-blood. He was not upon his own ground—the other side of the river was the Indian territory; and therefore he might be deemed an intruder. True, we were at peace with the Indians; but for all that, there was enough of hostile feeling between the two races. Old wounds received in the war of 1818 still rankled.

I knew Ringgold's resentful character—he had been humiliated in the eyes of his companions; for, during the short scuffle, the half-blood had had the best of it. Ringgold would not be content to let it drop—he would seek revenge.

I was glad, therefore, on perceiving that the Indian had gone away from the ground. Perhaps he had himself become apprehensive of danger, and recrossed the river. There he would be safe from pursuit. Even Ringgold dared not follow him to the other side, for the treaty laws could not have been outraged with impunity. The most reckless of the squatters knew this. An Indian war would have been provoked, and the supreme government, though not over-scrupulous, had other views at the time.

I was turning to proceed homeward, when it occurred to me that I would accost Ringgold, and signify to him my disapproval of his conduct. I was indignant at the manner in which he had acted—just angry enough to speak my mind. Ringgold was older than myself, and bigger; but I was not afraid of him. On the contrary, I knew that he rather feared me. The insult he had offered to one who, but the hour before, had risked life for us, had sufficiently roused my blood, and I was determined to reproach him for it. With this intention, I turned back to the crowd to look for him. He was not there.

'Have you seen Arens Ringgold?' I inquired of old Hickman.

'Yes—jest gone,' was the reply.

'In what direction?'

'Up river. See 'im gallop off wi' Bill Williams an' Ned Spence—desprit keen upon somethin' they 'peered.'

A painful suspicion flashed across my mind.

'Hickman,' I asked, 'will you lend me your horse for an hour?'

'My old critter? Sartint sure will I: a day, if you wants him. But Geordy, boy, you can't ride wi' your arm that away?'

'O yes; only help me into the saddle.'

The old hunter did as desired; and after exchanging another word or two, I rode off in the up-river direction.

Up the river was a ferry; and at its landing it was most likely the young Indian had left his canoe. In that direction, therefore, he should go to get back to his home, and in that direction Ringgold should not go to return to him, for the path to the Ringgold plantation led in a course altogether opposite. Hence the suspicion that occurred to me on hearing that the latter had gone up the river. At such a time it did

not look well, and in such company, still worse; for I recognised in the names that Hickman had mentioned, two of the most worthless boys in the settlement. I knew them to be associates, or rather creatures, of Ringgold.

My suspicion was that they had gone after the Indian, and of course with an ill intent. It was hardly a conjecture; I was almost sure of it; and as I advanced along the river-road, I became confirmed in the belief. I saw the tracks of their horses along the path that led to the ferry, and now and again I could make out the print of the Indian moccasin where it left its wet mark in the dust. I knew that his dress had not yet dried upon him, and the moccasins would still be saturated with water.

I put the old horse to his speed. As I approached the landing, I could see no one, for there were trees all around it; but the conflict of angry voices proved that I had conjectured aright.

I did not stop to listen; but, urging my horse afresh, I rode on. At a bend of the road, I saw three horses tied to the trees. I knew they were those of Ringgold and his companions, but I could not tell why they had left them.

I stayed not to speculate, but galloped forward upon the ground. Just as I had anticipated, the three were there—the half-blood was in their hands!

They had crept upon him unawares—that was why their horses had been left behind—and caught him just as he was about stepping into his canoe. He was unarmed—for the rifle I had given him was still wet, and the mulatto had made away with his knife—he could offer no resistance, and was therefore secured at once.

They had been quick about it, for they had already stripped off his hunting-shirt, and tied him to a tree. They were just about to vent their spite upon him—by flogging him on the bare back with cowhides which they carried in their hands. No doubt they would have laid them on heavily, had I not arrived in time.

'Shame, Arens Ringgold! shame!' I cried as I rode up. 'This is cowardly, and I shall report it to the whole settlement.'

Ringgold stammered out some excuse, but was evidently staggered at my sudden appearance.

'The durned Injun deserves it,' growled Williams.

'For what, Master Williams?' I inquired.

'For waggin' his jaw so impudent to white men.'

'He's got no business over here,' chimed in Spence; 'he has no right to come this side the river.'

'And you have no right to flog him, whether on this side or the other—no more than you have to flog me.'

'Ho, ho! That might be done too,' said Spence in a sneering tone, that set my blood in a boil.

'Not so easily,' I cried, leaping from the old horse, and running forward upon the ground.

My right arm was still sound. Apprehensive of an awkward affair, I had borrowed old Hickman's pistol, and I held it in my hand.

'Now, gentlemen,' said I, taking my stand beside the captive, 'go on with the flogging; but take my word for it, I shall send a bullet through the first who strikes!'

Though they were but boys, all three were armed with knife and pistol, as was the custom of the time. Of the three, Spence seemed most inclined to carry out his threat; but he and Williams saw that Ringgold, their leader, had already backed out, for the latter had something to lose, which his companions had not. Besides, he had other thoughts, as well as fears for his personal safety.

The result was that all three, after remonstrating with me for my uncalled-for interference in a quarrel that did not concern me, made an angry and somewhat awkward exit from the scene.

The young Indian was soon released from his

unpleasant situation. He uttered few words, but his looks amply expressed his gratitude. As he pressed my hand at parting, he said:

'Come to the other side to hunt whenever you please—no Indian will harm you—in the land of the red men you will be welcome.'

CHAPTER XV.

MAÏMEE.

An acquaintance thus acquired could not be lightly dropped. Should it end otherwise than in friendship? This half-blood was a noble youth, the germ of a gentleman. I resolved to accept his invitation, and visit him in his forest home.

His mother's cabin, he said, was on the other side of the lake, not far off. I should find it on the bank of a little stream that emptied into the main river, above where the latter expands itself.

I felt a secret gratification as I listened to these directions. I knew the stream of which he was speaking; lately I had sailed up it in my skiff. It was upon its banks I had seen that fair vision—the wood-nymph whose beauty haunted my imagination. Was it Maïmee?

I longed to be satisfied. I waited only for the healing of my wound—till my arm should be strong enough for the oar. I chafed at the delay; but time passed, and I was well.

I chose a beautiful morning for the promised visit, and was prepared to start forth. I had no companion—only my dogs and gun.

I had reached the skiff, and was about stepping in, when a voice accosted me; on turning, I beheld my sister.

Poor little Virgine! she had lost somewhat of her habitual gaiety, and appeared much changed of late. She was not yet over the terrible fright—its consequences were apparent in her more thoughtful demeanour.

'Whither goest thou, Georgy?' she inquired as she came near.

'Must I tell, Virgine?'

'Either that or take me with you.'

'What! to the woods?'

'And why not? I long for a ramble in the woods. Wicked brother! you never indulge me.'

'Why, sister, you never asked me before?'

'Even so, you might know that I desired it. Who would not wish to go wandering in the woods? Oh! I wish I were a wild bird, or a butterfly, or some other creature with wings; I should wander all over those beautiful woods, without asking you to guide me, selfish brother.'

'Any other day, Virgine, but, to-day'—

'Why but? Why not this very day? Surely it is fine?—it is lovely!'

'The truth, then, sister—I am not exactly bound for the woods to-day.'

'And whither bound? whither bound, Georgy?—that's what they say in ships.'

'I am going to visit young Powell at his mother's cabin. I promised him I should.'

'Ha!' exclaimed my sister, suddenly changing colour, and remaining for a moment in a reflective attitude.

The name had recalled that horrid scene. I was sorry I had mentioned it.

'Now, brother,' continued she after a pause, 'there is nothing I more desire to see than an Indian cabin—you know I have never seen one. Good Georgy! good Georgy! pray take me along with you!'

There was an earnestness in the appeal I could not resist, though I would rather have gone alone. I had a secret that I would not have trusted even to my fond sister. I had an indefinite feeling, besides, that

I ought not to take her with me, so far from home, into a part of the country with which I was so little acquainted.

She appealed a second time.

'If mother will give her consent'—

'Nonsense, Georgy—mamma will not be angry. Why return to the house? You see I am prepared; I have my sun-bonnet. We can be back before we are missed—you've told me it was not far.'

'Step in, siss! Sit down in the stern. There—yo-ho! we are off!'

There was not much strength in the current, and half an hour's rowing brought the skiff to the mouth of the creek. We entered it, and continued upward. It was a narrow stream, but sufficiently deep to float either skiff or canoe. The sun was hot, but his beams could not reach us; they were intercepted by the tupelo-trees that grew upon the banks—their leafy branches almost meeting across the water.

Half a mile from the mouth of the creek, we approached a clearing. We saw fields under cultivation. We noticed crops of maize, and sweet potatoes, with capsicums, melons, and calabashes. There was a dwelling-house of considerable size near the bank, surrounded by an enclosure, with smaller houses in the rear. It was a log structure—somewhat antique in its appearance, with a portico, the pillars of which exhibited a rude carving. There were slaves at work in the field—that is, there were black men, and some red men too—Indians!

It could not be the plantation of a white man—there were none on that side the river. Some wealthy Indian, we conjectured, who is the owner of land and slaves. We were not surprised at this—we knew there were many such.

But where was the cabin of our friend? He had told me it stood upon the bank of the stream not more than half a mile from its mouth. Had we passed without seeing it, or was it still higher up?

'Shall we stop, and inquire, Virgine?'

'Who is it standing in the porch?'

'Ha! your eyes are better than mine, siss—it is the young Indian himself. Surely he does not live *there*? That is not a cabin. Perhaps he is on a visit? But see! he is coming this way.'

As I spoke, the Indian stepped out from the house, and walked rapidly towards us. In a few seconds, he stood upon the bank, and beckoned us to a landing. As when seen before, he was gaily dressed, with plumed 'toque' upon his head, and garments richly embroidered. As he stood upon the bank above us, his fine form outlined against the sky, he presented the appearance of a miniature warrior. Though but a boy, he looked splendid and picturesque. I almost envied him his wild attire.

My sister seemed to look on him with admiration, though I thought I could trace some terror in her glance. From the manner in which her colour came and went, I fancied that his presence recalled that scene, and again I regretted that she had accompanied me.

He appeared unembarrassed by our arrival. I have known it otherwise among whites; and those too making pretensions to *haut ton*. This young Indian was as cool and collected as though he had been expecting us, which he was not. He could not have expected both.

There was no show of coldness in our reception. As soon as we approached near enough, he caught the stem of the skiff, drew her close up to the landing, and with the politeness of an accomplished gentleman, assisted us to debark.

'You are welcome,' said he—'welcome!' and then turning to Virginia with an inquiring look, he added:

'I hope the health of the señorita is quite restored. As for yours, sir, I need not inquire: that you have

rowed your skiff so far against the current, is a proof you have got over your mishap.'

The word 'señorita' betrayed a trace of the Spaniards—a remnant of those relations that had erewhile existed between the Seminole Indians and the Iberian race. Even in the costume of our new acquaintance could be observed objects of Andalusian origin—the silver cross hanging from his neck, the sash of scarlet-silk around his waist, and the long triangular blade that was sheathed behind it. The scene, too, had Spanish touches. There were exotic plants, the china orange, the splendid papaya, the capsicums (chilés) and love-apples (tomatoes); almost characteristics of the home of the Spanish colonist. The house itself exhibited traces of Castilian workmanship. The carving was not Indian.

'Is this your home?' I inquired with a little embarrassment.

He had bid us welcome, but I saw no cabin; I might be wrong.

His answer set me at rest. It was his home—his mother's house—his father was long since dead—there were but the three—his mother, his sister, himself.

'And these?' I inquired, pointing to the labourers.

'Our slaves,' he replied with a smile. 'You perceive we Indians are getting into the customs of civilisation.'

'But these are not all negroes? There are red men; are they slaves?'

'Slaves like the others. I see you are astonished. They are not of our tribe: they are *Yamassees*. Our people conquered them long ago; and many of them still remain slaves.'

We had arrived at the house. His mother met us by the door—a woman of pure Indian race—who had evidently once possessed beauty. She was still agreeable to look upon—well dressed, though in Indian costume—maternal—intelligent.

We entered—furniture—trophies of the chase—horse-accoutrements in the Spanish style—a guitar—ha! books!

My sister and I were not a little surprised to find, under an Indian roof, these symbols of civilisation.

'Ah!' cried the youth, as if suddenly recollecting himself, 'I am glad you are come. Your moccasins are finished. Where are they, mother? Where is she? Where is Matimee?'

He had given words to my thoughts—their very echo.

'Who is Matimee?' whispered Virgine.

'An Indian girl—his sister, I believe.'

'Yonder—she comes!'

A foot scarce a span in length; an ankle that, from the broidered flap of the moccasin, exhibits two lines widely diverging upward; a waist of that pleasing flexure that sweeps abruptly inward and out again; a bosom whose prominence could be detected under the coarsest draping; a face of rich golden brown; skin diaphanous; cheeks coral red; lips of like hue; dark eyes and brows; long crescent lashes; hair of deepest black, in wantonness of profusion!

Fancy such a form—fancy it robed in all the picturesque finery that Indian ingenuity can devise—fancy it approaching you with a step that rivals the steed of Arabia, and you may fancy—no, you may not fancy Matimee.

My poor heart—it was she, my wood-nymph!

I could have tarried long under the roof of that hospitable home; but my sister seemed ill at ease—as if there came always recurring to her the memory of that unhappy adventure.

We stayed but an hour; it seemed not half so long—but short as was the time, it transformed me into a man. As I rowed back home, I felt that my boy's heart had been left behind me.

CHAPTER XVI.

THE ISLAND.

I longed to revisit the Indian home; and was not slow to gratify my wish. There was no restraint upon my actions. Neither father nor mother interfered with my daily wanderings: I came and went at will; and was rarely questioned as to the direction I had taken. Hunting was supposed to be the purpose of my absence. My dogs and gun, which I always took with me, and the game I usually brought back, answered all curiosity.

My hunting excursions were always in one direction—I need hardly have said so—always across the river. Again and again did the keel of my skiff cleave the waters of the creek—again and again, till I knew every tree upon its banks.

My acquaintance with young Powell soon ripened into a firm friendship. Almost daily were we together—either upon the lake or in the woods, companions in the chase; and many a deer and wild turkey did we slaughter in concert. The Indian boy was already a skilled hunter; and I learned many a secret of wood-craft in his company.

I remember well that hunting less delighted me than before. I preferred that hour when the chase was over, and I halted at the Indian house on my way home—when I drank the honey-sweetened *conté* out of the carved calabash—far sweeter from the hands out of which I received the cup—far sweeter from the smiles of her who gave it—Maïmee.

For weeks—short weeks they seemed—I revelled in this young dream of love. Ah! it is true there is no joy in after-life that equals this. Glory and power are but gratifications—love alone is bliss—purest and sweetest in its virgin bloom.

Often was Virginia my companion in these wild wood excursions. She had grown fond of the forest—she said so—and willingly went along. There were times when I should have preferred going alone; but I could not gainsay her. She had become attached to Maïmee. I did not wonder.

Maïmee, too, liked my sister—not from any resemblance in character between them. Physically, they were unlike as two young girls could well be. Virginia was all blonde and gold; Maïmee, damask and dark. Intellectually, they approached no nearer. The former was timid as the dove; the latter possessed a spirit bold as the falcon. Perhaps the contrast drew closer the ties of friendship that had sprung up between them. It is not an anomaly.

Far more like an anomaly was my feeling in relation to the two—I loved my sister for the very softness of her nature. I loved Maïmee for the opposite; but, true, these loves were very distinct in kind—unlike as the objects that called them forth.

While young Powell and I hunted, our sisters stayed at home. They strolled about the fields, the groves, the garden. They played and sang and read, for Maïmee—despite her costume—was no savage. She had books, a guitar, or rather a bandolin—a Spanish relic—and had been instructed in both. So far as mental cultivation went, she was fit society even for the daughter of a proud Randolph. Young Powell, too, was as well, or better educated than myself. Their father had not neglected his duty.

Neither Virginia nor I ever dreamed of an inequality. The association was by us desired and sought. We were both too young to know aught of *caste*. In our friendships we followed only the prompting of innocent nature; and it never occurred to us that we were going astray.

The girls frequently accompanied us into the forest; and to this we, the hunters, made no objection. We did not always go in quest of the wide-ranging

stag. Squirrels and other small game were oftener the objects of our pursuit; and in following these we needed not to stray far from our delicate companions.

As for Maïmee, she was a huntress—a bold equestrian, and could have ridden in the 'drive.' As yet, my sister had scarcely been on horseback.

I grew to like the squirrel-shooting best; my dogs were often left behind; and it became a rare thing for me to bring home venison.

Our excursions were not confined to the woods. The water-fowl upon the lake, the ibises, egrets, and white cranes, were often the victims of our hunting ardour.

In the lake, there was a beautiful island—not that which had been the scene of the tragedy, but one higher up—near the widening of the river. Its surface was of large extent, and rose to a summit in the centre. For the most part, it was clad with timber, nearly all evergreen—as the live-oak, magnolia, illicium, and wild orange—indigenous to Florida. There were *zanthoxylon* trees, with their conspicuous yellow blossoms; the perfumed flowering dogwood, and many sweet-scented plants and shrubs—the princely palm towering high over all, and forming, with its wide-spread umbels, a double canopy of verdure.

The timber, though standing thickly, did not form a thicket. Here and there, the path was tangled with epiphytes or parasites—with enormous gnarled vines of the fox-grape—with *bignonias*—with china and sarsaparilla briers—with bromelias and sweet-scented orchids; but the larger trees stood well apart; and at intervals there were openings—pretty glades, carpeted with grass, and enamelled with flowers.

The fair island lay about half-way between the two homes; and often young Powell and I met upon it, and made it the scene of our sport. There were squirrels among the trees, and turkeys—sometimes deer were found in the glades—and from its covered shores we could do execution among the water-fowl that sported upon the lake.

Several times had we met on this neutral ground, and always accompanied by our sisters. Both delighted in the lovely spot. They used to ascend the slope, and seat themselves under the shade of some tall palms that grew on the summit; while we, the hunters, remained in the game-frequented ground below, causing the woods to ring with the reports of our rifles. Then it was our custom, when satiated with the sport, also to ascend the hill, and deliver up our spoils, particularly when we had been fortunate enough to procure some rare and richly plumed bird—an object of curiosity or admiration.

For my part, whether successful or not, I always left off sooner than my companion. I was not so keen a hunter as he; I far more delighted to recline along the grass where the two maidens were seated: far sweeter than the sound of the rifle was it to listen to the tones of Maïmee's voice; far fairer than the sight of game was it to gaze into the eyes of Maïmee.

And beyond this, beyond listening and looking, my love had never gone. No love-words had ever passed between us; I even knew not whether I was beloved.

My hours were not all blissful; the sky was not always of rose-colour. The doubts that my youthful passion was returned were its clouds; and these often arose to trouble me.

About this time, I became unhappy from another cause. I perceived, or fancied that Virginia took a deep interest in the brother of Maïmee, and that this was reciprocated. The thought gave me surprise and pain. Yet why I should have experienced either, I could not tell. I have said that my sister and I were too young to know ought of the prejudices of rank or caste; but this was not strictly true. I must have had some instinct, that in this free association

with our dark-skinned neighbours we were doing wrong, else how could it have made me unhappy? I fancied that Virginia shared this feeling with me. We were both ill at ease, and yet we were not confidants of each other. I dreaded to make known my thoughts even to my sister, and she no doubt felt a like reluctance to the disclosing of her secret.

What would be the result of these young loves if left to themselves? Would they in due time die out? Would there arrive an hour of satiety and change? or, without interruption, would they become perpetual? Who knows what might be their fate, if permitted to advance to perfect development. But it is never so—they are always interrupted.

So were ours—the crisis came—and the sweet companionship in which we had been indulging was brought to a sudden close. We had never disclosed it to our father or mother, though we had used no craft to conceal it. We had not been questioned, else should we certainly have avowed it; for we had been taught strictly to regard truth. But no questions had been asked—no surprise had been expressed at our frequent absences. Mine, as a hunter, were but natural; the only wonderment was that Virginia had grown so fond of the forest, and so often borne me company; but this slight surprise on the part of my mother soon wore off, and we went freely forth, and as freely returned, without challenge of our motives.

I have said that we used no art to conceal who were our associates in these wild wanderings. That again is not strictly true. Our very silence was craft. We must both have had some secret perception that we were acting wrongly—that our conduct would not meet the approval of our parents—else why should we have cared for concealment?

It was destined that this repose should not be of long continuance. It ended abruptly—somewhat harshly.

One day we were upon the island, all four as usual. The hunt was over, and Powell and I had rejoined our sisters upon the hill. We had stretched ourselves under the shade, and were indulging in trivial conversation, but I far more in the mute language of love. My eyes rested upon the object of my thoughts, too happy that my glances were returned. I saw little besides: I did not notice that there was a similar exchange of ardent looks between the young Indian and my sister. At that moment I cared not; I was indifferent to everything but the smiles of Matimee.

There were those who did observe this exchange of glances, who saw all that was passing. Anxious eyes were bent upon the tableau formed by the four of us, and our words, looks, and gestures were noted.

The dogs rose with a growl, and ran outward among the trees. The rustling of branches, and garments shining through the foliage, warned us that there were people there. The dogs had ceased to give tongue, and were wagging their tails. They were friends, then, who were near.

The leaves sheltered them no longer from our view: behold my father—my mother!

Virginia and I were startled by their appearance. We felt some apprehension of evil—arising, no doubt, from our own convictions that we had not been acting aright. We observed that the brows of both were clouded. They appeared vexed and angry.

My mother approached first. There was scorn upon her lips. She was proud of her ancestry, even more than the descendant of the Randolphs.

'What!' exclaimed she—'what, my children? these your companions? Indians?'

Young Powell rose to his feet, but said nothing in reply. His looks betrayed what he felt; and that he perfectly understood the slight.

With a haughty glance towards my father and

mother, he beckoned to his sister to follow him, and walked proudly away.

Virginia and I were alarmed and speechless. We dared not say adieu.

We were hurried from the spot; and homeward Virginia went with my father and mother. There were others in the boat that had brought them to the island. There were blacks who rowed; but I saw white men too. The Ringolds—both father and son—were of the party.

I returned alone in the skiff. While crossing the lake, I looked up. The canoe was just entering the creek. I could see that the faces of the half-blood and his sister were turned towards us. I was watched, and dared not wave an adieu, although there was a sad feeling upon my heart—a presentiment that we were parting for long—perhaps for ever!

Alas! the presentiment proved a just one. In three days from that time I was on my way to the far north, where I was entered as a cadet in the military academy of West Point. My sister, too, was sent to one of those seminaries, in which the cities of the Puritan people abound. It was long, long before either of us again set eyes upon the flowery land.

THE SUPER-MARINE TELEGRAPH.

PEOPLE on shore have been so much taken up with their newly acquired faculty of flashing their thoughts from one to another over land and under sea, that few of them have been thinking how it is in respect to communication between floating communities on the sea's surface. But those who watch over our shipping interests have not lost sight of this important matter; and although no such grand step has been made as when the electric telegraph superseded the old semaphore by land, yet such an improvement has been introduced within the last few years into the system of super-marine telegraphing, if we may be allowed to coin a word, as almost amounts to a revolution.

Sea-signals, as everybody is aware, are made by flags of various shapes and colours. They are comparatively of modern date, and nothing like a general code of signals was in use even in the royal navy until about the close of the last century. Sir Home Popham, in the year 1803, introduced into the navy a form of telegraph, which has been the foundation of all subsequent ones.

It was founded on the *numeral* principle, having a distinct flag to represent each of the ten figures 0, 1, 2...9; so that by combinations of these flags, any number up to 9999 could be expressed. The letters of the alphabet, together with the words and sentences most in use in naval communications, were then arranged alphabetically in a signal-book, and each letter, word, and sentence had a special number appropriated to it. It was by this telegraph that Nelson addressed to his fleet at Trafalgar the well-known words:

258 269 863 261 471 958 220 370 4 21 19 24
England expects that every man will do his duty

The inconvenience and limited scope of the numerical method led to its abandonment in the British navy in 1839, and the substitution of the twenty-six letters of the alphabet. Those of our readers unacquainted with what mathematicians call 'the doctrine of permutations,' will hardly be prepared for the statement, that with twenty-six flags representing the letters of the alphabet, it is possible to make upwards of 16,000 distinct signals without displaying more than three flags at one hoist.

The merchant service, beyond an established signal

for need of a pilot and one or two other points, had no system of signals till 1817, when Captain Marryat, R.N., published the code still known by his name. This system came into extensive use in Britain, and, with modifications, was adopted in France, the United States, and other countries. It differs little from the code of Sir Home Popham, operating by means of flags representing figures; and the perplexities and difficulties attending its use increased with increasing commerce, and were more and more felt as other means of communication advanced towards perfection. Accordingly, in 1855, the Board of Trade appointed a committee of officers and gentlemen connected with the royal and mercantile marine 'to inquire into and report upon the subject of a code of signals to be used at sea.'

One essential step had already been taken, without which no radical reform would have been possible. Perhaps the most frequent subject of communication at sea is the name of the vessel. Now we all know how little it does in individualising a man to tell us that his name is John Smith; and the case is much the same with ships. Thus there are endless *Marys* in the marine of Great Britain, and sometimes several belonging to the same port. 'In order to identify a ship, so as to distinguish her from others of the same name, it was therefore necessary, to make known not only her name, but her port of registry, and number, and year of registry. Again, it often happened that ships, when sold, changed their port of registry, obtained a new number, and even a new name, in their new port, and so their characters were altogether changed.' Thus to individualise a vessel required repeated hoists of a variety of signals; and the operation, being tedious and troublesome, was often omitted when the communication would have been desirable. This evil was effectually remedied by the Merchant Shipping Act of 1854, which provides that every registered British vessel shall have a distinct number, in addition to her local number in a particular port. This 'official number' is permanently marked on the vessel's mainbeam, and remains invariable through all changes of port or ownership; and in the *Mercantile Navy List*, now published by authority annually, and with monthly supplements, the official numbers are placed in order against the vessels to which they belong. If such an official number, then, is signalled by symbols agreed upon, whoever has a copy of the shipping list can know, without a risk of mistake, what ship is meant.

This preliminary matter being settled, the committee above named resolved to reject the numeral system of signals, and have recourse to letters. In the code of signals contrived by them, eighteen flags are used, all readily distinguishable from one another by means of shape and colour, and each flag is made to represent one of the eighteen consonants of the English alphabet. The letters, be it remembered, are not used as letters to represent sounds, but as *signs*, to which arbitrary meanings are affixed. Let us see now how many distinct signals can be made with these eighteen flags. To begin with signals of two flags, single signs not being reckoned. The pair of flags, B and C, will form two signals, meaning one thing when B is uppermost, and another when C is uppermost; the same is the case with the pair B and D; and thus by ringing the changes on all the possible pairs, any one that will take the pains to try will find that no fewer than 306 permutations or distinct signals can be formed. In like manner, by hoisting three flags at a time, we get 4896 different permutations; and with hoists of four flags at a time, the permutations amount to 73,440. If it were convenient to use five flags at once, as many as 1,028,160 would be got; but as it is practically found essential that a signal be made at one hoist, with the flags all in a row, one above another, the employment

of more than four flags for one signal is liable to serious objections, and the necessity of this in the numeral systems was one of their chief faults. Confining the grouping of the flags or the letters they symbolise, then, to hoists of two, three, and four, the total number of distinct signals afforded is 78,642.

A large proportion of these signals requires to be appropriated to telegraphing the official numbers of the ships composing the mercantile navy of Great Britain. The present number of registered vessels is about 35,000, and to provide for increase, and for the numbers vacant between their lapse, owing to the loss or condemnation of the ship, and their appropriation to new vessels, a range of 50,000 numbers must be provided, each with its own signal. These signals for numbers are all composed of four signs; and they have a distinctive character given them by being so contrived that the uppermost symbol in the hoist is always a square flag. In the *Mercantile Navy List*, containing the name and official number of every registered ship, there is joined with the official number its appropriated signal of four letters, corresponding with four flags, the numbers being arranged successively, and the single letters alphabetically, so that either the number or the letters signifying it are readily found. In this way, 'if the whole mercantile navy of Great Britain were at anchor together, and every vessel making her number at the same time, each one might be individualised by the four distinguishing flags composing her special signal.'

After providing for signaling the numbers of vessels, the system leaves upwards of 20,000 distinct signals for general subjects. In the 'Commercial Code of Signals for the Use of All Nations,' drawn up by the committee already spoken of, and published by authority of the Board of Trade, these subjects are classified, and each word or sentence has its appropriate symbol or group of letters prefixed. The ingenious arrangements by which simplicity in the act of signaling and ease of reference and interpretation are secured, could not be made intelligible unless the reader had the book in his hand. But one feature of the system deserves special notice—namely, that it is calculated to be *international*. The letters corresponding to the flags, not being used to spell words, but to signify things, their meaning is the same whether displayed from an English or from a French ship; in the French signal-book, the meaning of the symbols would of course be expressed in French. This is a real step towards a universal language; and it is earnestly to be hoped that before long the system will be in general use all over the world. The commercial code has been strongly recommended by the committee of Lloyd's, and by the ship-owners' associations of London and Liverpool; and active means are being taken to provide vessels with the necessary signals and books, and to secure its speedy and general adoption. It appears that the flags used in Marryat's code can, with the addition of four new ones, be applied to the commercial code, and that in the present state, captains of ships may, without much difficulty, avail themselves of either, as necessity requires.* It ought also to be mentioned, that a book of tables has been published, called the *Companion to the Commercial Code of Signals*, and henceforth to form part of the library of every ship-captain; by means of which, one ship may communicate to another, in one signal of three flags, the latitude or longitude, a matter often of vital moment. Who will say now that mariners have not their telegraph, as well as landmen?

* See *Sea-signals Assimilated* (Charles Wilson, London): a tract, price 1s., containing a full account of the whole subject. It is drawn up, we presume, under the auspices of Mr J. H. Brown, Registrar-general of Seamen, who has been a prime mover in this and other recent measures for the improvement of our mercantile marine.

VICTORIA BRIDGE AT MONTREAL.

IMAGINE a bridge seven times and a half longer than Waterloo Bridge, or not a great deal less (176 feet) than two miles; imagine the span between the central piers to be 330 feet wide, and the other spans—twenty-four of them—242 feet; imagine this bridge to be a tube, like the one over the Menai Strait; and you will have a general idea of a work now actually in progress—the Victoria Bridge at Montreal. But the idea will be a very vague one; and to bring it more into shape, you must imagine that the river spanned by the monster tube runs frequently at the rate of ten miles an hour, and that it brings down the ice of 2000 miles of lakes and upper rivers with numerous tributaries, and piles it at Montreal to the height of thirty—forty—fifty feet. You will now obtain a notion of the necessary thickness and solidity of the work, and be able to suppose piers or supports, containing some 6000, and some 8000 tons of masonry. The whole weight of masonry in the bridge, when completed, will be about 220,000 tons, and the bulk three million cubic feet. The faces of the piers looking towards the current, terminate in a sharp-pointed edge, while the sides present to the avalanches of ice only smooth, bevelled-off surfaces. The stone is a dense blue limestone; 'scarcely a block of which,' says the *Canadian News*, from which we obtain these particulars, 'is less than seven tons weight, and many of those exposed to the force of the breaking-up ice weigh fully ten tons. The blocks are bound together, not only by the use of the best water-cement, but each stone is clamped to its neighbours in several places by massive iron rivets, bored several inches into each block, and the interstices between the rivet and the block are made one solid mass by means of molten lead.' The tubes will be from nineteen feet high to twenty-two and a half feet in the centre, and their uniform width will be sixteen feet, the rail-track being five feet six inches, the national railway-gauge of Canada. The total weight of iron in the tube will be 10,400 tons. The bridge, it is calculated, will cost altogether about £1,250,000. Mr Robert Stephenson and Mr M. A. Ross are the architects of this great work, and Messrs Peto, Brassey, and Betts the contractors. 'There can be no doubt,' says the *Canadian News*, 'that without the Victoria Bridge, the large and comprehensive traffic-system involved in the construction of the Grand Trunk Railway could only be partially, and, by comparison, ineffectually carried out at a very great cost. Montreal is the terminal point of the ocean-navigation, and is connected with the Lower St Lawrence and the ocean on one side, and with the great Canadian and American lakes—extending 2000 miles into the heart of the continent—on the other. It is also the centre from which lines of railway now radiate to Portland, Boston, and New York, and to which lines will converge from the Ottawa and the other rich, though as yet only partially developed districts of Canada.'

A RICHMOND DINNER THREE HUNDRED YEARS AGO.

We find, in the Lansdowne manuscripts, that about Christmas 1509, certain officials of the court of King Henry VIII. dined together at the village of Shene, now called Richmond; and that at the end of the entertainment, my host of the Star and Garter, with many salutations, handed to them the following bill: For brede, 12d.; ale, 3s. 4d.; wyne, 10d.; two leyenes moton, 8d.; maribones, 6d.; powdered beef, 6d.; two capons, 2s.; two geese, 14d.; five conyes, 15d.; one legge moton, 5 lb. weight, 4d.; six plovers, 18d.; six pegions, 5d.; two dozen larkes, 12d.; salt and sauce, 6d.; butter and eggs, 10d.; wardens and quynces, 12d.; herbes, 1d.; spices, 2s. 4d.; floure, 4d.; whight cuppes and cruses, 6d.: which, summed up, gives exactly £1.1 sterling as the total expenses of this aldermanic feast. Many a party, gentle and simple, has since that time dined at the Star and Garter, but none ever got so many substantial things for their twenty shillings as the subjects of young King Henry VIII.—*The Statesman*.

A LAY OF LUCKNOW.

ASLEEP!—amid the awful thunder
That speaks of coming doom,
While swarming hosts of fiendish foes
Round Lucknow's fortress loom.
Worn out by toil and suffering—
Death closing darkly round—
The daughters of the island-race
Lay on the hard, cold ground.

The Englishwoman's troubled rest
Is broken fitfully;
But hushed in motionless repose,
The head upon her knee,
A Scottish woman pillowed there,
Dreams of the far-off home,
Where her old father from the plough
At eventide will come.

What sudden sound 'mid that wild roar
The charmed vision breaks,
As springing from her kindly couch,
The Highland woman wakes?
The Scottish ear—the Scottish heart
'Mid that stern din of war,
Hears the shrill Highland bagpipe speak—
The slogan sound afar!

'We're saved! I hear Macgregor's peal,
Aye foremost in the fray—
Oh, Highland hearts and hands are true;
'We're saved this blessed day!
She stands amid the hero band
Who wage the hopeless strife,
The harbinger of coming aid,
Of rescued love and life.

They listen!—But that distant sound
Reaches no Saxon ear;
For them no Highland pibroch tells
That Scotland's aid is near,
Again the voice of war sends forth
Defiance stern and high;
Despairing, though undaunted still,
Are England's chivalry.

Once more that cry: 'The Campbells come!
'We're saved!'—They pause again.
O blessed Heaven! she speaketh sooth!
They hear the bagpipe's strain.
High 'mid the roar of deadly strife
The Highland music swells;
And of the God-sent aid, at hand,
The mountain slogan tells.

Down—as one man the leaguered force
Fall lowly on their knees,
And tears, and prayers, and bursting sighs
Float on the eastern breeze.
Full—fuller—swells the changing strain,
Borne through the rending line
Of conquered foes—They hear it now!
The sound of 'Auld Lang Syne.'

Oh! blessed be His holy name
Who, in our direst need,
Can thus, through swarthy myriads,
Our faithful comrades lead.
Yet even with the memory
Of mercy all divine,
Will come a ling'ring echo, too,
Of Scotland's 'Auld Lang Syne.'

THE ZEMINDAR.

At the present time, the landed aristocracy of India are invested with a more than common interest, and deserve something more than a mere passing notice. They hold in their hands the power of good and evil to an extent scarcely dreamed of in Europe, and for the reason, that in Asia all real power is highly despotic, especially in the provinces. If the petty trader, the writer, the agent, the broker, with a score of others of various grades and occupations, are constantly in the habit of tyrannising over those beneath them, how much more must we expect oppression from the all-powerful zemindar—the dispenser of life and property—the owner of not only all the broad acres within his zemindary, but of all the men, women, and children existing thereon.

In the northwest, it was long popularly supposed that civilisation had made great strides, that European ideas were fast triumphing over Asiatic prejudices and eastern habits, and that, in fact, the people were comparatively free, enlightened, and happy. Never was error more complete. Doubtless, more had been done by the government of the northwest towards preparing the people for better things, but in reality as little had been accomplished there as elsewhere. None but those who have laboured in an eastern climate know what it is to bear the heat of the day; none but those who have striven against the darkness and corruption of the Asiatic mind know how sadly slow the work progresses. Even the men for whom you are striving, the poor ryot, the oppressed trader, the poverty-stricken villager, all are dead against you. So strange are they to any generous sentiment, so shut out from sympathy with the rest of the world, that they cannot, they will not, place belief in the labours of the European in their behalf. They spurn the proffered aid; they turn away from protection, convinced in the dark recesses of their own diseased minds, that behind all the fair language and pleasant promises of the white man, there lurks some secret plot for their more complete bondage and destruction.

In reality, then, the tyrannical zemindar possesses fully as much power in the northwest as in Upper or Lower Bengal. We have said that he holds the power of life and property. This is not a mere figure of speech, but a stern, everyday matter of fact. The British authority is supposed to reign paramount over every other power within the limits of the Honourable Company's territories. Outwardly, this is indeed the case; but in reality it is a mere fiction. When the collector or the magistrate of the district passes through with a small army of retainers and native

officials on revenue or judicial tours of inspection, all is deep deference to the English name, and for the time it is highly convenient to allow the fiction to pass current; but, once out of sight, all idea of British supremacy vanishes, and the reign of the native recommences—the zemindar is again all-powerful for good or for evil. Alas, how seldom for the former!

The zemindar owns the land on which tens of thousands of his fellow-men have their being, dwell, toil, and die; but not only does he claim the soil by which they live—he insists on his right to everything it produces over and above their most pressing wants for the support of life; nay, he even sets up a claim to their liberty and their life. All are his, according to the popular reading of the Indian Rights of Man. Wo to the Bengalee who dares to think otherwise! Sad and certain, indeed, would be his fate.

Of course, all of this class are not precisely similar in their characters, dispositions, and mode of managing their zemindaries. There are well-defined varieties of the species. I have known men of rather enlarged views upon general matters, who have had an English education, mixed much with European society, were *au fait* at European politics, and whom one might have expected to have governed their ryots not only with a lenient, generous rule, but in an enlightened manner: these men would have scorned any personal acts of oppression, yet they could never be brought to recognise the ryot's claim to anything beyond a mere animal existence, and often, by their indifference to their affairs, permitted the grossest acts of extortion and tyranny.

Short-sighted as their policy undoubtedly is, inasmuch as the ryot labours no more than he can possibly avoid under this exacting system, they cannot be brought to believe in the possibility of liberality inducing greater exertion, or in the European theory of a prosperous tenantry making a fat landlord. The screw is placed on wherever it is deemed expedient; and unfortunately for both landlord and tenant, it is generally thought to be expedient. When we speak of the 'screw,' we do so in no figurative language, but as having reference to the actual thing done and performed; not always, though frequently, by the zemindar personally, or of his own knowledge, but by the subordinates and middle-men of the estate, whose name is closely resembling that of 'legion.' The zemindar is feared rather than loved.

Sreenath Deb Chunder Roy, a zemindar of large possessions in Lower Bengal, and personally known to me, may be very fairly taken as a sample of the general run of these landed aristocrats of British India. Of commanding figure, noble features, and graceful easy manners, he is undoubtedly far above the majority

of his fellow-zemindars, in personal appearance. In activity and mental energy, he is perhaps superior to many of the class; but in the daily routine of his zemindary, and in the treatment of his ryots, he is the true type of the Bengal landlord.

Chunder Roy's zemindary lies in the rich valley of the Ganges: his own family resting-place is on the banks of that sacred stream. His castle stands amidst lofty trees and spacious meadows, commanding a view far up and down the stream. Within a short ride of the district town of Luckypore, his mansion is well placed both for purposes of his own zemindary and for general business; for Luckypore is an important town, to which vast numbers of baboos resort for trading, and where the zemindar can turn the various produce of his land and his ryots to the best account: where he can dispose of the sweat of their brows at the highest price per *factory maund*, and obtain the utmost marketable value for every seer, maund, and beegah of their bones and sinews squeezed out in the shape of jute, hemp, linseed, cotton, indigo, and sugar, to say nothing of saltpetre and a few common dye-stuffs.

Viewed at some little distance, the castle and grounds of the zemindar wear a most imposing appearance. The building does not perhaps strike one as belonging to any particular order of house architecture, either eastern or western; but then it is extensive; there are large porticos, and no end of windows. The lofty trees, dotted about the grounds, give a park-like appearance to the place, while its general exterior is improved by the stately landing-place from the river-bank to the grounds, and the round white building, whatever it may chance to be, which abuts upon the river from one side of the ghât, with a flagstaff peering high above its walls, like a willow-wand against the deep azure of the sky.

The zemindar's grounds and house were planned by a first-rate English architect, and, if report speaks true, the work cost several lacs of rupees. Native-like, however, Chunder Roy could not persuade himself to abide by the Englishman's plans, and accordingly clipped the verandahs of their fair proportions, stuck in loopholes instead of windows, allowed the gravel-walks and terraces to become overgrown and ruinous, so that what wears a very magnificent exterior at a mile distant, becomes a sort of deserted palatial prison at a closer inspection.

In the round white house by the ghât with the flagstaff, our zemindar holds daily court, to hear complaints, to decide petty disputes between his ryots, and, above all, to arraign defaulting cultivators for their shortcomings. This is a terribly busy place at certain seasons of the year; many an aching desperate heart enters the narrow portal in the rear, some to return only after dreadful sufferings, some never, alive. In the dark, damp chambers beneath that terrible audience-room, more horrors are enacted than are dreamed of in Merrie England. Slaves of the soil, creatures of the zemindar, who from sickness or accident, or bad weather, or a dozen other causes, have disappointed his *lomashtia*, or bailiff, of the expected quantity of grain or other produce, are incarcerated within those loathsome walls, until, rendered desperate, they obtain liberty under some promise of impossible returns, which ends in imprisonment to death, or perhaps flight, or starvation, or suicide.

But amidst all this, the zemindar is a happy, prosperous man. He dresses in the most approved fashion, drives horses of the best breed, feeds on the dainties of the land, and is housed, if not in courtly style and comfort, according to western ideas, at any rate in eastern palatial splendour. His suites of rooms are most extensive, though they are rather dimly lit by poor wooden casements, and entered by low doorways; his furniture and fittings were once of the most costly description; now they are faded, tattered,

and patched with old tawdry relics of bygone splendour. One might well imagine his state-apartments to be the property-rooms of a third-rate London theatre. His own private rooms are small and filthy enough for any back-slums of old Edinburgh or ancient London, where the fresh air and the glorious light of day enter but through wooden traps and accidental slits in the wall, diluted with all kinds of effluvia and dimnesses. O the intolerable heat of that inner sanctuary of Chunder Roy! How tantalising the mimic punkabs, how aggravating the sight of the waving branches of huge green trees outside, bending gracefully to the noonday breeze!

As for his zenana, the rooms of the female portion of his family are never approached by man, unless he be a younger brother. What they are like, I once had an opportunity of judging during a very brief period when they were cleared out for some repairs. Rooms an Englishman would scarcely call them: cribs or dens for tame beasts would approach more nearly to their description. Furniture they have none. A few dowdy mats, some *resayas* or padded cotton quilts, a hookah or two, and a miserable, dimly burning lamp—these constitute the essentials of a Hindoo lady's apartment. I could not wonder the fever had compelled the zemindar to remove his family, and make some changes in the economy of his private rooms. The only marvel to my mind was that any member of the family had escaped the pestilence cooped up in those vile dungeons.

To behold our friend the zemindar cast off the daily dingy rag which scantily encircles his waist, don the ample flowing robes of white, the rich silken vest, the gay, many-folded head-dress, and sailly forth from the inmost recesses of his dusty, reeking crib, and spring into his carriage, surrounded by armed and many vested retainers—to behold this would appear almost as marvellous as Cinderella's transformation. Certainly Chunder Roy leaves behind him fully as much dirt as the young lady of the fairy tale.

The life of a zemindar in the mid districts of Bengal may fairly be set down as one of almost daily excitement. With as many cases to decide as any ordinary justice of the peace—with as many clients to see and converse with as a solicitor of fair reputation—with as many broils, lawsuits, and actual downright fights as an Irish tenant or an English blackleg, the Hindoo zemindar must necessarily lead a pretty active life, if he wishes to hold his own, to say nothing of holding his neighbour's, which, unfortunately, a considerable number of them have a national weakness for aiming at.

One day's work will suffice for a sample of most of the three hundred and odd days which—knocking off half of the Indian festivals—make up his year of business. A few disputes amongst his ryots about a brass totah, or somebody's wife, or a bullock, are soon disposed of; then come some land and tithe questions—terrible affairs in themselves, and still more so in their consequences, as the ryots find to their cost; then some question in which the government is mixed up has to be discussed, and the result is that 'Honourable John' is done, as completely as though he were a ryot.

It is rare, indeed, that a day passes without some plotting or scheming about land. This, indeed, is the great source of material wealth in India; and it is consequently the origin of half the lawsuits, and three-fourths of the assaults, affrays, and murders in Upper and Lower Bengal. A neighbouring indigo-planter, one of the Company's European 'interlopers,' has perhaps made advances to some villagers to cultivate indigo for him on their lands, bringing him the plant when ripe, to be manufactured into indigo, which is the most common method followed throughout India. The zemindar fancies or believes that these ryots and their

land own him as their lord and master, consequently that they must not toil for the planter though he should pay them double or treble the price obtainable from the zemindar. Here, then, is one most fertile source of deliberation and schemes. The growth of the enemy's plant has to be watched and reported upon; and as the time for culling and carrying it approaches, the zemindar has to prepare his *lattials* or fighting-men, to protect the party who are to remove this produce of the European foe.

The planter gets intelligence of what is going on, and he too musters his *lattials* in full force, armed not merely with sticks and clubs, but with spears, swords, and firearms. The mustering is not a mere matter of form: never were any men so desperately bent on mischief as the instigators of these *lattials*; never was life so ruthlessly flung away in acts of open daring as on these occasions. Neither the planter nor the zemindar appears in person, though on the day of strife they will be sure to be within sight of the skirmishing-ground. Perhaps the magistrate of the district hears of the intended breach of the peace, and despatches a strong party of armed *Burkemdazes* to repress the riot. But wo betide the police officials should they dare to shew their faces on the ground! The contending parties, forgetting their strife for the moment, unite in a common attack upon the general foe, who of course are quickly defeated, and leave the contending parties to fight it out. It is not easy to say why, but it is quite certain that on these occasions nine encounters out of ten end in favour of the European party, though perhaps inferior in numbers, and in no ways of a better class of *lattials*.

But the fight does not end with the field of indigo which occasioned it: the defeated party seeks revenge either by destroying other crops of his adversary, or by burning a village or two on his land. It matters not who suffers, provided it can in any way reach the enemy; and herein is the greatest evil of these affrays.

The Indian zemindar passes a considerable portion of his life in open or secret warfare with his species, like any other untamed beast of prey. With the government, with planters, with traders, with ryots, he is ever at strife. During the recent mutiny and rebellion, he has had ample scope for his belligerent qualities; and in many instances has not failed to avail himself of them. Where he has not done so, it has arisen from no inherent love of peace, order, or justice, but simply from the conviction which, in the breast of the Hindoo, is ever present, that 'discretion is the better part of valour.' Where numbers triumphed for the time, he has proved that, despite the press, the steam-engine, and the telegraph, India has not felt much internal social change. We have clipped the tiger's claws, but not washed out his spots.

AN UNCOMFORTABLE NIGHT.

'My dear Harry,' exclaimed my mother, as one winter's evening we all sat together in the library at Uplands—'My dear Harry, if you must positively yawn in that outrageous manner, I think your own room is the proper place to do it in.'

'Was I yawning?' said Harry, starting up from his nook near the fireplace. 'I beg everybody's pardon; but we had a long day after the cocks, as you know, Kenneth; and besides, the wind made such a noise in the trees near my window last night, that I positively did not close my eyes.'

Harry looked apologetically at our guest, Mr Brunton, a shrewd, sensible-looking man of about fifty years old, who glanced at him with a quaintly amused air as he spoke.

'Harry leaves to others the dignity of suffering in

silence, like Sancho Panza,' said my father. 'If you really are such a victim to want of rest, you had better take yourself off, and make up for lost time.'

'Harry was using the words in their conventional sense,' said Mr Brunton. 'If you had really ever known what it was to pass a night utterly without sleep, you would not think much of being kept awake or disturbed by a noise. The nearest approach to what the French call *une nuit blanche* that I ever passed, is marked by anything rather than a white stone in my memory.'

'What was it?' 'Where were you?' 'Do tell us about it?' we all said; headed by Harry, whom this attack on his fit of drowsiness had roused into full animation.

Before I let Mr Brunton tell his story, I had better explain who he is, and how it happens that we are all glad to listen when he speaks.

Mr Brunton is an old college-friend of my father's; and frequently visits us, partly in that capacity, and partly that my father, who farms his own estate of Uplands on an extensive scale, may profit by his valuable advice in many matters connected with modern scientific husbandry. Mr Brunton is an eminent agricultural chemist, and his services in this capacity are sought by many landed proprietors and large farmers throughout Great Britain. His skill is great in offering to nature the necessary compensation, in the shape of chemical compounds, strange to the eye and repulsive to the nose, for the drain upon her constitution which is required to produce the abundant grain and root crops expected by 'high farmers' as the reward of their expenditure of skill and capital; and in this useful branch of modern science, Mr Brunton has few, if any rivals.

But his active and enlightened mind is not satisfied to work only in this, its legitimate field of action; he has considerable skill in many kindred sciences, and has dabbled in most of the 'ologies'; and, above all, he possesses from nature the valuable gift of making his mental resources available in an easy and pleasant manner, for the amusement and instruction of others. It would be difficult to find a more agreeable companion; and accordingly, whenever he makes his appearance at Uplands, the entrance of the gentlemen into the library after dinner is the signal for us all to take up our station near the lamp, beside the fire, or in the shady nooks between the chimney-piece and the book-cases on each side of it, and prepare for a long pleasant evening of amusing conversation.

It was this, the family custom of some years' standing, which drew so much attention to Harry's unbecoming state of drowsiness; and caused a general flutter in the party, when Mr Brunton, in reply to our inquiries, promised to give us an account of the most uncomfortable night he ever had passed.

The fire was stirred, the moderator-lamp wound up; my mother's spectacles were rescued from impending destruction, and dexterously fished from under the table by little Marion, and we all declared ourselves ready to listen. Mr Brunton began thus:

It is about ten years, since I was proceeding from London to Glasgow, to attend a meeting there of the Highland Agricultural Society; and by some stupid oversight of my own, or mistake of the railway authorities, found myself sent off the main line, and rapidly approaching Liverpool, before I discovered the error. It was late and dark, and I have a particular objection to any unnecessary degree of discomfort; therefore, as there would still be time enough

for me to reach Glasgow before the opening of the meeting, if I took a forenoon train the next day from Liverpool, I resolved to profit by the accident, to visit an old acquaintance of mine who resided in one of the suburbs of the city, and from whom I had frequently received, and as often been obliged to decline, a warmly hospitable invitation.

I knew his house was not large, and his establishment I presumed to be on a strictly bachelor scale; but having lived a good deal about the world for many years, I can accommodate myself with ease to any circumstances into which I find myself thrown; and I own that I thought more of the pleasure of seeing and conversing with my old friend, than of the slight disturbance which my unexpected arrival might cause in his household. On arriving at the station, therefore, I engaged a fly, and set out at once for Dr Blackburn's house. 'The way was long, and dark, and dreary'—if Miss Rosie will forgive me a parody on her favourite poet—we rattled through innumerable streets, and wandered along a devious course in a wilderness of 'semi-detached dwellings' and 'suburban villas,' which seemed to have no end. At length we reached a small, but substantial house, standing somewhat back from the high road in a garden, which was surrounded by a high brick-wall; and on sending in my card, Dr Blackburn at once appeared at the entrance-door, with a hearty greeting, and a warm invitation to me to enter. The first few minutes were occupied by my explanation of the circumstances which led to my unexpected intrusion; and it was not till my portmanteau was deposited in the hall, and the flyman had driven away, that Dr Blackburn's old servant was able, after sundry mysterious winks and nudges, to attract his master's attention, and draw him to one side.

After a few words spoken in a low tone, Blackburn turned to me with a laugh, in which, however, there was a shade of embarrassment. 'Why, Brunton,' he said, 'here is Stevens reminding me, with a face of horror, that there is positively not a vacant corner in the house. There is a trial for poisoning, of great professional interest, going on at the assizes, and A—and G—, whom you must remember, are staying with me to attend it, and they occupy the only two spare rooms which the house contains'—I interrupted him by saying that it was of no consequence, I would spend the evening with him, and return to the railway hotel for the night. 'Impossible,' he exclaimed. 'You are fully two miles from the station; and how could you convey your *impedimenta*? We are far beyond the region of perpetual cabs here. No, no; we shall manage a shake-down for you; though I shall not be able to make you as comfortable as I should like to see a friend whom I have so long wished to have under my roof.'

A few instructions in a stage-aside to Stevens—in which I heard the words 'camp-bed,' 'a large tub,' and 'laboratory'—and Blackburn turned, and ushered me into the large, low, but comfortable and well-lighted dining-room, where his two guests were still sitting at the table. A portion of the well-cooked dinner was soon heated and set before me, and we sat conversing on many subjects of interest to us all, till a late hour. When we rose to separate for the night, Blackburn recommenced a series of apologies for the rough lodging he was obliged to give me, which I with difficulty cut short by assuring him of my indifference on the subject. He then took a lantern from the servant, and opening a side-door, led the way across a paved yard surrounded by outhouses, and through a small shrubbery beyond, to a detached building; which, from having been an apple-room or some dependency of the garden, he had converted into a laboratory and museum. He unlocked the door with a key which he carried in his hand, and we entered a

good-sized room, the walls of which were hung all round with curtains of green stuff, concealing shelves loaded with various chemical preparations and studies in anatomy and natural history.

Blackburn was a retired physician of considerable local celebrity; but being in independent circumstances, he had for some time relinquished the duties of his profession, and devoted himself to the sciences that are more immediately in connection with it. Chemistry and anatomy had led him on to mineralogy and geology; and entering warmly into the controversy excited in the scientific world about that time by the appearance of a very remarkable work on the last-named science, he had been devoting his leisure for some months before the time I am now speaking of, to the composition of a pamphlet, to be entitled *Comparative Anatomy in the Paleozoic Ages*, which was to give the world some ideas of his own on the subject. It was thus he accounted to me for various uncouth forms, models in miniature of the gigantic plesiosauri and pterodactyles of geology, which dangled from the ceiling, and cast grotesque shadows on the white-washed upper part of the walls. A large table had been hastily cleared to receive my dressing apparatus; and Blackburn handled with something of regretful tenderness a number of human skulls, collected to furnish evidence in support of some theory regarding the origin of the varieties in the human race, which had been disrespectfully cast by Stevens, in the course of his hospitable preparations for my comfort, into a corner of the room, where they lay grinning upon a heap of other bones, both fossil and recent, which were awaiting the collector's leisure to be classified and arranged in order on the shelves. We fell into conversation on the subjects suggested by these evidences of my friend's favourite studies, and some time elapsed before he left me for the night, promising to send his servant to call me at an early hour in the morning.

I locked the door as soon as my friend retired, and then made a fresh examination of the somewhat singular apartment which had been hastily prepared for my reception: and in order to make what I am going to relate more intelligible, I will describe the room as it then appeared to me. It was nearly square, and, as I have said before, of considerable size. One of the sides was formed by the high brick-wall of which I have spoken as surrounding my friend's house; and from this wall, which may have been about fifteen feet high, the roof sloped gradually, till, at the opposite side of the apartment, the space between the roof and the floor was not more than nine feet. The room was not ceiled, but the rafters and beams were whitewashed, as well as the space left at each end between the green curtains which covered the walls all round, and came close to the roof, where it was lowest, and the gradually increasing height of the walls. The door was in the centre of one end of the room; opposite to it was a large open chimney, with a raised slab of stone supporting dogs for burning wood, on which was now heaped a brightly glowing pile. At one side of this cheerful fireplace stood a large tin-bath full of water; and on the other, a small camp-bed was spread with the freshest and whitest of linen. My portmanteau, and the table spread with my dressing-apparatus, occupied a third corner; and the fourth contained the heap of bones and skulls already mentioned. A large leather-covered arm-chair, and an old-fashioned spider-legged table before the fire, completed the furniture. After making my preparations for the night, the fire looked so temptingly cheerful, that, my mind being occupied with the subjects we had discussed during the evening, I could not resist seating myself in the arm-chair, and indulging in a little half-drowsy meditation. By and bye, however, the atmosphere of the room became rather oppressive; the fire, heaped up by hospitable hands, gradually drew from the bones and

other animal products in the surrounding shelves, odours which were neither pleasant nor healthful; and remembering that I had not seen a window in my first survey of the room, I rose to look for it. Under the green curtains, on the side opposite to my bed, I discovered two square windows, such as are often seen in stables, opening outwardly from the top, and kept from slipping by a curved bar of iron cut into notches. I opened one of these to its utmost stretch, and, after looking for a few minutes at the brilliant sky of a frosty autumn night, closed the curtain again, and betook myself to the camp-bed.

I lay for some time watching the wildly grotesque forms assumed by the shadows of the antediluvian monsters I mentioned as dangling from the rafters, while the embers flashed and grew dull, and again brightened into a transient blaze; and sleep was gradually stealing over me, when I was startled by a slight sound, as though something had fallen from one of the shelves. I raised my head and looked round, but could see nothing; and my eyes were closing again, when suddenly it appeared to me as though a hideous face were painted on the very spot at which I was looking. It was visible but for a moment, and then vanished. I rubbed my eyes and shook my head, and even felt my pulse to try and detect some symptom of incipient fever; but except that I plead guilty to one bounding throb, there was no sign of any abnormal state of the circulation; and I was trying to fancy that I had been gazing at the skulls in the corner, and transferred the image of one of them to the next object on which I fixed my eyes, when the appearance returned in the same spot.

This time there could be no mistake: I clearly saw the flashing eyes, the glittering teeth, the frightful grin of a demoniac countenance. A bright blaze shot from the expiring embers, and in a second the vision disappeared. I own that now a cold sweat burst out from every pore. Either I was seized with sudden insanity, or I was the victim of some supernatural delusion. I lay for a few minutes a prey to the horrible sensations of one struggling with the nightmare. I would have given the world to have risen, and endeavoured to discover some natural cause for the frightful appearance; but my good-fortune, or, let me say more reverently, the watchful mercy of a kind Providence, kept me still.

I could almost hear the beating of my heart in the profound silence. Gradually the light faded, the embers crackled more faintly, the shadows flickered and disappeared in the general gloom; but still I lay motionless, my eyes riveted on the spot so full of mystery. I should think that at least a quarter of an hour passed in this manner.

Then the curtains waved, parted; a bright beam of moonlight fell on the floor, and, directly intercepting its rays, stood a frightful figure—the satyr of heathen mythology, the origin of our Christian superstitious portraiture of the arch-enemy, a huge living specimen of that strongest and fiercest of the ape tribe, the *Simia satyrus*, or wild man of the woods. This, then, explained the mystery. The creature must have escaped from some menagerie, and found its way in by the open window, and, with the cunning of its race, had concealed itself till the growing darkness gave it increased boldness.

I knew enough of the animal's wicked and malignant nature to feel convinced that my only chance of safety lay in eluding its observation; while, therefore, it stood at the further end of the room, still grasping the curtain, and surveying its new quarters with a horribly grotesque curiosity, I endeavoured to draw the sheet quietly before my face; but my slight movement at once arrested the creature's suspicious glance, and, with a single bound, it squatted itself, grinning and gnashing its teeth, on the foot of my bed.

I now gave myself up for lost, and endeavoured to prepare for a horrible death by summoning to my aid all the support of religion. While I strove to fix my thoughts on the subjects which should occupy the mind of man in his last extremity, I fixed my eyes with the fascination of terror on my fearful companion; and to my inexpressible relief and thankfulness, I found that he grew restless and uneasy under my steady gaze, and turned his head in another direction. All at once flashed into my mind the stories I had read, and only half believed, of the power of the human eye over the brute creation, and I redoubled the intensity of my stare, looking fixedly into the creature's eyes. It grinned and jabbered, and moved its arms about restlessly; and, mindful of my only remaining chance, in the event of its springing towards me, I got my hands quietly under the bed-clothes, resolved to make an effort to throw them over its head before it could seize me in a gripe which, I well knew, would not relax till it left me a mangled corpse.

Gradually, however, the creature drooped its hideous head on its breast, and was on the point of falling asleep, when a brand from the nearly extinct fire fell with a slight noise, and roused it again to full activity. The flame which suddenly leaped up, for a moment diverted the attention of my jailer; and the uncouth creature rose from its squatting position on my bed, and approached the fire, holding out its mis-shapen hands, and covering over the warmth with a horrible resemblance to human action.

I now resolved to slip, if possible, unseen from my bed, and either gain the door, or, if I could do no more, conceal myself between the bed and the wall, and trust to the brute's forgetting my presence. When I attempted to move, however, I found my right foot, which had been under the creature as it sat on the bed, was so completely numbed or twisted as to be altogether useless; and the attempt to move only served to draw on me the wrathful notice of my enemy. Uttering a kind of hissing sound between its teeth, it darted to the further corner of the room, and seizing a large bone from the heap that lay there, again took up its quarters on the bed, and threatened to strike me with the bone in a manner evidently copied from that to which it was accustomed from its keeper.

Thus situated, I had no alternative but to trust again to the power of the eye. The fire had now died completely out, and one white ray of moonlight fell, through an opening in the curtain, right upon the creature's hideous face. I fixed my gaze upon it till I began to feel a strange effect produced upon myself: first the grotesque mask seemed to approach nearer and nearer, till it appeared as if it were about to touch me; and then, while everything grew dark around it, it seemed to shine with a pale ghastly light, as if seen far off, at the end of an immeasurable cave. I felt all the sensations which I have heard described by persons who have been mesmerised, and I have no doubt that my nerves, highly wrought upon and excited as they were by the circumstances in which I was placed, were peculiarly sensitive to the subtle influence. As the thought crossed my mind, together with the dread of becoming insensible, and thus being completely at the creature's mercy, I made an involuntary movement, as if to free myself from the spell.

The fierce brute aimed a sudden and violent blow at me with the bone which it still held in its grasp. Mechanically, I moved my head to elude the stroke, the full force of which was thus spent on the pillow, or I should probably then and there have ended my earthly career. As it was, the bone glanced off the corner of my temple. I felt an acute pain, a gush of warm blood down my cheek and throat, and for a few moments I became insensible.

The instinct of self-preservation restored me to

life. I seemed almost by force to recall my scattered senses; and the room being now perfectly dark, I succeeded by slow degrees in gliding from the bed to the floor, while my tormentor, apparently satisfied with the revenge it had taken, curled itself up in the very place I had just quitted, and slept—at least so I conjectured from the cessation of its restless movements, and now and then a heavy grunt, or snort, which bore a humiliating likeness to a human snore.

The hours which followed were among the longest I ever remember to have passed. In slipping from my bed, I had so entangled myself with the sheet, that I found it would be impossible to move without disturbing my horrible neighbour: the wound in my temple smarted, and my head ached severely, and I could not repress an occasional shudder, half of cold, and half of nervous excitement, which ran through me like a convulsion. Every time this occurred, I expected my enemy to wake; but the long, dark, weary hours dragged on, and he still appeared wrapped in slumber.

At length, with joy and thankfulness which I will not attempt to describe, I perceived a faint light, like a gray mist, steal over the black darkness around me. It was near the end of October, and I remembered that the sun did not rise much before seven o'clock—consequently, that it was probably now not far from six, and I might reasonably expect before long to be released from a situation which was all but intolerable.

I was summoning my best energies to my aid, and considering what means I could adopt to get the door open before I should be overpowered by the creature, which I felt sure would spring at me as soon as I moved, when I heard voices in the garden, and in another moment some one loudly knocked at the door, and implored me to open, for God's sake, if I was alive.

The creature started up at the sound, made one furious rush at the opening of the curtain, which now let in a streak of decided daylight; and at the same moment the crash of broken glass, and a succession of wild piercing cries announced that it had missed its leap, and fallen into the hands of its captors. I confess that at this moment of release from the horrible fate which had been impending over me for so many hours, I felt my strength of mind and body at once give way, and became completely insensible.

When I revived, I found myself stretched on the bed, the chill morning air blowing in from the open doorway—the door having been wrenched from its hinges—and poor Blackburn, with a face of the deepest anxiety, bending over me with some powerful stimulant. 'Oh, thank God, thank God!' he exclaimed, as I endeavoured to rise and speak to him. 'Keep quiet, my dear fellow; do not move or speak; only look at me, if you are in your senses.' In a few minutes, I could not only look, but speak, and assure him that I was practically but little the worse for the unpleasant night I had passed; but he would scarcely listen to me, and kept on repeating: 'The satyrus! the wild man of the woods! the most fierce and relentless of animals!—how can you have escaped with life?'

'I thank God that it is so,' I replied earnestly; 'for truly it has been only the hand of His protection that has guarded me. But where did the creature come from, and how did you discover that it had paid me a visit?'

'Oh, that is the worst of all,' said poor Blackburn. 'It was through my abominable carelessness that the accident occurred: and if anything had befallen you, I never could have forgiven myself. It is bad enough as it is.'

'But has the beast escaped from a menagerie, or how did it come here?'

'It is mine,' said Blackburn ruefully. 'The captain of a merchant-ship, knowing my turn for natural

history, and that I have a small collection in the garden here, gave me the brute a few days ago. I had him chained in an empty stable; and last night, after shewing him to A—and G—, I must have missed the lock of the door, and turned the key without shutting it. The man who feeds and attends to my animals came as usual about six o'clock this morning; and finding the stable empty, at once gave the alarm. We traced his footsteps across the mould of the garden, to the window of this room, which to our consternation we found open. You may fancy to what a pitch my fears increased, when on knocking at the door the fierce brute flew out of the window, and, catching its foot on the iron stanchion, fell to the ground. It was overpowered, not without some ugly bites and scratches; and we then forced open the door of this room, fully prepared to find your mangled body. Nothing was to be seen but the empty bed, and a large stain of blood on the pillow; but we soon found you, insensible, and as I at first thought dead; though a little examination sufficed to shew that you had received no mortal injury. I cannot express my thankfulness. But your escape is a perfect marvel to me; and as soon as you are rested and refreshed, you must give me an account of what happened.'

Before long, I was seated at a cheerful breakfast-table, and making up as best I could for the wear and tear of my constitution during the last few hours. By the time I reached Glasgow, there remained little outward trace of my night's adventure, except a very disreputable black eye, which, for my character's sake, I was forced to cover with a patch; but I will own that many nights elapsed before my sleep ceased to be disturbed with frightful visions, or I could get rid of the sight of a grinning, fiendish face, which always started out of the darkness when I closed my eyes. Indeed, to this day I do not think I ever hear mention made of Liverpool without remembering the very uncomfortable night I passed, in my first and last visit there, more than ten years ago.

PROGRESS OF CO-OPERATION.

THEORETICALLY, the mode in which we are supplied with food and other articles of necessity and comfort is faultless. Private individuals, without any view to the convenience of the public, but actuated solely by interested motives, undertake the supply of the articles in constant demand; merely adding to the cost-price the remuneration they demand for their trouble, and a fair proportion of the expense they are at, in shops, assistants, &c., in conducting their business. These individuals being numerous, act as a check upon each other; for their competition must necessarily be in excellence of quality, in moderation of price, in all things that can make services of the kind acceptable; and so the public are supplied with the best of everything at the lowest price, and with no more trouble than that of selecting their tradesmen.

This is the theoretical view of the subject: the practical one is a little different. We find in practice that the competition is not in regard to realities but appearances; and when this is the case, of course the palm is achieved by those who can deceive best. The gracious public must be made to imagine that they obtain a good article at a low price; and as these two things are incompatible, the article must be so skillfully adulterated as to seem good while it can be profitably sold cheap. Whether this is the fault of the dealers or the public is of no consequence: the fact stands all the same, and it throws discredit upon the whole competitive system.

Another system, our readers are aware, has been tried by various bodies of the working-classes—a system in which the motive-power is co-operation instead of competition; and there is now before us a paper which was partially read before the Social Science meeting at Birmingham, giving the results of the experiments of two of these co-operative bodies.*

One of these, the People's Co-operative Flour-mill, we described at large on a former occasion.† We mentioned that the proximate cause of its establishment at Leeds in 1847 was the high price of flour and its excessive adulteration; the millers combining to keep up the price of their manufacture without regard to the rises and falls of grain in the market. Under these circumstances, the working-classes of the locality determined, at a public meeting, to purchase and manufacture for themselves, and thus to obtain 'pure flour at as near prime cost as possible.' It is interesting to observe the course of the experiment since then, which in fact has been so uniformly and triumphantly successful as to go a great way of itself in demonstrating the soundness of the principle. The shares were at first a guinea each, but were afterwards raised to nearly fifty shillings. The flour was sold at first at cost-price, but a profit is now added; the advantages were at first confined to the members, but the public is now admitted to share; the business for the first five years never exceeded L.27,000 in the year, and has since then increased to L.72,000.

The existing trade could not stand unmoved before this new competitor. The price of flour was reduced, and adulteration, before excessive, became unknown in Leeds. In order to judge of the price of so fluctuating an article, this rule will suffice: that when grain is sold at so many shillings per quarter, flour will remunerate at the same number of half-pence per stone of fourteen pounds. Thus, when corn is 60s. per quarter, flour can be sold with a profit at sixty half-pence, or half-a-crown per stone. When the Society's flour was sold at about cost-price, it was still 1½d. below the reduced market-price, and saved the purchasers L.2000 a year. Even now, when it is sold at a remunerating price, governed by the markets, it is never above the half-penny per stone to the shilling per quarter, but often below that rate.

The following are the general results of this interesting experiment as given in the pamphlet in an address to the members:

'1st. Flour was abominably adulterated in Leeds before we began, and you know we have been supplied with a perfectly pure article from our mill, no adulteration being ever permitted.

'2d. You know that the price of flour often bore no natural ratio to the price of corn, but that dealers advanced the price of flour at their pleasure; and you know that since our operations we have steadied the markets, and reduced the scale-charge for flour at least 1½d. to 2d. per stone below the millers' previous charges.

'3d. You know that the original members never paid more than 21s. each, so that 3270 members' subscriptions would come to L.3433, 10s.; and you know that you have withdrawn bonuses to the amount of L.5987, 11s. 8d., or L.2508, 10s. 8d. more than was ever paid in; and your directors now hereby declare to you, that by valuation of mill, fixtures, and stock,

up to July 1, 1857, your capital amounts to the sum of L.9083, 6s. 8d. above the said bonuses.'

The other experiment of the kind has been tried at Rochdale, and with a result quite as satisfactory. It commenced in 1844, from the same causes, and with the same object, as the one at Leeds; but here it began with groceries, and extended *seriatim* to butcher's meat, flour, coal and potatoes, clothing, drapery, shoes, clogs, hats, &c. 'Wages being generally paid at Rochdale on Friday and Saturday evenings about seven o'clock, it is a perfect wonder to see the numbers of well-dressed working-men and their wives walking quietly into the grocers' shops, where, beginning at the left-hand counter in No. 1 department, they are supplied with goods, pay, get their tickets representing the money, and then move on to No. 2, and so on to the eighth or ninth shopman; then into the butcher's shop, the flour, the potato, and the clothing rooms. On Friday, the 27th September, at half-past seven in the evening, I stood and counted sixty-five people in the grocery store, twelve in the meat and flour, and five or six in the clothing shops; and I was informed they have sometimes more than one hundred people purchasing at one time, who take their turns in the order of attendance. The purchases average fifteen to sixteen shillings per week per member, clothing being about one to twelve in amount, as compared to food.'

From the net profits of this Society—called the Rochdale Pioneers' Co-operative Store—2½ per cent. is set aside for the means of intellectual improvement. They have a library of 1600 or 1700 volumes, free to the members, and a news-room partially free. They have purchased a considerable part of the property they occupy. They make no display in their shop-windows, spend nothing in advertising, buy and sell for ready money, and instead of being in want of funds, have more than they know what to do with.

In 1844, the amount of the society's funds was L.28; in 1856, it had increased to L.13,000. In 1845, the business done was L.710; in 1856, it was L.68,197. In 1845, the profit was L.38; and in 1856, it was L.3922, or 35 per cent. on the capital.

The advantages of the co-operative system are numerous. It gives its members better goods for their money, because, instead of having any inducement to adulterate, or manufacture superficially, its interest is quite the other way. Its customers being ready, waiting for supply, there is no risk of overstocking; it has no need, therefore, of publishing that it will get rid of its winter goods at any sacrifice to make room for its spring stock; and being under no necessity of laying baits for patrons, it spends nothing in plate glass, gilding, chandeliers, or puffing advertisements. Dealing for ready money, it has no bad debts, and no law expenses. 'All who know intimately,' says the pamphlet, 'the habits of the working-classes, know what a fearful evil the practice is of purchasing their food and clothing on credit. Once tied fast to the shopkeeper, then follows, as a rule, high prices for bad articles; the food is adulterated, and the clothing inferior; poverty is thus made poorer, and to debt is often added law, and pauperism naturally follows, a canker and a curse. What, then, must be the benefits of a complete change of the habit of credit? known well by the poor to be so great an evil, and yet felt to be so hard to get rid of when once formed. And yet this change has been effected by these societies. The transactions of the managers of the Leeds and Rochdale societies are all, both buying and selling, on ready-money principles. As a consequence, those who were never out of debt, who crouched to the shopkeeper, and dreaded the bailiff, are now fearless and clear of all incumbrance: they are consequently independent, and feel morally as well as socially elevated. Able to lay out their money to the best advantage, their houses become better furnished, and cleaner; their food is

* *The Economic and Moral Advantages of Co-operation in the Provision of Food, instanced in the People's Flour-mill Society at Leeds, and in the Rochdale Co-operative Pioneers' Store.* Leeds: Green.

† See *Journal*, No. 51, for December 1854.

more plentiful, and more wholesome; education for the children, and all other moral benefits follow: to visit the Green Board becomes now almost impossible; and not a few have a deposit at the bank, their own savings, upon which they may fall back in case of need. To enter the Society induces saving, and the savings thus accumulated, by the very condition of mind leading thereto, prevents their being wasted away in either drink or dissipation—those sad, sore evils which swallow up so much of the hard earnings of the operative.

What is to prevent the working-classes throughout the kingdom from following the example of these two societies? Ignorance. Even at Leeds, with the advantage of the flour-mill before their eyes, and its handsome dividends in their pockets, a grocery store commenced with their own consent is on the point of failure from sheer want of custom! In our former paper we gave the complaint of the managers touching the supineness of their fellow-workmen in refusing to sanction the establishment of grocery and meat stores, instead of pocketing the bonus of the flour-mill—insignificant, of course, to each. It appears, however, that their sanction was at length obtained; that a grocery store was actually commenced, and that it does not pay, in consequence of its proprietors, the working-classes, with comparatively few exceptions, refusing to deal at their own store, and thus obtain better and cheaper goods, and a money-profit besides. The pamphlet is silent as to the cause of what might seem, without explanation, a very extraordinary mental blindness; but the probability is, that it merely offers one more illustration of the misery of the credit system—that the people are tied to the grocers, and cannot readily get away. Whether this is the fact or not, the Rochdale men would seem at first sight to be greatly in advance of those of Leeds in point of intelligence, either in keeping out of debt, and so securing to themselves the power to act as they please, or in choosing, from two courses before them, the one that obviously leads to advantage. It is difficult, however, to reason on the case without better information than we possess on the circumstances of the two towns.

Upon the whole, the experiments we have thus glanced over prove, in the first place, that contrary to the commonly expressed opinion, it is perfectly possible for men of the working-classes to conduct their own business, even when of a complicated nature, to a successful issue; but, in the second place, that the body is not generally so far advanced as this in intelligence. Their own best friends take the unfavourable view of their character, and without always giving them the credit of the *per contra*.

'I have worked with the working-classes,' said Mr Charles Bray at Birmingham, 'at all measures for improving their condition for a quarter of a century, but have never yet found them capable of conducting their own affairs. If their affairs were of a trading kind, they were jealous and niggardly of the pay of those who were principally instrumental in making them succeed, and what was ordered by a committee one week or month, was too frequently undone the next. There was no permanency or persistency. If their affairs were of other kinds, they fell out among themselves, and could not long be kept together. The worst feature of ignorance is intolerance, and the worst of the working-classes is that they cannot agree to differ.' This is from a note to the pamphlet, and in the text the same thing is repeated. 'Many object to work out their own social elevation, preferring poverty to independence; and thousands act so as to be a dead log upon the more thoughtful and prudent. Others who wish to get out of the trammels of poverty, ignorant of the natural relations of things, hope for the impossible, and not getting their wishes, become discontented with real benefits, and quarrel therewith.' The two

societies we have described, however, shew what *can* be done, and with such examples before us, it would be folly to despair.

ELEGANT EXTRACTS.

NEXT, we believe, to *Captain Toot's Voyages*—for thus our infant tongue pronounced the name of that great navigator—not very much below the illustrated edition of *Tiger-hunting in India in the Eighteenth Century*, and at no immeasurable distance from *Robinson Crusoe* himself, we were wont, in our early boyhood, to hold in favour the *Elegant Extracts*. They consisted of four enormous volumes, one of which was denominated 'Epistles,' one 'Prose,' one 'Verse,' and one 'Poetry;' but these two last were absolutely identical, duplicates, and, like some twins who are only distinguishable by the variation of a strawberry-mark between their shoulders, differed in nothing save in the name at the back of their bindings.

We are at this time residing for a little time among the scenes of that far-back, thoughtless epoch of youth, which has long since become sacred and solemn enough to us, and we have found the same old volumes as interesting—though we ourselves have suffered such change—as ever. Much of this interest, indeed, arises from the comparison—involuntary, and yet the most odious of all comparisons—of our two selves—between Philip drunk with youth, and Philip sobered with all the cares of a *Paterfamilias*; but the books have got much intrinsic treasure of their own, which no time can rust. We confess to never having had any great fondness for the volume of *Epistles*, although we always identified ourselves so fully with the young gentleman in knee-breeches and a ruffled shirt, whose attention is being directed, in the frontispiece, by the muse of epistolary correspondence, to the effigy of Lord Bacon: she cannot, at least, be the muse of history, or she would not be setting him up for a model. Much of our dislike may be, we fancy, attributed to our having been made to retranslate Mr Melmoth's letters to *Papirius Pætus* into Latin, such as M. T. Cicero would have been astonished to have found his own.

This volume is divided into five books, the last of which is appropriated to 'Recent Letters,' which begin with those of William Shenstone, Esq., and end with those of Mr Edward Gibbon—by this time, alas! seeming hardly to be more 'recent' than those in the first book by Mr Pliny the Consul to several of his friends. 'The Prose,' as a deceased wit, who was scarcely born when these volumes were first published, has observed, 'was even worse.' Moral and Religious, Classical and Historical Prose, Orations, Sermons, and (especially) Characters of Departed Sovereigns. Character of Charles I., by Macaulay, Character of James II., *ibid*. How strange these titles read to us, and yet how familiar! The female historian only lives in *Elegant Extracts* such as these, and another Macaulay reigneth in her stead, who has drawn for us the same characters with a far more skilful touch, though with not less violent colouring. Among the slightly verbose accounts treating of 'The affected strangeness of some men of quality,' or of 'A citizen's family setting out for Brighthelmston,' there are a number of pieces which were wont to give us the most unmixed delight. How fond we grew of the little Nurse Glumdalclitch, who was but forty feet high; and of the mighty king who was, by the breadth of a finger-nail, taller than the tallest of his court! But then were *Broddingnag* and *Lilliput* but pleasant fairy tales, which have now become wicked satires; whereas, upon the other hand, that pious and exemplary 'Explanation of the Fifth Commandment,' by Corporal Trim, used somewhat to shock the well-regulated mind of our young days as being slightly blasphemous. What a charming woodcut heralded this volume also! A bee-

hive amongst hollyhocks, with a young man in pursuit of a butterfly; which by some allegorical means, untranslatable by us now as then, conveyed a high moral lesson.

But by far the favourite with us of these great books, was that one which was devoted to the muse: 'The useful and entertaining pieces of poetry selected for the improvement of young persons.' Some of these, indeed, culled from the flowery gardens of Dean Swift and others, would in these days be considered by no means elevating for youth. It is more than half a century ago since the *Elegant Extracts* were published; not a single one of our now living writers was famous enough at that period to gain admittance into these pages. The Nestor Rogers, who has so lately succumbed, after that unprecedented combat of his with devouring Time, is quoted as an accomplished and promising young poet; but of Wordsworth, Coleridge, and Southey, of Shelley, and Keats, and Tennyson, there is nothing chronicled. How strange it seems! What revolutions, improvements, reverses, has literature undergone 'since this old book was new!' What glorious poetic fire has touched our souls, which was lying then unkindled and undreamed of in infant breasts! What wit! what wisdom! Here is a Pastoral Ballad, by one Byron, it is true; but even that is a misprint for Byrom. How very much we should like to see a pastoral ballad from the pen of him who wrote the *Giaour* and *Don Juan*! Here, however, is a song by Moore:

How blessed has my time been, what joys have I known,
Since wedlock's soft bondage made Jesse mine own!
So joyful my heart is, so easy my chain,
That freedom is tasteless, and roving a pain.

Through walks grown with woodbines as often we stray,
Around us our boys and girls frolic and play,
How pleasing their sport is the wanton ones see,
And borrow their looks from my Jesse and me.

To try her sweet temper sometimes am I seen
In revels all day with the nymphs of the green;
Though painful my absence, my doubts she beguiles,
And meets me at night with complance and smiles.

What though on her cheeks the rose loses its hue,
Her wit and good-humour bloom all the year through;
Time still, as he flies, adds increase to her truth,
And gives to her mind what he steals from her youth.

Ye shepherds so gay, who make love to ensnare,
And cheat with false vows the too credulous fair,
In search of true pleasure how vainly you roam;
To hold it for life you must find it at home!

This, of course, cannot be our unmoralising Irish Thomas, and yet there is something in the ring of the metre which resembles him; and still less, although the sentiments above expressed are worthy of her, can it be Mrs Hannah More of sacred fame. Who was then Moore, the elder? Who, again, was this Rev. Mr Maurice, whose poem of 'The Schoolboy,' written at a very early age,* we are here favoured with? Not, surely, the rejected of King's College, the ardent and able theological writer of our day. Who was 'the great essayist, Thornton?' Who was Jago (*sic*) who writes this very clever 'Imitation of Hamlet's Soliloquy'?

To print or not to print—that is the question.
Whether 'tis better in a trunk to bury
The quirks and crotchets of outrageous fancy,
Or send a well-wrote copy to the press,
And, by disclosing, end them?

To print, to beam
From the same shelf with Pope, in calf well bound;
To sleep, perchance, with Quarles—ay, there's the rub—
There's the respect that makes
Th' unwilling poet keep his piece nine years.

For who would bear th' impatient thirst of fame,
The pride of conscious merit, and, 'bove all,
The tedious importunity of friends,

But that the tread of steep Parnassus' hill
(That undiscovered country, with whose bays
Few travellers return) puzzles the will,
And makes us rather bear to live unknown,
Than run the hazard to be known and damned?

Who was Mrs Smith, who publishes these heavy sonnets 'To Night' and 'To Tranquillity,' with many others addressed to similar unsubstantial objects? Tranquilly enough, she has herself sunk into the night of forgetfulness, and Mrs Smith on Mrs Smith, like wave on wave, has overwhelmed her memory.* Who was the once celebrated Mr Thomas Knox, who, in the immediate neighbourhood of Churchill and Campbell, we find with his blank verses, 'Spoken at the Annual Visitation of Tunbridge School?' They begin with, 'Sweet is thy month, O Maia,' and extend over some three hundred lines, with an invocation to 'the Pious Judd,' about midway. Who was the pious Judd? By no means, we daresay, an individual to be sneezed or laughed at; and yet we cannot help smiling at his unknown but doubtless venerable name. Our youthful mind was wont to associate Mr Thomas Knox with the eminent Scotch Reformer of that name; but the keener intellect of our maturity tracks him to the preface, whereby we discover him to be the editor himself of these *Elegant Extracts*, where, by taking advantage of his position, he has cunningly preserved himself in amber along with the best of them.

How good, though somewhat coarse, were the old satirical verses which we look in vain for now! Some, by Mr Soame Jenyns, upon 'the modern fine gentleman' of exactly a hundred years ago, have the following finish:

He wagers on his own and others' lives,
Till Death at length, indignant to be made
The daily subject of his sport and trade,
Veils with his sable hand the wretch's eyes,
And, groaning for the bets he loses by't, he dies.

What a comfortable reflection it is to think that there is no speculation of this sort now-a-days! How thankful, in these virtuous times, ought waning rectors and annuitants with loving relatives, to feel!

In the poems 'Sentimental, Lyrical, and Ludicrous,' which was wont to be our favourite portion of this volume, it is remarkable how very long most of the headings are; the verses themselves do not occupy a larger space than the arguments; and the arguments are often, one would imagine, as much unsuited as possible to the muse.

'Ode on the Death of Matzel, a Favourite Bullfinch, addressed to Philip Stanhope, Esq. (natural son to the Earl of Chesterfield), to whom the Author had given the Reversion of it when he left Dresden.'

Again: 'Presented, together with a Knife, by the Rev. Samuel Bishop, Head-master of Merchant Taylor's School, to his Wife on her Wedding-day, which happened to be her Birthday and New-year's Day.'

And, 'Written on the Occasion of a Ball, in which the Ladies agreed to dress in Silks, for the Sake of encouraging the Spitalfields Manufacturers.'

The sight of 'the Lady Elizabeth Thynne cutting trees on paper,' seems to have been too much for the poet Waller to view, and be dumb; while Grainger recommends his 'Bryan and Pereene, a West Indian ballad,' upon the ground—and perhaps he knew that there was no more intrinsic attraction in it—of

* It is, no doubt, the multitudinous name that puzzles our friend: Charlotte Smith is well known to this day among a very numerous and respectable class.—Ed.

its being 'founded on a real fact that happened in the island of St Christopher.'

To judge by the number of poems with no other title than 'Written in a blank leaf of' this or that volume, it would seem that a white page in any book was too great a temptation for these ancient bards to fight against, even although they had not anything particular to set down upon it. We are inclined to think that the expense and scarcity of paper in their time must be accountable for this, for we observe that Mr Browning and Mr Tennyson do not resort in these days for a place of record for their ideas to the fly-leaves of the books their friends lend them.

Amongst the 'Epigrams, Epitaphs, and other Little Pieces,' the immense proportion which the titles bear to the productions themselves is still more remarkable. We moderns would never surely put to a poor couplet such a water-in-the-brain-affected heading as this which follows:

On a very Rich Gentleman drinking the Waters of Tunbridge Wells, who had refused to contribute to the Relief of a Distressed Family.

For deepest woes old Harpax scorns to feel,
Think ye his bowels stand in need of steel?

The principal point is always italicised, for fear the reader should chance not to see the joke. The parsons suffer terribly, and one epigram out of three, at least, of these old wits has got a divine for its butt; and we are sorry to add also, that among many of these *jeux d'esprit* there is more than a fair sprinkling of imprecation.

A Case of Conscience submitted to a Late Dignitary of the Church on his Narcotic Exposition of the following text: 'Watch and pray, lest ye enter into Temptation.'

By our pastor perplexed, how shall we determine?
'Watch and pray,' says the text; 'Go to sleep,' says the sermon.

Whenever, it seems, any person of the last century had a good thing to say, instead of issuing it at once fresh from his mental mint, he took it away into some private room, and cut it into metre, mixing it up in the proportion of three-fourths alloy to one-fourth—which was the last line—genuine gold, and so brought it back again to his company in the form of verse. A clergyman, not being 'capped' by his parishioner, thus reproves him:

The gownsmen stopped, and turning, sternly said:
'I doubt, my lad, you're far worse taught than fed.'
'Why, ay,' quoth Tom, still jogging on, 'that's true;
Thank God, he feeds me, but I'm taught by you.'

And there are four more stupid lines, which we have not quoted, introductory to the bon-mot. Silence and attention was gained by the recital of these beforehand, and they were probably made duller than they need have been, for the sake of contrast with the witticism when it should be at last let out. These lines 'Upon a Lady who squinted,' are unusually compact:

If ancient poets Argus prize,
Who boasted of a hundred eyes;
Sure, greater praise to her is due
Who looks a hundred ways with two.

Here is an epigram upon Moore, our unknown poet, who, it seems, had the reputation of being a borrower:

Moore always smiles whenever he recites,
He smiles, you think, approving what he writes;
But yet in this no vanity is shewn:
A modest man may like *what's not his own*.

Next to the clergy, the married state is the most popular subject for railery, there being scores of 'elegant extracts' expressive of delight at the death of a wife, and comfort in her being safely 'grassed in:'

Cries Ned to his neighbours, as onward they pressed,
Conveying his wife to her place of long rest:
'Take, friends, I beseech you, a little more leisure,
For why should we thus make a toil of a pleasure?'

Third in the list of favourite subjects for pasquinade are, we regret to see, the Scotch—a fact which points pretty clearly to the political period at which most of these were written. Here is one by Cleveland, who has had the impudence even to set his name to it:

Had Cain been a Scot, God had altered his doom,
Not forced him to wander, but kept him at home.

We forget the name of the author to whom Johnson attributes that line popularly believed to have occurred in the theme of an Eton boy upon the marriage in Cana, but it is here introduced, much spoiled, and in company with three wretched companions, as Aaron Hill's:

When Christ at Cana's feast, by power divine,
Inspired cold water with the warmth of wine,
'See,' cried they, while in reddening tide it gushed,
'The bashful stream hath seen its God, and blushed.'

Bob and Ned, Jack and Roger, Tom and Dick, are the male *dramatis personæ* of these epigrams, and Chloe and Stella the female:

A FAIR GROUND FOR PRIDE.

Jack his own merit sees; this gives him pride,
For he sees more than all the world beside.

Most of this sort are dull, or else well known; but we will conclude with one that is new, at least to our ears, and pregnant with wisdom; it is, we believe, by the poet Prior:

To John I owed great obligation;
But John unhappily thought fit
To publish it to all the nation:
Sure John and I are more than quit.

THE MONTH:

SCIENCE AND ARTS.

THE new year opens as promisingly for science as the old year ended. Astronomers and geologists, chemists, naturalists, and natural philosophers, and many others, are busy with important researches. Catastrophes in the money-market, or in India or China, divert them not; neither does a royal marriage make them pause in their endeavours to rifle nature of her secrets. Some few there are—to whom the name philosophers may be justly applied—so earnest in their work, so convinced of the value of time, that they never by any chance accept an invitation to dinner or to an evening-party. To them science owes her proudest achievements.

Mr Faraday is to make known in a lecture some of the results of his late researches. When that takes place, there will not be a spare seat in the theatre of the Royal Institution, for hundreds who don't understand, and don't much care about science, go to hear the learned professor because it is fashionable to do so. Dr Tyndall, pursuing his inquiry into the phenomena of glaciers, will repeat the description of certain properties of ice, which he has already read before the Royal Society. In some of his experiments on the melting of ice, he finds a singularly beautiful phenomenon; that the water which first appears on the surface of the frozen mass has always the form of an elegant flower with expanded petals. While in this there may be a suggestive fact for the crystallographer, the geologist will find additional explanations as to the cause of the motion of glaciers. Those who are interested in this question will find it treated of among other phenomena in an able paper by Professor Hitchcock in the last volume of the *Smithsonian*

Contributions to Knowledge, published at Washington. It reviews the whole subject of *Surface Geology*, tracing effects to their causes in the drift-period—the period of beaches and moraines, with notices of *Ancient Seamounts*—the period of terraces, and, lastly, the historic. It is a valuable contribution to a portion of geological science which has not been sufficiently treated of.—Mr Sorby, on the other hand, has been diving deep down into the bowels of volcanoes, and shews that crystals of quartz and granite are not simply igneous crystals, but aque-igneous, formed under tremendous pressure. He has been led to this conclusion by observing that quartz and granite, when examined under the microscope, are found to contain millions on millions of minute cells or cavities, in which water is enclosed. The water has been drawn off in sufficient quantity to be experimented on; so there is no doubt of its presence. It is only right to mention that the fact was first discovered by Mr Bryson of Edinburgh; but he did nothing towards working it out to its consequences as Mr Sorby has done. The discovery is a surprising one for geologists, as it opens a new view of the structure of volcanic rocks, and leads to the inference that water intensely heated and forcibly hindered from vaporising, has played a highly important part in the crystalline formation. Mr Sorby has exhibited his specimens at meetings of the Royal and Geological Societies, and is now engaged in further investigations.

Not less interesting is a discovery announced at a meeting of the Vaudois Society of Natural Sciences at Lausanne, and not less a surprise for geologists. It appears that the draining of a lake near Moosseedorf, canton of Berne, brought to light a bed of peat, through which numerous stakes were driven. On the surface of this peat, nearly a thousand specimens of pottery, stone-chisels, flint arrow-heads, and bears' teeth, perforated so as to be strung for bracelets and collars, were met with. There were no signs of metal; but bones of wild and domestic animals—some still undetermined—were numerous; and among these were picked up an atlas and jaw of the *Cervus euryceros*, or Great Irish Elk. The capital fact consists in the discovery of the last mentioned, for no remains of the great elk had ever yet been found along with human remains, or with any relics shewing that the animal had lived on the earth at the same time with man.

Mr Robert Mallet's catalogue of earthquakes, drawn up for the British Association, will contain startling facts for the next meeting, collected from the calamitous earthquakes last month in Italy. Some geologists have gone to the spot to make notes of the effects produced. Sir Charles Lyell was there recently, and wished to make special observations on Vesuvius; but the most tedious of Circumlocution Offices is at Naples, and he could not waste time in waiting for the official permit.

Unger shews that vegetable growths produce limestone: such as certain species of algae so constituted that they secrete and deposit carbonate of lime from sea-water. He has subjected the plants to experiment, in which the calcareous matter being all dissolved out, the vegetable texture remained clearly demonstrable.

In a conversation that took place a short time since at a meeting of the Entomological Society, concerning the changes in the species and habits of animals produced by climate, Professor Milne Edwards said that the existing species of ibis is identical with that found preserved in Egyptian mummies.—In a communication to the same Society on a New Genera and Species of Coleoptera, Mr Pascoe raises a question for philologists. 'Why not get rid,' he argues, 'of the word beetle, which is not confined, in common parlance, to the Coleoptera, and is almost universally applied to the cockroach only, by the vulgar? We have mammal and mollusk naturalised among us recently; why not

coleop?'—The Longmans have promised to include the word *telegram* in their forthcoming dictionary: will they be able to get Dr Latham's sanction for the new entomological word?—While on this subject, we may mention that Southern Italy—the scene of the late terrible earthquakes—chiefly a district of some miles around Volterra, had previously suffered from a plague of spiders. The Ragno rosso, as the peasants call it, had multiplied to such a prodigious extent, as to have become a very terror; and the more so, as its bite is more painful than that of the European scorpion. Each female lays from one hundred to two hundred eggs, and the increase would be greater than it is but for an ichneumon that devours all the egg-cocoons it meets with.

Astronomers are busy sounding the note of preparation for the eclipse of the sun, which will take place in March next; and different observatories are arranging to take special observations of the phenomenon. One will note the rose-coloured protuberances, another the effects of the darkness, another the appearance and peculiarities of the rays of light around the edge of the eclipsing body, and so forth. There are many important astronomical questions yet remaining to be solved, which admit of elucidation through the occurrence of eclipses: hence the scientific interest created by them. Indeed, as regards the sun, we may believe that its physical phenomena will henceforth be an especial object of study. The volume of *Smithsonian Contributions* above mentioned contains an elaborate paper 'On the Relative Intensity of the Heat and Light of the Sun upon different Latitudes of the Earth,' from which we quote a passage where the author—Mr Meech—attributes some geological changes of the earth to the motion of the whole solar system through space—a motion, he it remembered, of 400,000 miles an hour. 'In this,' says the author, 'continued for countless ages, the earth may have traversed the vicinity of some one of the fixed stars, which are suns whose radiance would tend to efface the vicissitudes of summer and winter, if not of day and night, with a more warm and equable climate. This may have produced those luxuriant forests, of which the present coal-fields are the remains; and thus the existence of coal-mines in Disco and other arctic islands may be accounted for. If no similar traces exist in the antarctic zone, the presumption will be strengthened that the north pole was presented more directly to the rays of such illuminating sun or star.' There is scope for the imagination here, whatever may be the scientific value of the notion—the world gradually becoming aware that a second sun was shining in the firmament, brighter and hotter for many years, till the luxuriance of the tropics streamed up to the polar zones; and then the gradual decline of light and heat, the strange sun diminishing to a speck, and disappearing at last from human eyes. It is a theme that might inspire a poet.

Mr Broun, who left Sir T. M. Brisbane's observatory near Kelso, to take charge of the Rajah of Travancore's observatory at Trevandrum, has just sent over a printed Report, from which we learn that meteorology and magnetism occupy his attention as well as astronomy. Aided by the rajah's liberality, he has built an observatory on the Agastier Peak—a summit in the Western Ghats, 6200 feet above the sea—for the purpose of carrying on a series of hourly observations of thermometer, barometer, actinometer, and magnets, simultaneously with similar series in the observatory at Trevandrum. By this means, the effect of elevation will be discovered, and the data thence derivable are much in request at present by the chiefs of magnetic and meteorological science, to aid in the discussion of observations. Notwithstanding the draughts of natives placed at his service, Mr Broun had more trouble in erecting his observatory than Professor Piazzi Smyth

had in his exploit on Teneriffe (of which, by the way, he has published a highly graphic narrative). But there is something to repay him (Mr Broun) in the magnificent prospect; and while he is discovering the relations between the higher and lower regions of the atmosphere, he can overlook the whole south of the peninsula as far as Cape Comorin, and, but for an intervening height, would get a view of Adam's Peak in Ceylon.

In connection with meteorology, it is desirable to remember that regular daily observations are made at many places in England and on the continent of Europe, of the rise and fall of the barometer and changes of the wind, the rainfall, &c.: from all of which there will in time appear a large mass of materials and facts for comparison, and as our knowledge of atmospheric waves and the allied phenomena increases, we may hope to get to some positive acquaintance with the laws of the weather.—The Austrian government has 'the hand at the bellows,' to use a sailor's term, in a way that deserves notice. Having deepened the port of Venice so as to admit large vessels, they wish to render the navigation of the Adriatic safer, by diminishing the force of the *bora*—that mighty wind. Now, it happens that Mount Nanas, near Adelsberg, is the father of the *bora*; so on all the hills and heights between Nanas and the sea, trees are to be planted, which—sheltered by walls while young—will, it is believed, grow up and break the force of the wind before it reaches the gulf.

Father Caselli of Florence has invented and perfected an electric telegraph by which written messages may be transmitted and received, some three or four at the same time, and at the rate of five hundred letters or signs in a minute. An autographic communication from the reverend inventor was read at the meeting of the Vandois Society above referred to. At another meeting, M. Bischoff demonstrated to the members that an alkaline solution of silver reduced with sugar, could be advantageously used for the silvering of glass, especially for concave mirrors and reflectors required of unusual brightness.—Professor Helmholtz has invented an instrument to which he gives the name of *telescope*, which is to be used in looking at natural landscapes. In few words, it may be described as a box fitted with mirrors at certain angles, and with feebly concave lenses for eye-pieces. According to the professor, its special merit is, that it enables the spectator to judge of the proportions and distances of a landscape, particularly mountain scenery, much more accurately than with the unassisted eye.—An instrument for indicating sounds has just been exhibited by M. Léon Scott, a corrector of the press at Paris. It comprises a receiver terminated by a membrane; the membrane when disturbed operates on a pencil, and the pencil marks the effect on a moving band of paper. According to the intensity of the sound affecting the membrane, so is the mark; and what is remarkable, it is found that the marks vary according as the sound is harmonious or discordant; though the intensity may be the same. The one leaves regular traces, the other irregular. Hence it is thought the instrument may be useful in the study of vibratory phenomena in the air. This is not the first time that sound has been made visible, so to speak: Professor Wheatstone invented an instrument some years ago, which exhibited the effects of different sounds on a tympanum, all explicable on definite philosophical principles.—Another invention by a young French midshipman will, if it bear the test of further experiment, prove highly useful in the oceanic surveys. It is an instrument which, dropped overboard from a ship, indicates the strength and direction of the under-currents by which the depths of the sea are so numerous and so astonishingly traversed. The construction of the instrument is ingenious, and

hitherto it gives more satisfactory indications than any other.

The demand for fibrous material for commercial purposes has led to the utilisation of a product of which huge bonfires have been and are still made every autumn in Herefordshire, Kent, and Surrey. We mean the hopbine. Excellent wrapping-paper is now manufactured of that climber; and hop-growers may comfort themselves for a bad season by the sale of what they have heretofore wasted. And besides this, experiments have been tried with success to make millboards out of the spent hops, of which the great breweries yield so abundant a supply. It is one of the characteristics of the present time to convert refuse to useful purposes, and these are note-worthy examples.

The Royal Agricultural Society offer a prize of £50 for the best report 'on the results of microscopic observation applied to the vegetable physiology of agriculture.' There is the question; and we doubt not that competent men are ready to give the answer. The Rev. E. F. Manby has communicated to the Society's *Journal* an account of an improved method of potato-culture, whereby he gets two crops a year with little or no disease. The Morecambe potato is the kind he recommends—a kind much in request in the large towns of Lancashire and the West Riding. 'They form,' he says, 'a dish fit for an epicure—light and floury, the delicate skin cracked and bursting.' The land is to be dug by hand-labour, and then the secret for getting potatoes ripe in August that will keep all the winter is—'to set them well sprouted. There is no occasion to put them in early: the last week in April or first week in May will do.' To this he adds: 'The month of August is the critical time for the winter potato. But by sprouting the tuber before setting, you obtain nearly a month's advantage, so that when the disease does come, the plant is in a stronger state than it would otherwise be, and is thereby enabled to repel the attack.'

OCEOLA:

A ROMANCE.

CHAPTER XVII.—WEST POINT.

THE military college of West Point is the finest school in the world. Princes and priests have there no power; true knowledge is taught, and must be learned, under penalty of banishment from the place. The graduate comes forth a scholar, not, as from Oxford and Cambridge, the pert parrot of a dead language, smooth prosodian, mechanic rhymster of Idyllic verse; but a linguist of living tongues—one who has studied science, and not neglected art—a botanist, draughtsman, geologist, astronomer, engineer, soldier—all; in short, a man fitted for the higher duties of social life—capable of supervision and command—equally so of obedience and execution.

Had I been ever so much disinclined to books, in this institution I could not have indulged in idleness. There is no 'dunce' in West Point. There is no favour to family and fortune: the son of the President would be ejected, if not able to dress up with the rank; and under the dread of disgrace, I became, perforce, a diligent student—in time, a creditable scholar.

The details of a cadet's experience possess but little interest—a routine of monotonous duties—only at West Point a little harder than elsewhere—at times but slightly differing from the slave-life of a common soldier. I bore them bravely—not that I was inspired by any great military ambition, but simply from a feeling of rivalry: I scorned to be the laggard of my class.

There were times, however, when I felt weariness from so much restraint. It contrasted unfavourably

with the free life I had been accustomed to; and often did I feel a longing for home—for the forest and the savanna—and far more for the associates I had left behind.

Long lingered in my heart the love of Maïmee—long time unaffected by absence. I thought the void caused by that sad parting would never be filled up. No other object could replace in my mind, or banish from my memory the sweet souvenirs of my youthful love. Morning, noon, and night, was that image of picturesque beauty outlined upon the retina of my mental eye—by day in thoughts, by night in dreams.

Thus was it for a long while—I thought it would never be otherwise! No other could ever interest me, as she had done. No new joy could win me to wander—no Lethe could bring oblivion. Had I been told so by an angel, I would not, I could not, have believed it.

Ah! it was a misconception of human nature. I was but sharing it in common with others—for most mortals have, at some period of life, laboured under a similar mistake. Alas! it is too true—love is affected by time and absence. It will not live upon memory alone. The capricious soul, however delighting in the ideal, prefers the real and positive. Though there are but few lovely women in the world, there is no one lovelier than all the rest—no man handsomer than all his fellows. Of two pictures equally beautiful, that is the more beautiful upon which the eye is gazing. It is not without reason that lovers dread the parting hour.

Was it books that spoke of lines and angles, of bastions and embrasures—was it drill, drill, by day, or the hard couch and harder guard *tour* by night—was it any or all of these that began to infringe upon the exclusivism of that one idea, and at intervals drive it from my thoughts? Or was it the pretty faces that now and then made their appearance at the 'Point'—the excursionary belles from Saratoga and Ballston, who came to visit us—or the blonde daughters of the patroons, our nearer neighbours, who came more frequently, and who saw in each coarse-clad cadet the chrysalis of a hero—the embryo of a general?

Which of all these was driving Maïmee out of my mind?

It imports little what cause—such was the effect. The impression of my young love became less vivid on the page of memory. Each day it grew fainter and fainter, until it was attenuated to a slim retrospect.

Ah! Maïmee! in truth it was long before this came to pass. Those bright smiling faces danced long before my eyes ere thine became eclipsed. Long while withstood I the flattery of those siren tongues; but my nature was human, and my heart yielded too easily to the seduction of sweet blandishments.

It would not be true to say that my first love was altogether gone: it was cold, but not dead. Despite the fashionable flirtations of the hour, it had its seasons of remembrance and return. Oft upon the still night's guard, home-scenes came flitting before me; and then the brightest object in the vision-picture was Maïmee. My love for her was cold, not dead. Her presence would have rekindled it—I am sure it would. Even to have heard from her—of her—would have produced a certain effect. To have heard that she had forgotten me, and given her heart to another, would have restored my boyish passion in its full vigour and entirety; I am sure it would.

I could not have been indifferent then? I must still have been in love with Maïmee?

One key pushes out the other; but the fair daughters of the north had not yet obliterated from my heart this dark-skinned damsel of the south.

During all my cadetship, I never saw her—never

even heard of her. For five years I was an exile from home—and so was my sister. At intervals during that time we were visited by our father and mother, who made an annual trip to the fashionable resorts of the north—Ballston Spa, Saratoga, and Newport. There, during our holidays, we joined them; and though I longed to spend a vacation at home—I believe so did Virginia—the 'mother was steel and the father was stone,' and our desires were not gratified.

I suspected the cause of this stern denial. Our proud parents dreaded the danger of a *mésalliance*. They had not forgotten the tableau on the island.

The Ringolds met us at the watering-places; and Arens was still assiduous in his attentions to Virginia. He had become a fashionable exquisite, and spent his gold freely—not to be outdone by the *ci-devant* tailors and stock-brokers, who constitute the 'upper ten' of New York. I liked him no better than ever, though my mother was still his backer.

How he sped with Virginia, I could not tell. My sister was now quite a woman—a fashionable dame, a belle—and had learnt much of the world—among other things, how to conceal her emotions—one of the distinguished accomplishments of the day. She was at times merry to an extreme degree; though her mirth appeared to me a little artificial, and often ended abruptly. Sometimes she was thoughtful—not unfrequently cold and disdainful. I fancied that in gaining so many graces, she had lost much of what was in my eyes more valuable than all, her gentleness of heart. Perhaps I was wronging her.

There were many questions I would have asked her, but our childish confidence was at an end, and delicacy forbade me to probe her heart. Of the past we never spoke: I mean of *that* past—those wild wanderings in the woods, the sailings over the lake, the scenes in the palm-shaded island.

I often wondered whether she had cause to remember them, whether her souvenirs bore any resemblance to mine!

On these points, I had never felt a definite conviction. Though suspicious—at one time even apprehensive—I had been but a blind watcher, a too careless guardian.

Surely my conjectures had been just, else why was she now silent upon themes and scenes that had so delighted us both? Was her tongue tied by the after-knowledge that we had been doing wrong—only known to us by the disapproval of our parents? Or, was it that in her present sphere of fashion, she disdained to remember the humble associates of earlier days?

Often did I conjecture whether there had ever existed such a sentiment in her bosom; and, if so, whether it still lingered there? These were points about which I might never be satisfied. The time for such confidences had gone past.

'It is not likely,' reasoned I; 'or if there ever was a feeling of tender regard for the young Indian, it is now forgotten—obliterated from her heart, perhaps from her memory. It is not likely it should survive in the midst of her present associations—in the midst of that *entourage* of perfumed beaux who are hourly pouring into her ears the incense of flattery. Far less probable *she* should remember than I; and have not I forgotten?'

Strange, that of the four hearts I knew only my own. Whether young Powell had ever looked upon my sister with admiring eyes, or she on him, I was still ignorant, or rather unconvinced. All I knew was by mere conjecture—suspicion—apprehension. What may appear stranger, I never knew the sentiment of that other heart, the one which interested me more than all. It is true, I had chosen to fancy it in my favour. Trusting to glances, to gestures, to slight actions, never to words, I had fondly hoped; but often,

too, had I been the victim of doubt. Perhaps, after all, Maimee had never loved me!

Many a sore heart had I suffered from this reflection. I could now bear it with more complacency; and yet, singular to say, it was this very reflection that often awakened the memory of Maimee; and, whenever I dwelt upon it, produced the strongest revulsions of my now spasmodic love!

Wounded vanity! powerful as passion itself! thy throes are strong as love. Under their influence, the chandeliers grow dim, and the fair forms flitting beneath lose half their brilliant beauty. My thoughts go back to the flowery land—to the lake—to the island—to Maimee.

Five years soon flitted past, and the period of my cadetship was fulfilled. With some credit, I went through the ordeal of the final examination. A high number rewarded my application, and gave me the choice of whatever arm of the service was most to my liking. I had a penchant for the rifles, though I might have pitched higher, into the artillery, the cavalry, or engineers. I chose the first, however, and was gazetted brevet-lieutenant, and appointed to a rifle regiment, with leave of absence to revisit my native home.

At this time, my sister had also 'graduated' at the Ladies' Academy, and carried off her 'diploma' with credit; and together we journeyed home.

There was no father to greet us on our return: a weeping and widowed mother alone spoke the melancholy welcome.

CHAPTER XVIII.

THE SEMINOLES.

On my return to Florida, I found that the cloud of war was gathering over my native land. It would soon burst, and my first essay in military life would be made in the defence of hearth and home. I was not unprepared for the news. War is always the theme of interest within the walls of a military college; and in no place are its probabilities and prospects so fully discussed or with so much earnestness.

For a period of ten years had the United States been at peace with all the world. The iron hand of 'Old Hickory' had awed the savage foe of the frontiers. For more than ten years had the latter desisted from his chronic system of retaliation, and remained silent and still. But the pacific *status quo* came to an end. Once more the red man rose to assert his rights, and in a quarter most unexpected. Not on the frontier of the 'far west,' but in the heart of the flowery land. Yes, Florida was to be the theatre of operations—the stage on which this new war-drama was to be enacted.

A word historical of Florida, for this writing is in truth a history.

In 1821, the Spanish flag disappeared from the ramparts of San Augustine and St Marks, and Spain yielded up possession of this fair province—one of her last footholds upon the continent of America. Literally, it was but a foothold that the Spaniards held in Florida—a mere nominal possession. Long before the cession, the Indians had driven them from the field into the fortress. Their haciendas lay in ruins—their horses and cattle ran wild upon the savannas; and rank weeds usurped the site of their once prosperous plantations. During a century of dominion, they had made many a fair settlement, and the ruins of buildings—far more massive than aught yet attempted by their Saxon successors—attest the former glory and power of the Spanish nation.

It was not destined that the Indians should long hold the country they had thus reconquered. Another race of white men—their equals in courage and

strength—were moving down from the north; and it was easy prophecy to say that the red conquerors must in turn yield possession.

Once already had they met in conflict with the pale-faced usurpers, led on by that stern soldier who now sat in the chair of the president. They were defeated, and forced further south, into the heart of the land—the centre of the peninsula. There, however, they were secured by treaty. A covenant solemnly made, and solemnly sworn to, guaranteed their right to the soil, and the Seminole was satisfied.

Alas! the covenants between the strong and the weak are things of convenience, to be broken whenever the former wills it—in this case, shamefully broken.

White adventurers settled along the Indian border; they wandered over Indian ground—not wandered, but went; they looked upon the land; they saw that it was good—it would grow rice and cotton, and cane and indigo, the olive and orange; they desired to possess it, more than desired—they resolved it should be theirs.

There was a treaty, but what cared they for treaties? Adventurers—starved-out planters from Georgia and the Carolinas, 'nigger-traders' from all parts of the south; what were covenants in their eyes, especially when made with red-skins? The treaty must be got rid of.

The 'Great Father,' scarcely more scrupulous than they, approved their plan.

'Yes,' said he, 'it is good—the Seminoles must be dispossessed; they must remove to another land; we shall find them a home in the west, on the great plains; there they will have wide hunting-grounds, their own for ever.'

'No,' responded the Seminoles; 'we do not wish to move; we are contented here: we love our native land; we do not wish to leave it; we shall stay.'

'Then you will not go willingly? Be it so. We are strong, you are weak; we shall force you.'

Though not the letter, this is the very spirit of the reply which Jackson made to the Seminoles!

The world has an eye, and that eye requires to be satisfied. Even tyrants dislike the open breach of treaties. In this case, political party was more thought of than the world, and a show of justice became necessary.

The Indians remained obstinate—they liked their own land—they were reluctant to leave it—no wonder.

Some pretext must be found to dispossess them. The old excuse, that they were mere idle hunters, and made no profitable use of the soil, would scarcely avail. It was not true. The Seminole was not exclusively a hunter; he was a husbandman as well, and tilled the land—rudely, it may be, but was this a reason for dispossessing him?

Without this, others were easily found. That cunning commissioner which their 'Great Father' sent them could soon invent pretexts. He was one who well knew the art of muddying the stream upwards, and well did he practise it.

The country was soon filled with rumours of Indian outrages—of horses and cattle stolen, of plantations plundered, of white travellers robbed and murdered—all the work of those savage Seminoles.

A vile frontier press, ever ready to give tongue to the popular furor, did not fail in its duty of exaggeration.

But who was to gazette the provocations, the retaliations, the wrongs and cruelties inflicted by the other side? All these were carefully concealed.

A sentiment was soon created throughout the country—a sentiment of bitter hostility towards the Seminole.

'Kill the savage! Hunt him down! Drive him out! Away with him to the west!' Thus was the sentiment expressed. These became the popular cries.

When the people of the United States has a wish, it is likely soon to seek gratification, particularly when that wish coincides with the views of its government; in this case, it did so—the government itself having created it.

It would be easy, all supposed, to accomplish the popular will, to dispossess the savage, hunt him, drive him out. Still there was a treaty. The world had an eye, and there was a thinking minority not to be despised who opposed this clamorous desire. The treaty could not be broken under the light of day; how, then, was this obstructive covenant to be got rid of?

Call the head men together, cajole them out of it; the chiefs are human, they are poor, some of them drunkards—bribes will go far, fire-water still further; make a new treaty, with a double construction—the ignorant savages will not understand it; obtain their signatures—the thing is done!

Crafty commissioner! yours is the very plan, and you the man to execute it.

It was done. On the 9th of May 1832, on the banks of the Oclawaha, the chiefs of the Seminole nation in full council assembled bartered away the land of their fathers!

Such was the report given to the world.

It was not true.

It was not a full council of chiefs; it was an assembly of traitors bribed and suborned, of weak men flattered and intimidated. No wonder the nation refused to accede to this surreptitious covenant; no wonder they heeded not its terms; but had to be summoned to still another council, for a freer and fuller signification of their consent.

It soon became evident that the great body of the Seminole nation repudiated the treaty. Many of the chiefs denied having signed it. The head chief, Onopa, denied it. Some confessed the act, but declared they had been drawn into it by the influence and advice of others. It was only the more powerful leaders of clans—as the brothers Omatia, Black Clay, and Big Warrior—who openly acknowledged the signing.

These last became objects of jealousy throughout the tribes; they were regarded as traitors, and justly so. Their lives were in danger; even their own retainers disapproved of what they had done.

To understand the position, it is necessary to say a word of the political status of the Seminoles. Their government was purely republican—a thorough democracy. Perhaps in no other community in the world did there exist so perfect a condition of freedom: I might add happiness, for the latter is but the natural offspring of the former. Their state has been compared with that of the clans of Highland Scotland. The parallel is true only in one respect. Like the Gael, the Seminoles were without any common organisation. They lived in 'tribes' far apart, each politically independent of the other; and although in friendly relationship, there was no power of coercion between them. There was a 'head-chief'—king he could not be called—for 'Mico,' his Indian title, has not that signification. The proud spirit of the Seminole had never sold itself to so absurd a condition; they had not yet surrendered up the natural rights of man. It is only after the state of nature has been perverted and abused, that the 'kingly' element becomes strong among a people.

The head 'mico' of the Seminoles was only a head in name. His authority was purely personal: he had no power over life or property. Though occasionally the wealthiest, he was often one of the poorest of his people. He was more open than any of the others to the calls of philanthropy, and ever ready to disburse with free hand, what was, in reality, not his people's, but his own. Hence he rarely grew rich.

He was surrounded by no retinue, girt in by no

barbarian pomp or splendour, flattered by no spongy courtiers, like the rajahs of the east, or, on a still more costly scale, the crowned monarchs of the west. On the contrary, his dress was scarcely conspicuous, often meaner than those around him. Many a common warrior was far more *gaillard* than he.

As with the head-chief, so with the chieftains of tribes; they possessed no power over life or property; they could not decree punishment. A jury alone could do this; and I make bold to affirm, that the punishments among these people were in juster proportion to the crimes than those decreed in the highest courts of civilisation.

It was a system of the purest republican freedom, without one idea of the levelling principle; for merit produced distinction and authority. Property was not in common, though labour was partially so; but this community of toil was a mutual arrangement, agreeable to all. The ties of family were as sacred and strong as ever existed upon the earth.

And these were *savages* forsooth—red savages, to be dispossessed of their rights—to be driven from hearth and home—to be banished from their beautiful land to a desert wild, to be shot down and hunted like beasts of the field! The last in its most literal sense, for dogs were to be employed in the pursuit!

CHAPTER XIX.

AN INDIAN HERO.

There were several reasons why the treaty of the Oclawaha could not be considered binding on the Seminole nation. First, it was not signed by a majority of the chiefs. Sixteen chiefs and sub-chiefs appended their names to it. There were five times this number in the nation.

Second, it was, after all, no treaty, but a mere conditional contract—the conditions being that a deputation of Seminoles should first proceed to the lands allotted in the west (upon White River), examine these lands, and bring back a report to their people. The very nature of this condition proves that no contract for removal could have been completed, until the exploration had been first accomplished.

The examination was made. Seven chiefs, accompanied by an agent, journeyed to the far west, and made a survey of the lands.

Now, mark the craft of the commissioner! These seven chiefs are nearly all taken from those friendly to the removal. We find among them both the Omatias, and Black Clay. True, there is Hoitle-mattee (jumper), a patriot, but this brave warrior is stricken with the Indian curse—he loves the fire-water; and his propensity is well known to Phagan, the agent, who accompanies them.

A *ruse* is contemplated, and is put in practice. The deputation is hospitably entertained at Fort Gibson, on the Arkansas. Hoitle-mattee is made merry—the contract for removal is spread before the seven chiefs—they all sign it: the juggle is complete.

But even this was no fulfilment of the terms of the Oclawaha covenant. The deputation was to return with their report, and ask the will of the nation. That was yet to be given; and, in order to obtain it, a new council of all the chiefs and warriors must be summoned.

It was to be a mere formality. It was well known that the nation as a body disapproved of the facile conduct of the seven chiefs, and would not endorse it. They were not going to 'move.'

This was the more evident, since other conditions of the treaty were daily broken. One of these was the restoration of runaway slaves, which the signers of the Oclawaha treaty had promised to send back to their owners. No blacks were sent back; on the contrary,

they now found refuge among the Indians more secure than ever.

The commissioner knew all this. He was calling the new council out of mere formality. Perhaps he might persuade them to sign—if not, he intended to awe them into the measure, or force them at the point of the bayonet. He had said as much. Troops were concentrating at the agency—Fort King—and others were daily arriving in Tampa Bay. The government had taken its measures; and coercion was resolved upon.

I was not ignorant of what was going on, nor of all that had happened during my long years of absence. My comrades, the cadets, were well versed in Indian affairs, and took a lively interest in them—especially those who expected soon to escape from the college walls. 'Black Hawk's war,' just terminated in the west, had already given some a chance of service and distinction, and young ambition was now bending its eyes upon Florida.

The idea, however, of obtaining glory in such a war was ridiculed by all. 'It would be too easy a war—the foe was not worth considering. A mere handful of savages,' asserted they; 'scarcely enough of them to stand before a single company. They would be either killed or captured in the first skirmish, one and all of them—there was not the slightest chance of their making any protracted resistance—*unfortunately*, there was not.'

Such was the belief of my college-companions; and, indeed, the common belief of the whole country, at that time. The army, too, shared it. One officer was heard to boast that he could march through the whole Indian territory with only a corporal's guard at his back; and another, with like bravado, wished that the government would give him a charter of the war, on his own account. He would finish it for 10,000 dollars!

These only expressed the sentiments of the day. No one believed that the Indians would or could sustain a conflict with us for any length of time; indeed, there were few who could be brought to think that they would resist at all: they were only holding out for better terms, and would yield before coming to blows.

For my part, I thought otherwise. I knew the Seminoles better than most of those who talked—I knew their country better; and, notwithstanding the odds against them—the apparent hopelessness of the struggle—I had my belief that they would neither yield to disgraceful terms, nor yet be so easily conquered. Still, it was but a conjecture; and I might be wrong. I might be deserving the ridicule which my opposition to the belief of my comrades often brought upon me.

The newspapers made us acquainted with every circumstance. Letters, too, were constantly received at the 'Point' from old graduates now serving in Florida. Every detail reached us, and we had become acquainted with the names of many of the Indian chieftains, as well as the internal *politique* of the tribe. It appeared they were not united. There was a party in favour of yielding to the demands of our government, headed by one *Omatla*. This was the traitor party, and a minority. The patriots were more numerous, including the head 'mico' himself, and the powerful chiefs Holata, Coa-hajo, and the negro Abram.

Among the patriots there was one name that, upon the wings of rumour, began to take precedence of all others. It appeared frequently in the daily prints, and in the letters of our friends. It was that of a young warrior—or sub-chief, as he was styled—who by some means or other had gained a remarkable ascendancy in the tribe. He was one of the most violent opponents of the 'removal'; in fact, the leading spirit that opposed it; and chiefs much older and more powerful were swayed by his counsel.

We cadets much admired this young man. He was described as possessing all the attributes of a hero—of noble aspect, bold, handsome, intelligent. Both his physical and intellectual qualities were spoken of in terms of praise—almost approaching to hyperbole. His form was that of an Apollo, his features those of Adonis or Endymion. He was first in everything—the best shot in his nation, the most expert swimmer and rider—the swiftest runner, and most successful hunter—alike eminent in peace or war—in short, a Cyrus.

There were Xenophons enough to record his fame. The people of the United States had been long at peace with the red men. The romantic savage was far away from their borders. It was rare to see an Indian within the settlements, or hear aught of them. There had been no late deputations from the tribes to gratify the eyes of gazing citizens; and a real curiosity had grown up in regard to these children of the forest. An Indian hero was wanted, and this young chief appeared to be the man.

His name was OCEOLA.

MAMMA'S PET.

WOMEN and children!—what a sight
Was there when, gathered to her breast
After their bloody breathless flight,
Calcutta bade the victims rest!
Strong men, with voices weak and low,
Stood by to ask their names, their woe.

Some answered but with choking sighs
And wringing hands; and some stood there
Heedless, with their unconscious eyes
Fixed in a blank and ghostlike stare;
Some told their tale in screams, and some
Covered their faces and were dumb.

One of the throng, a little child,
A fair-haired girl, was all alone;
No mother on her darling smiled,
No brother spoke in cheering tone:
All, all alone, with eyes serene,
She gazed upon that strange sad scene.

They came to her, these pitying men,
And one beside her knelt, and took
The orphan to his breast, and then,
With gentle voice, and gentler look,
'Dear child, what is your name?' he cried:
'I'm mamma's pet,' the child replied.

The wild moustache, the rough black beard
Quivered: upon her golden head
He laid his broad brown hand, and cleared
His husky throat: 'Poor child,' he said,
'You are called something more—say yet
Your name.'—'I'm just mamma's sweet pet.'

O mother in your dismal grave,
O murdered father, hear us vow
Our homage to the fond and brave
To lavish on that baby brow,
To pay in love our sacred debt—
For yours shall be the Nation's pet!

PORTLAND AND THE BREAKWATER.

NOTWITHSTANDING the proverbial gloom of November, the sun shone as brightly as though nature did not believe the almanac, when, a few days since, we found ourselves on board a Weymouth steamer, bound for Portland. The voyage, it is true, was expected to occupy only half an hour; still, it was a very pleasant thing to have fair weather.

The Bay of Weymouth looked extremely picturesque on that occasion. The long line of white cliffs, with their broken headlands, seemed almost to landlock the bay. It chanced, fortunately, that the incident of light and colouring was peculiarly beautiful and varied. The sky was, in truth, heavenly azure, diversified with soft white clouds, changing every moment under the influence of the plastic wind, which dallied with the sky drapery till its fashion was all beautiful. The blue sea was covered with a tracery of dancing gold spangles, and the white-crested waves rode cheerily into the shore, giving life and animation to the whole scene.

As we receded from the shore, the different objects of interest in the neighbourhood of Weymouth were pointed out to us. The moors, treeless, but green and undulating, have here and there oases of luxuriant verdure; and under shelter of the hillside, villages nestle themselves, as at Preston and Osmington, with a picturesque church for warden of the happy valley. It was very interesting to watch the cloud-shadows, chasing each other over the wide expanse of down; now throwing the cliffs into dark and bold relief against the bright sky, and now revealing in intensest sunlight every detail of broken rock and shelving shore, every hue of colour, every change of sand and shingle, and far-stretching sunken ledges. It was more like a good water-colour drawing than almost anything English we had ever looked upon.

Ringstead and Lullworth, we were told, are places of interest. St Albans Head was the extreme point discernible. We soon rounded that part of the mainland which unfortunately shuts out the view of Portland from the town of Weymouth, and now we found ourselves in sight of the island, which rises rather grandly from the water. Many persons have compared it to Gibraltar; and as it appeared on this occasion, its height was exaggerated by a lingering mist which veiled its summit.

The island has naturally a very warlike look; and now a substantial fort, in course of erection, is cresting the near extremity—a commanding position, and one of great importance in guarding the roadstead.

One of the most remarkable features connected with

Portland is the 'Chesil Bank,' which in reality unites it with the mainland; so that the *isle* of Portland is in fact a peninsula. Still, we cannot help holding by its common designation. The bank we have just mentioned is a mound of shingle, about two hundred yards in width, and more than ten miles in length; nearly, but not quite touching the nearest point of the opposite shore, and then 'running up in the form of a narrow isthmus along the western seaboard of Dorsetshire.' This singular formation, which is about forty feet above highwater-mark, acts as a natural breakwater to the anchorage of Portland Roads, sheltering the east bay against westerly gales.

'The shingle of the Chesil Bank,' says Mr Coode, in his admirable paper read before the Institution of Civil Engineers in May 1853, 'is composed chiefly of chalk-flints, with a small proportion of pebbles from the red sandstone. . . . A peculiar kind of jasper with flesh-coloured red predominating, is not very uncommon. . . . There are also occasionally pebbles which are decidedly porphyritic. . . . As a proof of the solidity of the mass, it may here be noticed that the water never percolates from the west bay into the east bay, except in the heaviest gales from the south-west—notwithstanding that ordinary tides in moderate weather rise to two or three inches higher, and fall out two feet nine inches lower on the west side than the east.'

The questions which arise respecting this formation are highly interesting, and are closely followed out in the paper from which we quote. When we come to examine the materials which compose the accumulated mass, we are led by geologists to trace back their origin to strata which would naturally afford this débris; and, according to the shewing of Mr Coode, such strata are not to be found save on the *west* coast, as far down as Lyme-Regis. Accepting this fact, we are led to reason on the movements and deposition of shingle, and to balance probabilities between the effect of tidal currents or wind-waves upon these travelling masses.

The theory that the *wind-waves* are the primary cause of the transit of débris from distant strata, is ably supported by Mr Coode. He multiplies instances of shingle borne by the heaviest seas in opposition to the prevailing current of the tide. The form of the bank varies considerably under the influence of severe gales of wind; the concussion of the receding meeting the on-coming wave is sometimes so great, 'that an enormous body of broken water and spray will sometimes rise perpendicularly into the air to a height of sixty or seventy feet.'

There is a curious anecdote connected with the force of winds and waves, which may not be known to all

our readers. On the 28d of November 1824, a ship of 100 tons burden, having on board stores and heavy guns, 'being unable to weather Portland, as a last resource, was run directly on to the Cheil Bank under canvas. She happened to come in on the top of a sea, and by her momentum was carried on to the crest of the bank, where she remained for some time, and was ultimately launched into the eastern bay.'

We found an hour had already flown in listening to local traditions, and in examining this curious shingle-beach, which so happily forms a natural breakwater just in the right place. We could not, however, leave the place without noticing the local boats, called 'lerrets,' which are used by the fishermen of this district. They are quite peculiar, and 'are propelled by the rowers on one side pulling stroke alternately with those on the other, thus giving the boat a tortuous motion through the water.' The fishermen consider this method economises power. Certain it is, they are a hardy race, and manage their barks most skillfully.

Till lately, the Portlanders have been an isolated people, preserving many old-world customs, and never marrying out of the island; but their primitive habits and manners have been invaded by the march of physical science and the mechanical arts, which sometimes drive in civilisation with a sledge-hammer, where the soil will not take kindly to the seed.

Apropos of engineering triumphs, we now bend our steps to the breakwater, which is being constructed at Portland, and is the great object of attraction. Leaving the Cheil Bank to the right, the visitor proceeds along the shore for some quarter of a mile, through a 'Pelion upon Ossa' of stone, iron, and miscellaneous materials, when arriving at the lodge, his name is required, and he is then free to see the works.

At present, the whole place is encumbered by a vast wooden staging, over which railway lines intersect each other; together with the tools and appliances required by engineers, masons, smiths, carpenters, divers, and others. Horses tramp along the wooden causeway, steam-engines hiss and roar, iron chains clank, and wheels revolve with ceaseless noise.

At first, it is difficult to realise what all this is about, but curiosity soon leads you onward where the tide of business seems tending.

Here it may be well to say a few words about the history of the breakwater. About 1794 it occurred to Mr Hervey of Weymouth, who was evidently a very intelligent and far-sighted individual, that it would be highly desirable to have a breakwater for the purpose of sheltering the Portland Roads. It was a fixed idea in his mind, and he appears to have pursued the subject with an earnestness worthy of the cause. He memorialised and petitioned all to no use, and died, leaving his suggestion a legacy to parliament, who very wisely came to the conclusion, some ten years ago, that this coast required a harbour, and that the tremendous works of a similar kind at Cherbourg were a significant hint. The breakwater was accordingly commenced in 1847; but the ceremony of laying the foundation-stone did not take place till the 25th of July 1849, when that duty was performed by the prince-consort.

The breakwater is designed to be 2500 yards in length, and will shelter 2107 acres of Portland Bay—1760 acres of which will have from two to ten fathoms at low-water spring-tides, having excellent anchorage in a strong blue clay, with other advantages of good water, and an almost inexhaustible supply of ballast.

It appears that a great many vessels have been lost, and lives sacrificed on this coast, owing to the want of a harbour of refuge—for none such exists between Plymouth and Spithead, a distance of 140 miles.

There are peculiar facilities in the locality for the construction of this great work. The quarries of

Portland afford a ready supply of material. There were millions of tons of refuse stone already quarried, and available for the foundation of the breakwater, which, together with the blocks of stone required for the superstructure, might be easily conveyed to the works.

We should here remind our readers that government has a prison establishment at Portland, where some 1500 convicts are kept employed, principally in the quarries which supply the material for this great undertaking.

The stone is being worked at about 300 feet above the level of the sea, and is conveyed by convict and horse labour to a railway which has been constructed for its transit. This line consists of three inclines, which fall one foot in ten. 'The loaded trucks are let down by wire-rope attached to drums, and in their descent draw up the empty trucks on a parallel line of railway; the speed is regulated by very powerful screw-breaks.' A self-registering machine weighs each load. The official report of the year ending the 31st of March 1857, from which we quote our statistics of the breakwater, informs us that 2,667,907 tons of rough stone have been deposited since the commencement of the works—this will give us some idea of their magnitude. The proximity of these quarries has considerably lessened the expense in the construction of the breakwater. Cherbourg cost the French government upwards of two millions—five millions have been expended altogether on that *porte*. And our own Plymouth Breakwater, though only 1760 yards in length, cost nearly if not quite two millions; whereas the original estimate made in 1846 for the Portland Breakwater was between five and six hundred thousand pounds. (This, however, did not include any masonry except that in the 'heads.') It has since been deemed expedient to extend the structure, and also to make it applicable for coaling and watering establishments, suitable for the largest ships of the navy; these additions, together with other enlargements upon the original plan, have brought the net estimated expenditure to L.844,125.

The scaffolding, or, more properly, staging, reaches at present about two-thirds of the projected extent of the breakwater: on this we walked. About a quarter of a mile from shore it is intended there should be an opening large enough to admit vessels into the harbour. The pier-heads at this point are nearly finished, and present a most resistant appearance. They are, for the most part, built of a peculiar kind of stone found in Portland, and called 'Roach' by the quarrymen; the outside or face of the heads being of large masses of granite from Cornwall. These piers seem planted immutably firm in the restless element which leaps vainly against this rampart of mechanical skill.

The tide was down, so we had an opportunity of seeing the footing or foundation, which is composed of rude pieces of rock, intermixed with rubble. For some distance, this is already covered with sea-weed, so that it has much the appearance of a natural ledge of rock; but as you proceed, you soon discover the hand of man. You see that the pieces have been recently flung there, and there is evidence of form growing out of chaos. We remarked a singularly fine specimen of an ammonite amongst the debris, nearly the circumference of a cart-wheel, and beautifully perfect. We looked with longing eyes, and wished it in our provincial museum; and this, though the finest fossil we saw, was by no means solitary, for scraps of the ammonite family lay in various directions.

The timber-staging, we should observe, is about 130 feet in width. There are five lines of railway on it, and a railed way for workmen and visitors. This mass of timber-work is supported at intervals by enormous wooden piles, which, as we were told, are constructed in the following manner. The piles end

in a disc of metal, in a spiral form, which enters the ground on the principle of the screw, and when it has entered a clay or sandy bottom, resists alike upward or downward pressure.

We appeared to be about thirty or forty feet above the then level of the tide; the sea was intensely green. There is something singularly beautiful in that peculiar colour—rightly called 'sea-green:' as we looked down, it was like a mass of emerald quartz, so bright, clear, and crystalline. There is always a fascination in gazing upon the mysterious sea, and its restless motions and throbbing tide-pulses. It would be difficult to say what pantheistic dreams we might not have indulged in, in our human sympathy for the ocean, had we not been startled out of all sentimentality by the thundering approach of a train, which made the whole place tremble, and ourselves likewise, so near it seemed to be upon our heels. We had no intention of disrupting the order of precedence, so drew aside while the heavily laden trucks, and *lastly*, the engine, passed us by.

We saw other trains advancing in rapid succession, and we followed to the scene of action. We shortly arrived at the extreme point which the staging has yet attained, nearly a mile out to sea. The lines of railway are occupied with the passage of trains which arrive every few minutes; each engine propels five trucks, which are severally loaded with about ten tons of stone. The space is left open between the rails, so that when the truck has come to the right point, the man in charge has only to touch a lever at the bottom, and the whole load is immediately let fall into the water.

But the effect is not to be described in these few words of bald description, and simple statement of the mechanical arrangements. It was a sight not soon to be forgotten. Imagine yourself standing on what was apparently, though not really, a frail and slender framework, which shook violently beneath the heavy roll of the engines and their trains, as they came up to discharge each its cargo of fifty tons of stone, which falls with the roar and dash of an avalanche into the seething, surging flood beneath. The breaking crash of stones is soon lost in the sullen reverberating plunge, and in an instant the rocks are swallowed by the whelming waters, which fling back in triumph a cloud of feathered spray; then the boiling tide subsides into rippling quietude, till again lashed into fury by another cataract of stones. And so goes on this battle between art and nature; the capacity of the sea at first appears inexhaustible, but at length man is rewarded by seeing the ledge of rock growing beneath his patient assiduity.

The average breadth of this foundation is 260 feet; but the breadth of the breakwater at the top—ten feet above highwater-mark—will be 28 feet 6 inches. About 400 workmen are employed on the breakwater and on the works generally, besides 800 to 1000 convicts who are entirely occupied at the quarries.

If the same rate of progress continues to be observed, the breakwater will probably be completed in three or four years from the present time.

As we retraced our steps, we stopped frequently to admire the wonderful appliances which mechanical science has brought to bear upon all engineering difficulties. Thanks to the great politeness of Mr Coode, the head engineer, we were allowed to see the model of the breakwater, and also to examine a very interesting piece of apparatus, of his own construction, a self-registering tide-gauge, which indicates every wave that breaks upon the shore.

In the premises of the office is a remarkably fine specimen of a fossil tree, some thirty feet in length, the sight of which made us determine to lose no time in examining some of those interesting remains of a former world *in situ*; accordingly, we procured a carriage to take us to the top of the island.

We returned nearly to the spot where we first landed, then passing behind Portland Castle, we found ourselves in the town of Chesil. Never was there such a quaint old place; it looked the more venerable perhaps from the fact of its being built entirely of stone—in some cases, even the roofing was of stone: this tended to give it a gray and uniform appearance; added to which, there was not a tree or shrub to be seen. The town runs some way up the hill, on either side of a street as steep almost as a roof. At one angle of the road, you look down the chimneys of houses whose door-steps you had been level with a few minutes before. Climbing laboriously up the hill, the view opens before you; and now, for the first time, you see the whole long line of the Chesil beach; the western bay lies at your feet, stretching far towards Devonshire. The prospect at this point is highly picturesque—the precipitous road, with its continental-looking old town, and to the left, broken and rugged cliffs, ending abruptly in the sea.

On gaining the summit, the first thing that struck us was the stone-carts, which are rude and primitive, and the wheels of solid wood, enormously thick. We easily found a guide to the stone-quarries, which, it should be observed, are not those used by government, which are not shewn except by an order from the secretary of state.

We found the quarries in full work. It seems that the Portland stone was first brought into repute in the time of James I. It was employed in the erection of the banqueting-house at Whitehall; St Paul's Cathedral, Blackfriars and Westminster Bridges, and the New Royal Exchange, are also built of this stone. 'The annual quantity now shipped is between 30,000 to 40,000 tons.'

Dr Buckland, Sir Henry de la Beche, and others, have made observations upon the geology of Portland. It appears that the 'dirt-bed,' as the workmen call it, is the depository of the fossilised trees. This stratum rests upon the ('good') Portland stone, which, again, has beneath it, according to Buckland, '*compact, chalky limestone with chert*,' and '*sandy limestone with chert*,' also '*rubbly beds with chert*.' The latter description, says Mr Coode, 'is the most exact;' and he adds: 'The character of this chert or flinty matter, which contains vast quantities of shells, and chiefly of the *Trigonia*, is entirely different from the chalk-flints.'

The dirt-bed, we were told, is about thirty feet in thickness, and in it are found the fossil trees of the *cycadeoides* in great numbers. 'They are partly sunk in black earth,' says Mr Webster, 'and partly covered by superjacent *calcareo-silicious slate*; from this slate, the silex to which the trees are now converted must have been derived.' Some observations of the late Andrew Cross are pertinent to this matter; he says, in a paper on *Change*: 'The island of Portland is full of fossil trees—trees whose body is converted into silica and chalcedony. This is the work of ages, and the probable cause electric transfer, by which the silica quits the soil, and is drawn up through the pores of wood.' Sir Roderick Murchison, in his *Silurian System*, thus describes the cycads as 'a beautiful class of plants between the palms and conifers, having a tall straight trunk, terminating in a magnificent crown of foliage.' And Mrs Somerville, in her *Physical Geography*, remarking on the great changes which the earth has undergone, observes of the oolitic series: 'Plants allied to the zamias and cycades of our tropical regions, many ferns and pines of the genus *araucaria*, characterised its vegetation; and the upright stems of a fossil tree at Portland shew that it had been covered with trees.' Covered with trees and plants, now exclusively the productions of tropical climes—we repeat these words with awe: what thoughts rush upon the mind as we contemplate this single fact! Now, on this sterile rock, a few stunted trees and shrubs

hardly find means of existence. In that mysterious past, waving and luxuriant foliage decked the scene with rare forms of beauty. In Sir H. de la Beche's *Geological Researches*, he traces the probable history of the portion of England of which this is a part. We have not time here to linger with the geologists in their descriptions of how, in the lapse of time, after its primal glory, the dirt-bed became an estuary of the sea, or brackish lake, where the mud, possibly, of some vast river deposited its remains of terrestrial and fresh-water creatures, and subsequent deeper depression of the area gave opportunity for the deposition of marine fossils. So go on these marvellous alternations of level; step by step, we may, and do learn to decipher more and more of the wonders of the pre-Adamite world. Such reflections read as a good moral to the plaudits of this self-glorifying age. When we build leviathan ships, throw chains which bind continents together, and pulsate with human thoughts; when we stay the ocean with a boundary, and turn the most subtle forces of nature to our bidding—let us not forget the unnumbered ages of change which this finite globe has seen; and beyond all, remember the metaphysical questions which regard time and space themselves but as conditional truth.

MY COUNTRY-HOUSE AND ITS TENANTS.

I AM the proprietor of Wythrop Place, Wythrop, Hampshire: the 'Place' being of course not any long row of ghastly plaster-of-Paris-pillared edifices built by three men and a boy in a fortnight, as one reads of in the rule of three, but a respectable mansion in the country; and I only point this out because I once received an answer to an advertisement addressed to me at 14 Wythrop Place, a mistake which I do not wish should occur again.

Living at the Place myself, for any length of time, is, however, out of the question, since I possess a brewery more than ten miles away from it, which requires my constant supervision, and my object, therefore, of course is, to get somebody else to live there. I find no great difficulty in the matter, so far as obtaining tenants; but where I fail is in convincing them that they ought to pay me rent for it. One would really imagine, to judge from their demands upon me, and their repudiation of my demand upon them, that the obligation lay upon the other side. There is a story afloat of a great theatrical manager—that is to say, of the manager of a great theatre—in connection with his treatment of dramatic authors, which strikes me as affording an excellent parallel to the case of myself and my tenants. The author arrives by appointment at the manager's place of business. His five-act tragedy has been accepted; his only doubt is whether he shall ask for it three hundred guineas, or four. 'Your piece, sir,' the great man admits, 'is fine; the situations are striking; the bad characters are sufficiently bloody, the good ones spotless as can be desired; and the general sentiments are in accordance with public opinion. Therefore, all I have to say to you is: *What will you give me to play it?*' Similarly, it would by no means surprise me should a person of easy manners and gentlemanly address call upon me any day, and, after allowing that Wythrop Place was elegantly furnished, commodiously arranged, and fit, in every respect, to accommodate himself and family, should finish his eulogium with: 'And now, sir, what will you give me to live in it?' I have had to do with numbers of candidates for my country-house who certainly entertained that view, if they did not express it, of the relation of landlord to tenant; people, who, having resided in fashionable furnished apartments in town during the season, languidly turn over the autumn leaves of the *Times* advertisement-sheet until

they find a house in the country to suit their tastes as to locality and convenience. Rent cannot be said to be a secondary object with these gentry—who are generally 'well connected,' and what the estate-agent calls 'desirable'—for it is not an object at all. They are the last persons to haggle, bless you, about a paltry thirty guineas, more or less, for the three months; the question as to whether the stable manure shall be regularly fetched as usual by Farmer Stubble, or not, is of no sort of consequence to them; they beg I will not apologise for the rather worn appearance of the druggot on the back staircase; as to the entrance-gate being indifferently hung, so that it sometimes has to be lifted before one can open it, they would not care three farthings should there be no entrance-gate at all. Why should I say three farthings, since money, much or little, seems never to enter into their thoughts. They are come down into the country to retrench, and all their modesty requires is a roomy furnished house in a pleasant neighbourhood, with a little park-land about it, and the use of a kitchen-garden—gratis.

It is very easy for the reader to say: 'This is nonsense; a man can't be expected to keep up a country-house for the gratuitous entertainment of strangers,' when he is expected to do it, as I am, year after year: or to ask me why I don't make them pay, when I can't make them. Goodness knows that I have been too shamefully treated by this class of persons, to have any delicacy about employing the very crudest means to exact my dues. May I have another country-house upon my hands, if I would not have used torture, had the constitution permitted it, upon more than one of these wretches; but there is no redress to be got anyhow. Often and often, I have set the machinery of the law in motion against them; and we all know how much it costs to start that ingenious contrivance, and how exceedingly difficult the fly-wheel of it is to stop; but nothing ever came of it, except an attorney's bill. My tenants have generally taken their departure to the continent about a week before their term is up; they write from the south of France or Northern Italy, to mention casually that their rent must 'stand over' (over what, I never could make out; certainly not over me) for a little; but to insist particularly upon some work-bag of Berlin wool, or carved wooden paper-cutter—which they have inadvertently left behind in the right-hand drawer of the table in the back drawing-room—being forwarded to them at once with the greatest precautions against its being lost. They are anxious enough about their own trumpery property, and speak of it in terms which would lead you to imagine that it was a hostage, if necessary, many degrees above the value of their debt. One very gentlemanly tenant of this kind wrote to me from a fashionable watering-place, where he intended to reside for the winter months, to say that he had been much pleased with Wythrop, and would make a point of recommending it to his friends. That individual I did manage to lay hold of. I would have spent my entire patrimony rather than that man should have been suffered to escape my vengeance. I would have violated any law, foreign or British, and had him kidnapped, wheresoever he had betaken himself, and securely handed over to other of my myrmidons as soon as he touched English soil, before he should have gone unpunished. After expending about twice the money that was owed me, I lodged this scoffing wretch, I say, in the county jail. Very likely you may have heard of it; the provincial radical newspaper had a critique upon the matter next week, headed: 'Wythrop Place and its Owner;' wherein it was first shewn that all aristocrats were blood-thirsty and heartless; and, secondly, that I was not an aristocrat by any means; concluding with some disparaging and excursive remarks upon my beer. Moreover, since I had sued

my enemy for rent for the weeks which he had passed in my house, and not for the quarter only, I subjected myself to an action for false imprisonment, and was glad to pay fifty pounds to be out of it.

As for putting in an execution or seizing for it, what is the use of that with such tenants as mine. I only cut my own throat; execute myself and seize upon my private property, with the exception of such prizes as the work-bags and the paper-cutters. All the wealth of this sort of tenant seems to consist in wearing-apparel, of which they have large quantities, but which it is not legal to make prey of; at all events, I seldom get anything. I never made more than one capture with even a tolerable success, and that one was upon the chattels of Tilly Ricketts, subsequently described in the Insolvent Court as being of no profession, and no certain dwelling-place. His baptismal name was Chantilly, but I called him Tilly for short, and because I got to be tolerably intimate with him. He was a bachelor and a sporting person, having, indeed, been unfortunately attracted to the Place by its convenience for hunting purposes; and made nothing of riding ten miles to dine with us at the brewery and returning in the evening. He would arrange in a playful manner, over the dessert, to have a cask or two of strong beer sent down to the Place, from our famous tap; and he would pay for it, he said—satirically, as I am now aware—when he paid the rent. He came upon every occasion on a new horse, and generally attended by a little pack of hounds. For Tom and Bob—two small but most ferocious terriers—he said he had refused five-and-thirty guineas. I thought he was a fool then, of course, but I have now quite a different opinion of Chantilly Ricketts. He possessed a pony, Leporello, which he affirmed to be by far the best pony then extant in this country or in the world at large—I never knew anybody with a pony, by the by, who was not prepared to affirm this—and he had been tempted, in vain it seemed, to part with this animal also for some astounding sum.

I rode over to Wythrop once during the latter portion of his residence there, and found the house turned into little better than a kennel. He was smoking a cigar, with his two favourite dogs, in the drawing-room—not that *they* were smoking just then, although they could do it, for I have seen them myself sitting up with pipes in their mouths, upon their hind-legs, like Christians—preparatory to a rat-hunt about to take place in the same apartment. He put a stop to my natural remonstrances on that occasion by saying good-humouredly: 'Well, my dear sir, I suppose a fifty-pound note will make it all right between us when I go away; and if it will not, I give you my word, you shall have a hundred; and my word is as good as my bond:' which indeed it was, exactly.

The butcher, or the grocer, or the baker, or a combination of these—for he owed everybody—put Tilly into jail without my assistance; but I, as landlord, had of course the first choice of his goods. Two horses—for seizing which I sustained actions from their legitimate owners, who had only lent them to Mr Ricketts upon trial—the celebrated pony, and the brace of wonderful dogs, fell to my share. I was shaking my fist at these latter animals, intending, however, the gesture to apply to their master rather than to themselves, when the more savage of the two, Thomas, flew at my thigh, and was disengaged from it not without great difficulty; while the pony ate his head off, or nearly so, for weeks in my stable, and was sold with his canine friends at last for fourteen pounds. All this time were Tilly's creditors appealing to me to see them righted, instigated thereto by the incarcerated Mr Ricketts himself. He told them that, with his priceless Leporello in my possession, I had absolutely become his debtor to an extent that would

cover all their bills; and he wrote me a letter to that effect, which had this very singular postscript: '*P. S.* I think it right to state, sir, that I look upon my present misfortunes as being in some sort a judgment upon me for demeaning myself by going to your house to dinner—to a brewery: none of my family, no Ricketts, from time immemorial, was ever before mixed up with anything connected with *trade*.' And this annoyed my dear wife not a little, who, I am sorry to say, is rather thin-skinned about our celebrated tap. The house at Wythrop is certainly unsuited to one of my calling; but it was left to me—and one generally takes what is left to one without apology—by my great-uncle, who never took to me kindly, and who, as I am now convinced, carried out his animosity to the very last; the unforgiving old gentleman, broken in health, moribund as indeed he was, actually extended his resentment beyond the grave, in leaving me his house in the country. He well knew, for he was a man of business, that it must needs be a hundred and fifty pounds a year out of my pocket at least, and his malice has been more than gratified.

There are respectable tenants to be got, of course; but these are in reality more expensive—they certainly take more money out of my pocket—than the people who don't pay. There is scarcely anything in the house that suits them; and where anything does, they are clamorous to have more of it. 'There are only two arm-chairs in the dining-room,' complained one of these importunates: 'where, I should like to know, is my mother-in-law to sit?' And 'more tables' was set down laconically by another among a number of items of things wanted, just as the nabob demanded his 'more curricles.' The pump is out of order, or the roof lets in the rain; the park-pallings want renewal, the drawing-room carpet is wearing into holes; the well runs dry, and requires to be dug twenty feet deeper in the summer-time; and the cistern bursts in the winter. Every new tenant has his new grievances, and every season its particular array of wants and repairs: nor does it by any means follow that I bring the Place to perfection after all, for the improvements that have been effected at a great expense to please one incomer, are the very things, perhaps, which induce his successor to demand a reduction in the rent. If tenant-right in Ireland means anything like what it has meant at Wythrop Place, it must be one of the most impertinent dictations which it ever entered into the brain of man to defend. About a twelvemonth ago, the greatest shock to my feelings as a landlord was administered, which they have as yet experienced. I had taken especial pains to insure myself against risk with this particular tenant—if I can call a man particular who stuck at nothing—not even at felony. I had carefully eschewed the aristocracy and the sporting circles, and had selected my man from among the honest and steady-going candidates of the middle class; he was a City man of the very highest respectability, who did not know a fox-hound from a harrier, which he pronounced without the 'h'; and he was, to conclude, a drysalter, and his name was Stubbs. The estate-agent referred me to this gentleman's own place of business in London, as a guarantee of his solvency; and, indeed, it was a magnificent establishment. Moreover, the good simple fellow had never put his nose in a country-house before, so that he would not have known what was wanting, even had not everything been as complete as it was. This model-tenant kept a most respectable cob, which was supplied with hay from my own rick at a very moderate cost, for I am not the man in these sort of cases to be left behindhand in liberality. If there had been a breath of suspicion—which there, of course, was not—regarding Mr Stubbs's honesty, one glance at that cob would have left its proprietor spotless and unsullied. It seemed, as Tilly Ricketts would

have said, to have been got by Respectability out of Decorum, and to answer in itself for the unimpeachable integrity of breeder, trainer, owner, and all that had had anything to do with it. Mr Stubbs was elected churchwarden before he had been my tenant five months, entirely upon the merits of that cob.

One afternoon, my eldest son, who is a sharp lad, and has been admitted as a partner into our concern, being up in the City about hops, thought he would just take a look at the establishment of Stubbs & Company, to see how matters were going on in that quarter. Imagine his horror when he saw the shutters up, and 'To Be Sold' in great, staring characters all over them. 'I thought, father,' said he, 'when I read these words, that they would have some application to us.' And so, in truth, they had. The very day preceding his London failure, Mr Stubbs and family left their country-house at Wythrop for I-wish-I-could-find-out-what-place. He previously committed the felonious act of selling my entire hayrick, and walked away with the proceeds; he rode away, that is, upon the respectable cob; and is now, I have little doubt, upon the strength of it, churchwarden somewhere else. All I know of him or his, is this: I had the pleasure of reading in the *Times* newspaper of September last, the following announcement, which is, I think, under the circumstances, unique and cool even for a tenant: 'On Friday last, at Pau in the Pyrenees, the Viscount Cavalcantissimo to Louisa, daughter of Joseph Stubbs, Esq., late of Wythrop House, Wythrop, Hants.'

WHAT HAS BECOME OF THE GROUSE?

'First of February, partridge and pheasant shooting ends.' This is the business-like announcement in the almanac, which informs those who are not addicted to *Bell's Life* or the *Field*, that the close of the sportsman's year has arrived—grouse, black-cock, and ptarmigan shooting having ended on the 10th of December. This, therefore, is the appropriate time to make a few remarks on the cry of the sportsmen as to the grouse and other game-birds: 'Where are they?' which was answered only by the iteration of the moorland echo—Where are they? Sportsmen look forward with dread to the extirpation of their favourite birds; and other interested classes, including landlords, game-dealers, &c., tremble for their profits; while the naturalist shrinks from an impending addition to the already numerous catalogue of extinct British birds. The alarm is not unreasonable: in another generation, the descendants of the industrious sportsmen who flourished in the reign of Queen Victoria, may perhaps be found sighing over a stuffed grouse, or examining with regretful eye the skeleton of a partridge or the portrait of a black-cock in the natural history department of the British Museum; where, at the same time, if we may rely upon the prophecies of Mr John Cleghorn, visitors will be shewn drawings of the *Clupea harengus*, the salmon, and many other extinct but recent species of our British fishes, accompanied, in all probability, with a sermon from the exhibitor, having for its moral that pithy old proverb which hints at the killing of the geese for the sake of its golden eggs. The decrease in our stock of grouse has been at intervals the cry for some years now; but the more decided failure of the shooting-season now past has reawakened public attention in earnest. In this season, our sportsmen have been unprecedentedly industrious in the pursuit of their destructive business. But their efforts, so far as grouse are concerned, have

been almost fruitless; no splendid bags have resulted; the Highland sheltie has had no great burden to carry home to the quarters in the glen. Mile after mile of wild mountain heath has the wearied sportsman trod in vain. Mountains have been skirted, bogs forded, or still more cleverly avoided, but the crack of his gun was unheard, and the health-giving breeze brought no scent of the bird. The silence remained unbroken by the whitter of the mountain partridge or the cry of the moorfowl; vast spaces of heather and gorse stretched before him into the far distance, and thousands of acres were wearily scanned with the glass, and as wearily measured by the foot, but scarcely a shot could be had; or perhaps—as at Dunmaglass and Aberchalder—a shooting-party of four gentlemen, practised sportsmen, might bring down—five and a half brace! The fact is avouched by the *Morning Post* early in August. 'Grouse killed on the Dunmaglass and Aberchalder Hills, Inverness-shire, August 12—Sir H. de Trafford, none; Captain F. Scott, one brace; Mr J. S. Entwistle, four brace; Mr A. de Trafford, one bird.' But even at a still later part of the season—that is, in November—grouse continue as scarce as before; and a paragraph in the *Inverness Courier*, relative to the sport in Lord Seafield's covers at Glen Urquhart, gives two grouse out of 906 head of other game which had fallen to eight guns in the course of four days. The paragraph is as follows: 'The total baggings in four days—Tuesday, Wednesday, Thursday, and Friday—were as follow: 254 pheasants, 18 partridges, 40 wood-cocks, 8 black game, 2 grouse, 129 hares, 438 rabbits, and 22 roe-deer.' Our purpose in noticing the failure of the grouse-shooting in these pages is to hint that the decreasing supplies have been attributed to wrong causes—namely, disease and destruction of eggs.

The following paragraphs, culled from the *Field* and a variety of other sources, will put the reader in possession of the common ideas as to the causes of the disease. Sportsmen are not agreed on the matter. One division of the little army of disputants attributes the malady (principally tapeworm) to the excessive heather-burning which has now become annual on some of our moors; another blames the pasturage of sheep as the sole cause. A gentleman of the name of 'Grouse,' who holds a moor of 20,000 acres, says that no disease exists upon it, and that birds are very plentiful; that on 'the 12th' sixty brace might easily have been bagged; and he attributes this large stock of healthy birds mainly to the ground being clear of sheep, and that there is no heather-burning, in order to admit of the production of grass for the black-faces; while 'on an adjoining moor (only separated by a loch), which is 80,000 acres in extent, where burning is practised, and the ground overrun with sheep, grouse are so scarce that with hard fagging he can bag only fifteen brace in a day.' It would seem from a series of articles on the subject, that 'when sheep are in excess, which is very commonly the case now in Scotland on many moors, heather must be burned to a great extent to make room for them, and to produce fresh food, thus depriving grouse of shelter; and in the next place, as sheep are perpetually in motion, they constantly disturb the ground, and in the breeding-season unquestionably destroy nests; and in the autumn they are dressed with an ointment composed of butter, tar, and mercury. A question then arises—Whether this dressing so far affects the constitution of the sheep for the time, that the soil and herbage are influenced thereby so as to be prejudicial to grouse.' Another gentleman, who distinguishes himself as 'An Old Un,' and who seems to

have great experience in sporting matters, says: 'If the laird will favour his native tenant, and make sheep his primary object, and will not sympathise a little with his feathered friend, grouse will soon disappear off the ground, and, in my opinion, from the following causes: smearing with that abominable, poisonous, offensive-smelling grease and tar; and continually herding five or six thousand sheep, with a team of colley-dogs.' Further, the 'Old Un' says: 'Let Scotland return to its natural state, as I found it in 1832—feeding on its grouse-portsions the Highland black-faced sheep, in place of its foreign usurper the white-faced Cheviot. The black-faced requires less care, less burning of heather, less gathering and driving, less grease and tar; stains the ground less; travels less in large bodies; and with its quick eye and light and careful tread, respects the nest and eggs of his native companion.' Colonel Whyte, another authority, writes to the *Field* to say that the grouse of a district in Donegal, being afflicted with the tape-worm, is 'confirmation strong as proof of Holy Writ' that he is right in supposing that in sheep-farming and its concomitants the disease originates—especially as a Scotch sheep-farmer has lately taken possession of the land!

In another letter, the colonel tells us that 'the place a grouse loves to feed on is knolly ground, with the young short heather sprouting up; and this is precisely the spot the sheep selects for his nightly resting-place. Can we wonder, then, at the livers of grouse being diseased, feeding as they do on heather besmeared with mercury? Now, these spots are rare, either on mountains wholly burned or on mountains never burned—and under one category or the other come three parts of the Scottish hills—and, being rare, are of course much frequented by both. . . . The present breed of grouse in Scotland I believe to be for the most part thoroughly broken down in constitution, and accordingly every wet winter brings on an access of the disease; and as weakly fathers beget weakly offspring, so year by year under the present system, they will become more and more delicate.'

A series of letters have also been appearing on heather-burning, in the *Inverness Courier*; we have room, however, for but one extract on the subject. 'Veritas' thus decides in favour of the burning: 'I have lived among the hills a great many years now, and, although neither sportsman nor farmer, have had many opportunities, not only of hearing the subject of grouse-disease discussed, but also of noticing the effects of heather-burning; and feel warranted in stating, without fear of much contradiction, that the strongest and healthiest birds are invariably to be found on moors which are regularly and systematically burned.'

We need say little about the destruction of the eggs. It is certain, however, that many are destroyed—some by accident, others by poachers, who supply the dealers with them. Grouse-eggs have been largely transported to England, for experiments in stocking English moors. The *Spectator* newspaper, in a recent article, indicates still another way of disposing of the eggs: 'The birds are failing, partly from a disease which is carrying off great numbers, but there are two other causes of their disappearance. The watchers of the deer-forests, thinking only of the antlered game, dislike the grouse because they attract poachers, and destroy the eggs wherever they find them, and thus abolish one form of sport to save another. But we suspect the worse disease under which the grouse suffer is the increase in the number of sportsmen.' This last suggestion, in our opinion, points to the true cause of the scarcity of the birds, although combined in some measure with the disease; and we have not arrived at this opinion without much personal inquiry, and after the perusal of a large amount of correspond-

ence on the subject. That overshooting is the real cause of the decrease of the grouse, is sufficiently obvious even from the fact, that the rent paid for liberty to shoot grouse and deer this season was somewhere about £200,000. But even this large sum will cease to be wondered at, when the reader learns that 100,000 brace of each of the principal game-birds—grouse, partridge, pheasant, snipe—are required in London alone, reaching the metropolis in the shape of consignments to wholesale and retail dealers, and as presents to friends. If we average these as yielding the sportsman half-a-crown per brace, it gives us a sum equivalent to about a fourth of the rental. This overshooting is caused to a large extent by persons renting shooting-grounds who are unable to afford so expensive a luxury, and who therefore 'shoot like mad,' as the Ettrick Shepherd expresses it, to make up the rent—caring not whether they leave a sufficient stock of birds to multiply and replenish the earth. It has been said that

A London brewer shoots the grouse,
And a lordling stalks the deer.

But while these parties can no doubt afford to pay for grouse-shooting or deer-stalking, without the annoyance of feeling that they must reproduce the money, there is another class who make a business of the sport, and who bestow a large amount of hard work on it, in order to turn it to commercial account.

As illustrating the system of shooting for profit, we may state that we happen to know two humble but industrious men who followed this plan with great shrewdness. These men were natives of one of our Highland glens, and followed the business of what is called in Edinburgh chairmen, although their title of street-porters will be more generally understood. Roderick and Duncan had a good connection, and were well employed as messengers during the winter season, when the various courts of law are in session; but as each returning summer arrived, the brothers found that it entailed upon them a forced idleness of four or five months consequent upon 'the long vacation,' and that however busy they might have been during the winter, their earnings were insufficient to carry them over the dull months of their vacation. Having once or twice attended gentlemen to the Highlands for a few weeks' shooting about the glorious 13th, it came to pass that eventually, having made careful and accurate arrangements, they rented a shooting on their own account, and set actively to work with their own two guns, and one or two hired attendants, determined to shoot the rent out of the place and a profit besides—which they did. This is only one instance out of many. Billiard-room keepers, livery-stable keepers, and others having strong ideas of combining pleasure and business, frequently rent a moor, and of course take care not to lose by the speculation. It is perfectly clear that such sportsmen as these have little care as to whether they leave a stock of breeding-birds or not; they rarely visit the same ground twice, to make sure of obtaining value for their money, this being the only side of the question they look at. No wonder that gentlemen following these parties think they have stumbled either upon 'Glendo' or 'Glen-diddle.'

Look, too, how times are changed—how steam-boats and railways flash across the country and up to town. Formerly, there were no such rapid modes of conveyance, and game having to be sent by the mail-coach at a considerable cost of carriage, smaller quantities were consumed. Then the population has increased so considerably as to produce a proportionate demand; every year the supply augments, because every little retailer's wife must now-a-days have her occasional dinner-party, and of course, if it is in season, she will have game on the table. All this

adds to the demand; and the demand must be supplied, say the dealers; and rent must be paid, say the shooters; and we too must live, say the poachers; and so the poor grouse, in the end, pays for all.

NIGHT-VIEW OF A NEGRO TOWN.

LAST April, an African traveller favoured us with a *Photograph of a Negro Town*. It was taken, as such pictures demand, in the daytime, and shewed the place in its quiet, dreamy state, winking in the sun. He has now sent us a companion-picture, yet of another kind. The town has roused itself up, for darkness has come down; and we view by firelight the employments and recreations of the inhabitants.

The sun had reached its half-way degree from the meridian towards the horizon by the time my cicerone had fulfilled his office and taken his leave; and feeling as if I had shared in the evolutions of a field-day, I was glad to find our quarters deserted, and to throw myself into the king's gay white net hammock, which seemed specially to commend itself to my notice, as a sort of sudatory strainer. I took to it instinctively; my head and shoulders gravitated down an inclined plane in one direction, my feet followed the example in the other, and the dorsal column thus formed a luxurious curve. There was a charm, too, in the cool mellow light of the piazza, in the blandness of the atmosphere, and the dead stillness of the hour; and I felt that I was 'at home,' and cared not a straw about its want of the social element.

The hammock has decided attractions for fatigue as well as indolence, and is as great a promoter of day-dreaming as of sleep. It will not do, it is true, for a long night's stage—for the turnings and twistings of the dyspeptic, plethoric, phlegmatic, or rheumatic sleeper; but as the passage from a serious prolepsis or the pages of a dull book into a dozy 'dog-sleep' or a wholesome nap, or for a parenthetical siesta before dinner, it is unquestionably a commendable contrivance, and worthy of a more civilised origin than is commonly ascribed to it. It claims, however, to be enjoyed *al fresco*; and in this respect, whether in a warm climate, or warm weather in any climate, the couch or easy-chair has no pretensions either to its pleasantness or its sanitary virtues.

But on this occasion, after a time, a restless sense of loneliness came over me. What had become of the king and the chiefs whom I had so recently left on the spot? Ah! yes—the fourth period of daily prayer—probably so; still, very odd, all so silent; no one to be seen; nothing moving; nothing—and yet stillness itself seems audible, like the breathing of silence; a whispering of some spirit in the air, or the 'running of the sand in the great hour-glass of Time;' while those long expansive shadows, stealthily creeping, creeping over the earth, are measuring off the remnant of the day. But somewhere hereabout my conceptions must have turned a corner, for I lost sight of them. I was now in the misty regions of Queen Mab, and doing a fair bit of business in the shadowy line myself. I at length, however, acquired some vague sense of sound, like the murmuring surges of the ocean; a sense of seeing also ensued, and gradually I recognised six or eight chiefs seated about the piazza, listening with a sedate complacency to a recital of my morning adventures from my voluble attendant. As soon as he saw that my eyes were open, bang went his 'English' at me in a moment.

'Ah! *kimmerforey*, ole man,' said he, 'you slip, you slip (sleep)—fine slip, fine slip, eh?—berry fine; fine walk, fine town, fine women—berry fine, eh? yes!'

The king, seated in the piazza of his house opposite, seemed engaged in a desultory conversation with his minister and two or three other chiefs. The last beams of the retiring sun were now to be seen only

in the roseate tints of the western sky; the cows, as usual, were returning of their own accord from their pasturage, and passing, unattended, in single file, into the further yard. This little specimen of African 'routine' was quite charming; and by the time I had effectually demonstrated the efficacy of the 'cold-water remedy' in overcoming drowsiness, an odour of stewed something, with indubitable boiled rice, was borne into the house by our two handmaidens, who whisked off again with an involuntary giggle, and the king and the chiefs were once more retiring from the yard on their way to the mosque.

As the evening advanced, both piazzas resumed for a while something more of the social aspect. It seemed, however, that courtesy, or mere ceremony, with possibly a spice of unsatiated curiosity, dictated the visits, rather than a desire for interchange of ideas among the visitors themselves; and after some occasional sententious remarks, a little snuff now and then, and a listless handling of the beads which some few wore round their necks, most of them retired, and we accompanied the minister across the yard for a chit-chat with the king. But it was one of those lovely nights when external nature seems to appeal to us so irresistibly for sympathy, and to inspire at once that dreamy complacency which disposes us rather to think than to talk, and which renders it irksome, or, at least, demands something like an effort to sustain even a desultory conversation. The blue vault of heaven was studded with glittering stars; the moon, now advancing to the zenith, was mingling her silvery beams with the light of the radiant host that surrounded her; and nothing disturbed the prevailing silence but our own voices, till suddenly the distant sound of the native drum, and the low murmuring cadences of the evening-song, came upon my ears. We soon took our leave of the king, and I taxed the courtesy of the minister for his company in a walk.

While leisurely pursuing the same direction I had taken in the morning, we now met with several individuals and small groups of loquacious young women, who, in passing, exchanged some short complimentary observation with the distinguished functionary who accompanied me. The close-fitting wrappers of the damsels, with cloths over their heads, after the fashion of the *mantilla*, were sufficient to betray their sex in the equivocal light of the hour, had their voices not proclaimed it. In the meantime, the wild sounds of the drums in different quarters of the town, the simple swelling strains from the leading voices, and the lower cadences of the responsive choros, subsiding into a murmur, gradually became more and more distinct. The patches of light, that gleamed here and there, flickered brighter and brighter against the lower region of the sky, and brought a large portion of the high funnel-shaped roofs, the interjacent trees, and especially the tall palms with their crested heads, into bold relief. The nearest fire was now close at hand. Its glowing light streamed through the open doorways of the *zadings* across the street as we approached, but here, neither sound of drum nor of voices was to be recognised. Voices, however, came upon my ears simultaneously with the sudden glare upon my sight as we entered the yard, and I beheld in the centre of it a dark group of figures surrounding the flames and transient bright sparks that waywardly flickered and glittered in the fantastic folds of the smoke that was spreading its gloomy canopy above their heads. They were all seated in close order upon the ground, forming a complete circle; but the monotonous jabbering of their voices, as well as the sedateness of their demeanour, gave no indication of hilarity. Possibly, it was some religious ceremony, some nocturnal freak of superstition to which their attention seemed riveted by the earnestness of their credulity—some propitiatory worship, perhaps, of the

element which awes while it cheers and fascinates. Such might have been the inference in the mind of a stranger, from the character of the scene on first entering the yard; the fire materially increasing in effect the proportions of the dark opaque group of figures around it, as well as of the towering conical roofs of the adjacent buildings; whilst the details of the enclosure below, thrown into obscurity by their lengthened shadows, conspired to create that mysterious solemnity which seemed to have settled upon the spot.

On approaching the circle, however, I found that it was composed of between twenty and thirty boys, varying in their ages from eight to sixteen, with one adult only—an elderly man of spare figure and attenuated limbs, with a long triangular-shaped visage, high cheek-bones, small deep-set eyes, peering from under the eaves of a high projecting forehead, and a bristling crop of white stubble covering his chin, and contrasting strangely with the other swarthy features. Our presence caused no interruption to the steadfastness of their purpose, whatever it might be. The old gentleman raised his head, and then rounded his shoulders a little more into a bend of courtesy; but the jabbering still went on among the youngsters. At length one of the boys suddenly raised his voice and pointed to another; a short pause ensued, and something that seemed a brief admonition having come from the old president, on they went again. A similar interruption occurred again and again, till at length the fire began to languish, and a youngster jumped up, hurried to a heap of dried sticks, tied in separate small bundles, and was again squatting and jabbering in his place as the fire began to feed on his donation. The young tyros, it appeared, were graduating in the mazes of that Mohammedan treasury of knowledge called the Koran, and rehearsing the task of the night. Whenever a boy made a slip in a word or pronunciation, he was checked by another boy, the old preceptor having a manuscript portion of the Book before him; and the boys seemed pretty eager in their watch upon one another. In short, the scene before us was a school. The sons of different neighbours were in class with the sons of the owner or occupier of the premises; and in this way the several *karamojahs*, or schoolmasters, within the town attend their classes—each boy always providing a bundle of wood to maintain the fire.

'But why,' I inquired of my companion, 'make night the period of tuition?'

'Oh, day made for work,' he replied. 'Some boys have school by fire in the morning too, before sunrise.'

How very little idea have we in England of anything like schooling or education going on among the negro tribes of Africa, saving that which is exclusively the work of our own missionaries! How remote from all our conceptions of their general character, habits, and aspirations, is the fact that 'learning' is held in high estimation, and forms a claim to distinction and respect; that Arabic is studied in public schools of wide repute in the heart of Nigritia, or the land of the negroes, within a few degrees of the equator; and that, among the swarthy natives, men are to be met with as well versed in Biblical history as the generality of laymen in England, and who are familiar also with two or three languages besides their own. It is true that their intellectual pursuits and acquirements are not very profound, and that elementary instruction is pretty much limited to reading and writing; but this is precisely the case with Mohammedan nations or tribes in general. The fact, however, appears to be little known, or little regarded, that the deism of Mecca is fast gaining ground upon the fetishism of the pagans, and exercising a powerful influence upon the social and moral condition of the negro tribes of these regions.

But our attention was not wholly directed to the

boys. We found several men of different ages now assembled in the piazzas of two or three of the houses within the yard; either seated or occupying a hammock, and interchanging their ideas on current or traditional events. Their great dependence upon tradition causes them to indulge habitually in retrospection, and in lauding the auspicious events of departed days. But our visit served to concentrate for a while their speculations on the passing present, with which I was specially identified, and more especially on the very odd notion of my coming among them only to 'see the country' and 'say how do?' This puzzled them; they could not make it out; they shook their heads, and pondered; and took snuff—the only form in which they use tobacco—to clear their perceptions. But distant sounds were inviting us in another direction; so, after shaking hands, and receiving their compliments, we left them with an interesting subject to dilate upon, and work out a solution at their leisure.

After passing out of the yard into the street, we were soon again within the range of light from the next fire. The sound of drums and voices broke upon our ears, and another interesting picture opened before us. Here, too, a living circle of some fifty or sixty individuals was formed in the middle of the yard, the fire being at one side. The circle was composed chiefly of young men and women standing intermingled, with the drummer seated on one side of the fire *tum-tum-a-rumming* with an air of great self-sufficiency, whilst two young fellows were flinging themselves into angular attitudes as they whirled round within the area; eliciting, as it seemed, in a long measured strain, the extempore criticisms of the drummer as the leader, and the chorus accompaniment of the surrounding company. But our arrival, as soon as it was observed, at once changed the burden of the strain; the drum-sticks announced the transition in a brief rattling flourish, and opened a gap for the running commentary that ensued on the welcome we were entitled to, and the attributes we were respectively presumed to possess—quite a burden in themselves. Comparatively few of the company composed the *corps de ballet*, although all were numbered among the vocal performers. The dancing was, indeed, rather of the impulsive or *ad libitum* order—as devoid of any fixed principles or rules as of what we would call grace—the turning the toes inward, for instance, was awful, and even impulse itself was now and then kept in check, or became ludicrously confounded with something like *mauvaise honte*, or sheer incapacity for its work. The commonest achievement was that of a young fellow jumping straight across the ring, and figuring for a moment or two before an opposite damsel, as an invitation or challenge to draw her out. In this he was generally unsuccessful, and he returned jumping disconsolately to his place. Two of the more accomplished and self-sufficient of the young men at length began to display their powers; and a damsel followed the example, although disdainfully, seeming to figure about with an air of independence, and eyeing the capering gallants askance, as if to say: 'Wha' you want? Gö löng—le'v me löne!' Inspiring applause was of course accorded to her by the audience, which had now somewhat increased, and those of the number who composed the front row had squatted upon the ground. The leader of the 'band' was here relieved by another, fresh and vigorous for the task; and this change was effected so quickly, that there was no palpable pause in the action of the drum-sticks. Another rattling flourish, and another leading voice, with some appropriate morsel of vocal sentiment, proclaimed the inauguration of the new conductor. To the responsive voices of the spectators was now added a general clapping of hands with one sharp simultaneous blow in unison with the time; the drum itself spoke out with a more impressive *staccato*

intonation, and the fire, responding cheerfully to a poke, illumined the scene with a brighter gleam; while the 'dancers,' sidling and wheeling, and wriggling and kicking, and sprawling, were of course the observed of all observers. This went on for some time—the dancing, the drumming, and the applause growing faster and more furious—till one of the damsel's competitors, springing with one bound clean over the fire, as the only point of egress, disappeared from the scene with the dexterity of a harlequin. The scene had now reached its climax. The drum-sticks suddenly relaxed into a staggering rattle, and the performance was at an end. We now, for the first time, became conscious that we had been working away sympathetically with our head and shoulders, and with something like that impulsiveness with which a rider in a prodigious hurry finds himself striving to get ahead of his horse. No wonder the sedate companion of my evening ramble had disappeared; and on looking round, I confronted instead my incorrigible eulogist who had attended me in the morning, his 'English' of course effervescing in a moment. 'Ah! *kummerforey*,' cried he, 'ole man, you dance, eh? Fine dance, fine dance—berry fine; fine gal, fine gal—berry fine, eh? yes!'

O C E O L A :

A ROMANCE.

CHAPTER XX.—FRONTIER JUSTICE.

I WAS not allowed long to enjoy the sweets of home. A few days after my arrival, I received an order to repair to Fort King, the Seminole agency, and headquarters of the army of Florida. General Clinch there commanded. I was summoned upon his staff.

Not without chagrin, I prepared to obey the order. It was hard to part so soon from those who dearly loved me, and from whom I had been so long separated. Both mother and sister were overwhelmed with grief at my going. Indeed, they urged me to resign my commission, and remain at home.

Not unwillingly did I listen to their counsel: I had no heart in the cause in which I was called forth; but at such a crisis I dared not follow their advice: I should have been branded as a traitor—a coward. My country had commissioned me to carry a sword. I must wield it, whether the cause be just or unjust—whether to my liking or not. This is called *patriotism*!

There was yet another reason for my reluctance to part from home. I need hardly declare it. Since my return, my eyes had often wandered over the lake—often rested on that fair island. Oh, I had not forgotten her!

I can scarcely analyse my feelings. They were mingled emotions. Young love triumphant over older passions—ready to burst forth from the ashes that had long shrouded it—young love penitent and remorseful—doubt, jealousy, apprehension. All these were active within me.

Since my arrival, I had not dared to go forth. I observed that my mother was still distrustful. I had not dared even to question those who might have satisfied me. I passed those few days in doubt, and at intervals under a painful presentiment that all was not well.

Did Maimee still live? Was she true? True! Had she reason? Had she ever loved me?

There were those near who could have answered the first question; but I feared to breathe her name, even to the most intimate.

Bidding adieu to my mother and sister, I took the route. These were not left alone: my maternal uncle—their guardian—resided upon the plantation. The parting moments were less bitter, from the belief that I should soon return. Even if the anticipated campaign should last for any considerable length of time, the scene of my duties would lie near, and I should find frequent opportunities of revisiting them.

My uncle scouted the idea of a campaign, as so did every one. 'The Indians,' he said, 'would yield to the demands of the commissioner. Fools, if they didn't!'

Fort King was not distant; it stood upon Indian ground—fourteen miles within the border, though further than that from our plantation. A day's journey would bring me to it; and in the company of my cheerful 'squire,' Black Jake, the road would not seem long. We bestrode a pair of the best steeds the stables afforded, and were both armed *cap-à-pié*.

We crossed the ferry at the upper landing, and rode within the 'reserve.*' The path—it was only a path—ran parallel to the creek, though not near its banks. It passed through the woods, some distance to the rear of Madame Powell's plantation.

When opposite to the clearing, my eyes fell upon the diverging track. I knew it well: I had oft trodden it with swelling heart.

I hesitated—halted. Strange thoughts careered through my bosom; resolves half-made, and suddenly abandoned. The rein grew slack, and then tightened. The spur threatened the ribs of my horse, but failed to strike.

'Shall I go? Once more behold her? Once more renew those sweet joys of tender love? Once more—Ha, perhaps it is too late! I might be no longer welcome—if my reception should be hostile? Perhaps!'

'Wha' you doin dar, Masser George? Daat's not tha road to tha fort.'

'I know that, Jake; I was thinking of making a call at Madame Powell's plantation.'

'Mar'm Pow'll plantayshun! Gollys! Masser George—daat all you knows 'bout it?'

'About what?' I inquired with anxious heart.

'Dar's no Mar'm Pow'll da no more; nor hain't a been, since better 'n two year—all gone clar 'way.'

'Gone away? Where?'

'Daat dis chile know nuffin 'bout. S'pose da gone some other lokayshun in da rezav; made new clarin somewha else.'

'And who lives here now?'

'Dar ain't neery one lib tha now: tha ole house am deserted.'

'But why did Madame Powell leave it?'

'Ah—daat am a quaw story. Gollys! you nebber hear um, Masser George?'

'No—never.'

'Den I tell um. But s'pose, masser, we ride on. 'T am a gettin' a leetle lateish, an' 'twont do nobow to be catch arter night in tha woods.'

I turned my horse's head, and advanced along the main road, Jake riding by my side. With aching heart, I listened to his narrative.

'You see, Masser George, 'twar all o' Masser Ringgol—tha ole boss† daat am—an' I b'lieve tha young 'un had 'im hand in dat pie, all same, like tha ole 'un. Waal, you see Mar'm Pow'll she loss some niggas dat war ha slaves. Dey war stole from ha, an' wuse dan stole. Dey war tuk, an' by white men, masser. Tha be folks who say dat Mass' Ringgol—he know'd more 'n anybody else 'bout tha whole bizness. But da rubb'ry war blamed on Ned Spence an' Bill William. Waal,

* That portion of Florida reserved for the Seminoles by the treaty of Camp Moutrie, made in 1823. It was a large tract, and occupied the central part of the peninsula.

† Master or proprietor; universally in use throughout the Southern States. From the Dutch 'baas.'

Mar'm Pow'll she go to da law w' dis yar Ned an' Bill; an' she 'poy Masser Grubb tha big lawyer dat lib down tha ribba. Now Masser Grubb, he great friend o' Masser Ringgol, an' folks do say dat boaf de two put tha heads together to cheat dat ar Indy-en 'ooman.'

'How?'

'Dis chile don't say for troof, Masser George; he hear um only from da brack folks; tha white folk say diff'rent. But I hear um from Mass' Ringgol's own nigga woodman—Pomp, you know, Masser George? an' he say dat them ar two bosses did put tha heads together to cheat dat poor Indy-en 'ooman.'

'In what way, Jake?' I asked impatiently.

'Waal, you see, Masser George, da lawya he want da Indy-en sign ha name to some paper—power ob 'turney, tha call um, I b'lieve. She sign; she no read tha writin. Whugh! daat paper war no power ob 'turney: it war what tha lawyas call a "bill ob sale."'

'Ha!'

'Yes, Masser George, dat's what um war; an' by dat same bill ob sale all Mar'm Pow'll's niggas an' all ha plantation-clarin war made ober to Masser Grubb.'

'Atrocious scoundrel!'

'Masser Grubb he swar he bought 'em all, an' paid for 'em in cash dollar. Mar'm Pow'll she swar de berry contry. Da judge he decide for Masser Grubb, 'kase great Masser Ringgol he witness; an' folks do say Masser Ringgol now got dat paper in um own safe keepin', an' war at tha bottom ob tha whole bizness.'

'Atrocious soundrels! oh, villains! But tell me, Jake, what became of Madame Powell?'

'Shortly arter, tha all gone 'way—nob'dy know wha. Da mar'm haself an' dat fine young fellur you know, an' da young Indy-en gal dat ebberybody say war so good-lookin'—yes, Masser George, tha all gone 'way.'

At that moment an opening in the woods enabled me to catch a glimpse of the old house. There it stood in all its gray grandeur, still embowered in the midst of beautiful groves of orange and olive. But the broken fence—the tall weeds standing up against the walls—the shingles here and there missing from the roof—all told the tale of ruin.

There was ruin in my heart, as I turned sorrowing away.

CHAPTER XXI.

INDIAN SLAVES.

It never occurred to me to question the genuineness of Jake's story. What the 'black folks' said was true; I had no doubt of it. The whole transaction was redolent of the Ringgolds and lawyer Grubbs—the latter a half-planter, half-legal practitioner of indifferent reputation.

Jake further informed me that Spence and Williams had disappeared during the progress of the trial. Both afterwards returned to the settlement, but no ulterior steps were taken against them, as there was no one to prosecute!

As for the stolen negroes, they were never seen again in that part of the country. The robbers had no doubt carried them to the slave-markets of Mobile or New Orleans, where a sufficient price would be obtained to remunerate Grubbs for his professional services, as also Williams and Spence for theirs. The land would become Ringgold's, as soon as the Indians could be got out of the country—and this was the object of the 'bill of sale.'

A transaction of like nature between white man and white man would have been regarded as a grave swindle, an atrocious crime. The whites affected not to believe it; but there were some who knew it to be true, and viewed it only in the light of a clever ruse!

That it was true, I could not doubt. Jake gave me

reasons that left no room for doubt; in fact, it was only in keeping with the general conduct of the border adventurers towards the unfortunate natives with whom they came in contact.

Border adventurers, did I say? Government agents, members of the Florida legislature, generals, planters, rich as Ringgold, all took part in similar speculations. I could give names. I am writing truth, and do not fear contradiction.

It was easy enough, therefore, to credit the tale. It was only one of twenty similar cases of which I had heard. The acts of Colonel Gad Humphreys, the Indian agent—of Major Phagan, another Indian agent—of Dexter, the notorious negro-stealer—of Floyd—of Douglass—of Robinson and Millburn, are all historic—all telling of outrages committed upon the suffering Seminole. A volume might be filled detailing such swindles as that of Grubbs and Ringgold. In the mutual relations between white man and red man, it requires no skilful advocate to shew on which side must lie the wrongs unrepaired and unavenged. Beyond all doubt, the Indian has ever been the victim.

It is needless to add that there were retaliations: how could it be otherwise?

One remarkable fact discloses itself in these episodes of Floridian life. It is well known that slaves thus stolen from the Indians *always returned to their owners whenever they could!* To secure them from finding their way back, the Dexters and Douglasses were under the necessity of taking them to some distant market, to the far 'coasts' of the Mississippi—to Natchez or New Orleans.

There is but one explanation of this social phenomenon; and that is, that the slaves of the Seminole were *not* slaves. In truth, they were treated with an indulgence to which the helot of other lands is a stranger. They were the agriculturists of the country, and their Indian master was content if they raised him a little corn—just sufficient for his need—with such other vegetable products as his simple *cuisine* required. They lived far apart from the dwellings of their owners. Their hours of labour were few, and scarcely compulsory. Surplus product was their own; and in most cases they became rich—far richer than their own masters, who were less skilled in economy. Emancipation was easily purchased, and the majority were actually free—though from such chains it was scarcely worth while to escape. If slavery it could be called, it was the mildest form ever known upon earth—far differing from the abject bondage of Ham under either Shem or Japheth.

It may be asked how the Seminoles became possessed of these black slaves? Were they 'runaways' from the States—from Georgia and the Carolinas, Alabama, and the plantations of Florida? Doubtless a few were from this source; but most of the runaways were not claimed as property; and, arriving among the Indians, became free. There was a time when by the stern conditions of the Camp Moultrie Covenant these 'absconding' slaves were given up to their white owners; but it is no discredit to the Seminoles, that they were always *remiss* in the observance of this disgraceful stipulation. In fact, it was not always possible to surrender back the fugitive negro. Black communities had concentrated themselves in different parts of the reserve, who under their own leaders were socially free, and strong enough for self-defence. It was with these that the runaway usually found refuge and welcome. Such a community was that of 'Harry' amidst the morasses of Pease Creek—of 'Abram' at Micosanky—of 'Charles' and the 'mulatto king.'

No; the negro slaves of the Seminoles were not runaways from the plantations; though the whites would wish to make it appear so. Very few were of this class. The greater number was the 'genuine

property' of their Indian owners, so far as a slave can be called *property*. At all events, they were *legally* obtained—some of them from the Spaniards, the original settlers, and some by fair purchase from the American planters themselves.

How purchased? you will ask. What could a tribe of savages give in exchange for such a costly commodity? The answer is easy. Horses and horned cattle. Of both of these the Seminoles possessed vast herds. On the evacuation by the Spaniards, the savannas swarmed with cattle, of Andalusian race—half-wild. The Indians caught and reclaimed them—became their owners.

This, then, was the *quid pro quo*—quadrupeds in exchange for bipeds!

The chief of the crimes charged against the Indians was the *stealing of cattle*—for the white men had their herds as well. The Seminoles did not deny that there were bad men among them—lawless fellows difficult to restrain. Where is the community without scamps?

One thing was very certain. The Indian chiefs, when fairly appealed to, have always evinced an earnest desire to make restoration: and exhibited an energy in the cause of justice, entirely unknown upon the opposite side of their border.

It differed little how they acted, so far as regarded their character among their white neighbours. These had made up their mind that the dog should be hanged; and it was necessary to give him a bad name. Every robbery, committed upon the frontier, was of course the act of an Indian. White burglars had but to give their faces a coat of Spanish brown, and justice could not see through the paint.

CHAPTER XXII.

A CIRCUITOUS TRANSACTION.

Such were my reflections as I journeyed on—suggested by the sad tale to which I had been listening.

As if to confirm their correctness, an incident at that moment occurred, exactly to the point.

We had not ridden far along the path, when we came upon the tracks of cattle. Some twenty head must have passed over the ground, going in the same direction as ourselves—towards the Indian 'reserve.'

The tracks were fresh—almost quite fresh. I was tracker enough to know that they must have passed within the hour. Though cloistered so long within college walls, I had not forgotten all the forest-craft taught me by young Powell.

The circumstance of thus coming upon a cattle-trail, fresh or old, would have made no impression upon me. There was nothing remarkable about it. Some Indian herdsmen had been driving home their flock; and that the drivers were Indians, I could perceive by the moccasin prints in the mud. It is true, some frontiers-men wear the moccasin; but these were not the footprints of white men. The turned-in toes,* the high instep, and other trifling signs which, from early training, I knew how to translate, proved that the tracks were Indian.

So were they, agreed my groom, and Jake was no 'slouch' in the ways of the woods. He had all his life been a keen 'coon-hunter—a trapper of the swamp-hare, the 'possum, and the 'gobbler.' Moreover, he had been my companion upon many a deer-hunt—many a chase after the gray fox, and the rufous 'cat.' During my absence he had added greatly to his experiences. He had succeeded his former rival in the post of woodman, which brought him daily in contact with the denizens of the forest, and constant observation of their habits had increased his skill.

* It is art, not nature, that causes this peculiarity; it is done in the cradle.

It is a mistake to suppose that the negro brain is incapable of that acute reasoning which constitutes a cunning hunter. I have known black men who could read 'sign' and lift a trail with as much intuitive quickness as either red or white. Black Jake could have done it.

I soon found that in this kind of knowledge he was now my master; and, almost on the instant, I had cause to be astonished at his acuteness.

I have said that the sight of the cattle-tracks created no surprise in either of us. At first it did not; but we had not ridden twenty paces further, when I saw my companion suddenly rein up, at the same instant giving utterance to one of those ejaculations peculiar to the negro thorax, and closely resembling the 'wugh' of a startled hog.

I looked in his face. I saw by its expression that he had some revelation to make.

'What is it, Jake?'

'Golly! Massr George, d' you see daat?'

'What?'

'Daat down dar.'

'I see a ruck of cow-tracks—nothing more.'

'Doant you see dat big 'un?'

'Yea—there is one larger than the rest.'

'By Gosh! it am de big ox Ballface—I know um track anywha—many's the load o' cyrress log dat ar ox hab toated for ole massr.'

'What? I remember Baldface. You think the cattle are ours?'

'No, Massr George—I 'spect tha be da lawya Grubb's cattle. Ole massr sell Ballface to Massr Grubb more'n a year 'go. Daat am Bally's track for sartin.'

'But why should Mr Grubb's cattle be here in Indian ground, and so far from his plantation?—and with Indian drivers, too?'

'Dat ere's jest what dis chile can't clary make out, Massr George.'

There was a singularity in the circumstance that induced reflection. The cattle could not have strayed so far of themselves. Their voluntary swimming of the river was against such a supposition. But they were not *straying*; they were evidently *conducted*—and by Indians. Was it a *raid*?—were the beeves being stolen?

It had the look of a bit of thievery, and yet it was not crafty enough. The animals had been driven along a frequented path certain to be taken by those in quest of them; and the robbers—if they were such—had used no precaution to conceal their tracks.

It looked like a theft, and it did not; and it was just this dubious aspect that stimulated the curiosity of my companion and myself—so much so, that we made up our minds to follow the trail, and if possible ascertain the truth.

For a mile or more, the trail coincided with our own route; and then turning abruptly to the left, it struck off towards a track of 'hommock' woods.

We were determined not to give up our intention lightly. The tracks were so fresh, that we knew the herd must have passed within the hour—within the quarter—they could not be distant. We could gallop back to the main road, through some thin pine-timber we saw stretching away to the right; and, with these reflections, we turned head along the cattle-trail.

Shortly after entering the dense forest, we heard voices of men in conversation, and at intervals the routing of oxen.

We alit, tied our horses to a tree, and moved forward afoot.

We walked stealthily and in silence, guiding ourselves by the sounds of the voices, that kept up an almost continual clatter. Beyond a doubt, the cattle whose bellowing we heard were those whose tracks we had been tracing; but equally certain was it, that the voices we now listened to were *not* the voices of those who had driven them!

It is easy to distinguish between the intonation of an Indian and a white man. The men whose conversation reached our ears were whites—their language was our own, with all its coarse embellishments. My companion's discernment went beyond this—he recognised the individuals.

'Golly! Massar George, it ar tha two dam ruffins—Spence and Bill William!'

Jake's conjecture proved correct. We drew closer to the spot. The evergreen trees concealed us perfectly. We got up to the edge of an opening; and there saw the herd of beeves, the two Indians who had driven them, and the brace of worthies already named.

We stood under cover watching and listening; and in a very short while, with the help of a few hints from my companion, I comprehended the whole affair.

Each of the Indians—worthless outcasts of their tribe—was presented with a bottle of whisky and a few trifling trinkets. This was in payment for their night's work—the plunder of lawyer Grubbs's pastures.

Their share of the business was now over; and they were just in the act of delivering up their charge as we arrived upon the ground. Their employers, whose droving bout was here to begin, had just handed over their rewards. The Indians might go home and get drunk: they were no longer needed. The cattle would be taken to some distant part of the country—where a market would be readily found—or, what was of equal probability, they would find their way back to lawyer Grubbs's own plantation, having been rescued by the gallant fellows Spence and Williams from a band of Indian rievors! This would be a fine tale for the plantation fireside—a rare chance for a representation to the police and the powers.

Oh, those savage Seminole robbers! they must be got rid of—they must be 'moved' out.

As the cattle chanced to belong to lawyer Grubbs, I did not choose to interfere. I could tell my tale elsewhere; and, without making our presence known, my companion and I turned silently upon our heels, regained our horses, and went our way reflecting.

I entertained no doubt about the justness of our surmise—no doubt that Williams and Spence had employed the drunken Indians—no more that lawyer Grubbs had employed Williams and Spence, in this circuitous transaction.

The stream must be muddled upward—the poor Indian must be driven to desperation.

CHAPTER XXIII.

REFLECTIONS BY THE WAY.

At college, as elsewhere, I had been jeered for taking the Indian side of the question. Not unfrequently was I 'twitted' with the blood of poor old Powhatan, which, after two hundred years of 'whitening,' must have circulated very sparsely in my veins. It was said I was not *patriotic*, since I did not join in the vulgar clamour, so congenial to nations when they talk of an enemy.

Nations are like individuals. To please them, you must be as wicked as they—feel the same sentiment, or speak it—which will serve as well—affect like loves and hates; in short, yield up independence of thought, and cry 'crucify' with the majority.

This is the world's man—the patriot of the time.

He who draws his deductions from the fountain of truth, and would try to stem the senseless current of a people's prejudgments, will never be popular during life. Posthumously he may, but not this side the grave. Such need not seek the 'living fame' for which yearned the conqueror of Peru: he will not find it. If the true patriot desire the reward of glory, he must look for it only from posterity—long after his 'mouldering bones' have rattled in the tomb.

Haply there is another reward. The *mens conscia recti* is not an idle phrase. There are those who esteem it—who have experienced both sustenance and comfort from its sweet whisperings.

Though sadly pained at the conclusions to which I was compelled—not only by the incident I had witnessed, but by a host of others lately heard of—I congratulated myself on the course I had pursued. Neither by word nor act, had I thrown one feather into the scale of injustice. I had no cause for self-accusation. My conscience cleared me of all ill-will towards the unfortunate people, who were soon to stand before me in the attitude of enemies.

My thoughts dwelt not long on the general question—scarcely a moment. That was driven out of my mind by reflections of a more painful nature—by the sympathies of friendship, of love. I thought only of the ruined widow, of her children, of Maimee. It were but truth to confess that I thought only of the last; but this thought comprehended all that belonged to her. All of hers were endeared, though she was the centre of the endearment.

And for all I now felt sympathy, sorrow—ay, a far more poignant bitterness than grief—the ruin of sweet hopes. I scarcely hoped ever to see them again.

Where were they now? Whither had they gone? Conjectures, apprehensions, fears, floated upon my fancy. I could not avoid giving way to dark imaginings. The men who had committed that crime were capable of any other, even the highest known to the calendar of justice. What had become of these friends of my youth?

My companion could throw no light on their history after that day of wrong. He 'sposed that had move off to some oder clarin in da Indy-an rezav, for folks nebba heern o' um nebber no more arterward.'

Even this was only a conjecture. A little relief to the heaviness of my thoughts was imparted by the changing scene.

Hitherto we had been travelling through a pine-forest. About noon we passed from it into a large tract of hommock, that stretched right and left of our course. The road or path we followed ran directly across it.

The scene became suddenly changed as if by a magic transformation. The soil under our feet was different, as also the foliage over our heads. The pines were no longer around us. Our view was interrupted on all sides by a thick frondage of evergreen trees—some with broad shining coriaceous leaves, as the magnolia that here grew to its full stature. Alongside it stood the live-oak, the red mulberry, the Bourbon laurel, iron-wood, *Halesia* and *Callicarpa*, while towering above all rose the cabbage-palm, proudly waving its plumed crest in the breeze, as if saluting with supercilious nod its humbler companions beneath.

For a long while we travelled under deep shadow—not formed by the trees alone, but by their parasites as well—the large grape-vine loaded with leaves—the coiling creepers of *smilax* and *hedera*—the silvery tufts of *tillandsia* shrouded the sky from our sight. The path was winding and intricate. Prostrate trunks often carried it in a circuitous course, and often was it obstructed by the matted trellis of the muscadine, whose gnarled limbs stretched from tree to tree like the great stay-cables of a ship.

The scene was somewhat gloomy, yet grand and impressive. It chimed with my feelings at the moment; and soothed me even more than the airy open of the pine-woods.

Having crossed this belt of dark forest, near its opposite edge we came upon one of these singular ponds already described—a circular basin surrounded by hillocks and rocks of testaceous formation—an extinct water-volcano. In the barbarous jargon of

the Saxon settler, these are termed 'sinks,' though most inappropriately, for where they contain water, it is always of crystalline brightness and purity.

The one at which we had arrived was nearly full of the clear liquid. Our horses wanted drink—so did we. It was the hottest hour of the day. The woods beyond looked thinner and less shady. It was just the time and place to make halt; and, dismounting, we prepared to rest, and refresh ourselves.

Jake carried a capacious haversack, whose distended sides—with the necks of a couple of bottles protruding from the pouch—gave proof of the tender solicitude we had left behind us.

The ride had given me an appetite, the heat had caused thirst; but the contents of the haversack soon satisfied the one, and a cup of claret, mingled with water from the cool calcareous fountain, gave luxurious relief to the other.

A cigar was the natural finish to this *al fresco* repast; and, having lighted one, I lay down upon my back, canopied by the spreading branches of an umbrageous magnolia.

I watched the blue smoke as it curled upward among the shining leaves, causing the tiny insects to flutter away from their perch.

My emotions grew still—thought became lull within my bosom—the powerful odour from the coral cones and large wax-like blossoms added its narcotic influences; and I fell asleep.

CHAPTER XXIV.

A STRANGE APPARITION.

I had been but a few minutes in this state of unconsciousness, when I was awakened by a plunge, as of some one leaping into the pond. I was not startled sufficiently to look around, or even to open my eyes.

'Jake is having a dip,' thought I; 'an excellent idea—I shall take one myself presently.'

It was a wrong conjecture. The black had not leaped into the water, but was still upon the bank near me, where he also had been asleep. Like myself, awakened by the noise, he had started to his feet; and I heard his voice, crying out:

'Lor, Masser George! looker dar!—ain't he a big un? Whugh!'

I raised my head and looked toward the pond. It was not Jake who was causing the commotion in the water—it was a large alligator.

It had approached close to the bank where we were lying; and, balanced upon its broad breast, with muscular arms and webbed feet spread to their full extent, it was resting upon the water, and eyeing us with evident curiosity. With head erect above the surface, and tail stiffly 'cocked' upward, it presented a comic, yet hideous aspect.

'Bring me my rifle, Jake!' I said, in a half-whisper. 'Tread gently, and don't alarm it!'

Jake stole off to fetch the gun; but the reptile appeared to comprehend our intentions—for, before I could lay hands upon the weapon, it revolved suddenly on the water, shot off with the velocity of an arrow, and dived into the dark recesses of the pool.

Rifle in hand, I waited for some time for its reappearance; but it did not again come to the surface. Likely enough, it had been shot at before, or otherwise attacked; and now recognised in the upright form a dangerous enemy. The proximity of the pond to a frequented road rendered probable the supposition.

Neither my companion nor I would have thought more about it, but for the similarity of the scene to one well known to us. In truth, the resemblance was remarkable—the pond, the rocks, the trees that grew around, all bore a likeness to those with which our eyes were familiar. Even the reptile we had just seen—in form, in size, in fierce ugly aspect—appeared the

exact counterpart to that one whose story was now a legend of the plantation.

The wild scenes of that day were recalled; the details starting fresh into our recollection, as if they had been things of yesterday—the luring of the amphibious monster—the perilous encounter in the tank—the chase—the capture—the trial and fiery sentence—the escape—the long lingering pursuit across the lake, and the abrupt awful ending—all were remembered at the moment with vivid distinctness. I could almost fancy I heard that cry of agony—that half-drowned ejaculation, uttered by the victim as he sank below the surface of the water. They were not pleasant memories either to my companion or myself, and we soon ceased to discourse of them.

As if to bring more agreeable reflections, the cheerful 'gobble' of a wild turkey at that moment sounded in our ears; and Jake asked my permission to go in search of the game. No objection being made, he took up the rifle, and left me.

I re-lit my 'havana'—stretched myself as before along the soft sward, watched the circling eddies of the purple smoke, inhaled the narcotic fragrance of the flowers, and once more fell asleep.

This time I dreamed, and my dreams appeared to be only the continuation of the thoughts that had been so recently in my mind. They were visions of that eventful day; and once more its events passed in review before me, just as they had occurred.

In one thing, however, my dream differed from the reality. I dreamt that I saw the mulatto rising back to the surface of the water, and climbing out upon the shore of the island. I dreamt that he had escaped unscathed, unhurt—that he had returned to revenge himself—that by some means he had got me in his power, and was about to kill me!

At this crisis in my dream, I was again suddenly awakened—this time not by the splashing of water, but by the sharp 'spang' of a rifle that had been fired near.

'Jake has found the turkeys,' thought I. 'I hope he has taken good aim. I should like to carry one to the fort. It might be welcome at the mess-table, since I hear that the larder is not overstocked. Jake is a good shot, and not likely to miss. If'—

My reflections were suddenly interrupted by a second report, which, from its sharp detonation, I knew to be also that of a rifle.

'My God! what can it mean? Jake has but one gun, and but one barrel—he cannot have reloaded since; he has not had time. Was the first only a fancy of my dream? Surely I heard a report? surely it was that which awoke me? There were two shots—I could not be mistaken.'

In surprise, I sprang to my feet. I was alarmed as well. I was alarmed for the safety of my companion. Certainly I had heard two reports. Two rifles must have been fired, and by two men. Jake may have been one, but who was the other? We were upon dangerous ground. Was it an enemy?

I shouted out, calling the black by name.

I was relieved on hearing his voice. I heard it at some distance off in the woods; but I drew fresh alarm from it as I listened. It was uttered, not in reply to my call, but in accents of terror.

Mystified, as well as alarmed, I seized my pistols, and ran forward to meet him. I could tell that he was coming towards me, and was near; but under the dark shadow of the trees his black body was not yet visible. He still continued to cry out, and I could now distinguish what he was saying.

'Gorramighty! Gorramighty!' he exclaimed in a tone of extreme terror. 'Lor! Masser George, are you hurt?'

'Hurt! what the deuce should hurt me?'

But for the two reports, I should have fancied that

he had fired the rifle, in my direction, and was under the impression he might have hit me.

'You are not shot? Gorramighty be thank you are not shot, Masser George.'

'Why, Jake, what does it all mean?'

At this moment, he emerged from the heavy timber, and in the open ground I had a clear view of him.

His aspect did not relieve me from the apprehension that something strange had occurred.

He was the very picture of terror, as exhibited in a negro. His eyes were rolling in their sockets—the whites oftener visible than either pupil or iris. His lips were white and bloodless; the black skin upon his face was blanched to an ashy paleness; and his teeth chattered as he spoke. His attitudes and gestures confirmed my belief that he was in a state of extreme terror.

As soon as he saw me, he ran hurriedly up, and grasped me by the arm—at the same time casting fearful glances in the direction whence he had come, as if some dread danger was behind him!

I knew that under ordinary circumstances Jake was no coward—quite the contrary. There must have been peril then—what was it?

I looked back; but in the dark depths of the forest shade, I could distinguish no other object than the brown trunks of the trees.

I again appealed to him for an explanation.

'O Lor! it wa—wa—war him; Ise sure it war him.'

'Him? who?'

'O Masser George; you—you—you shure you not hurt. He fire at you. I see him t—t—take aim; I fire at him—I fire after; I mi—mi—miss; he run away—way—way.'

'Who fired? who ran away?'

'O Gor! it wa—wa—war him; him or him go—go—ghost.'

'For heaven's sake, explain! what him? what ghost? Was it the devil you have seen?'

'Troof, Masser George; dat am de troof. It wa—wa—war de debbel I see: it war Yell' Jake.'

'Yellow Jake?'

CURIOSITIES OF STEAM-POWER.

So great are our obligations to this prime mover, and so important is its place in modern civilisation, that any information relating to it is interesting. Those who have studied the subject will receive with some little surprise the new facts to which we now propose to direct their attention, and which may be said to be of somewhat an anomalous character.

The first of these facts is, that, in the process of condensation, another circumstance than the mere presence of cold water is necessary, at least as regards condensation in tubes; and the second is, that the steam itself may be made to produce a vacuum, the use of which in working engines promises to be of very great importance. We shall endeavour to place both these matters briefly before our readers.

It is popularly known that, in the 'low-pressure' engines, such as are used in most sea-going ships, the 'used steam'—that is, the steam which has just driven the piston from one end of the cylinder to the other—is allowed to escape into a secondary vessel, called the 'condenser,' where it is met by a dash of cold salt water, which condenses it. It is evident, however, that the water formed by this condensation must be saline and impure, and is consequently unfit to return to the boiler with good effect. But a very great improvement on this system is in contemplation, which consists in the condensation being carried on in a tube passing through cold salt water, not in the cold salt water itself.

Here a most curious fact presents itself. Upon the

assurance of scientific men, we believe if steam be passed through a *dry* tube, passing through cold water, most of it will issue at the other end of the tube unchanged. If, on the other hand, a certain quantity of hot water, formed from former steam, remains in the tube, bent for the purpose of retaining it in the hollow, then all the steam will be condensed, and flow out in the state of water.

Thus the recovery of any quantity of used steam may be provided for without any necessity for admixture with salt water. It is only necessary to pass this used steam into a tube running a certain way through a body of cold water, and having a bend near the point of final escape containing a little hot water, and all the steam will reappear as hot water. The importance of this to marine steam-navigation is obviously incalculable: its advantages, in point of facility and simplicity, over other modes of accomplishing the same object, must be plain at the first glance to all who are in the least acquainted with the subject.

But it has to be considered that one advantage of the old mode of condensation is, that the used steam escapes into a vacuum, and consequently with much greater facility than it would even into a space filled with air, not to mention one filled with elastic steam.

The mode of producing this vacuum by the agency of the steam itself, and which we shall now attempt to describe, strikes us as being extremely interesting. Let us suppose a boiler generating and sending forth steam through a conducting tube into a cylinder. This steam will drive the piston along, until, finding a valve open, its own elasticity causes it to rush into the space left free to it beyond the valve. Here, in the old system, it was met, as before observed, by the cold-water 'dash,' and, as steam, destroyed; now, it will be allowed to escape into the bent tube above described, and will be propelled along this tube at the presumed rate of pressure—about thirty pounds to the inch. The effect of the cold water outside, and the hot water in the bend of the tube, will cause it to condense as we have said; but the vacuum into which the water may run has still to be provided.

To effect this object, the bent tube is connected with a closed vessel fitted with a valve at top opening outwards, and thus the first operation will be the filling the whole apparatus with steam at a certain pressure; but when the water condenses in the tube, for the reasons mentioned above, the supply of steam is cut off, the valve of the closed vessel will shut, and prevent the entrance of air, and thus a vacuum will be formed by the simplest and most natural means, and the flow of the condensed steam, in the form of water, into the vessel, will go on *in vacuo*. Thus, the same advantages will be secured in the new as under the old system, so far as the vacuum is concerned; but, in addition, the water thus recovered will be returned to the boiler, not only free from all impurity—as distilled fresh water, in fact—but also at a heat which will promote economy in fuel to a considerable extent.

It would be quite superfluous to insist upon advantages so obvious as these; and we have no doubt that the ascertained laws relating to them will allow of their being fully realised in the way proposed. The great desideratum, in the absence of any less complicated prime mover, is obviously some certain mode of preventing the waste of water—that is, of fresh water—in long sea-voyages. 'Hall's Condensers' had done much to meet the case; but a moment's reflection will enable the reader to see that, in the way now proposed, the object will be accomplished on the most advantageous and economical principle; and although the assertion may seem somewhat rash, in presence of ever-progressing improvements, it seems as if we had reached the point where nothing more can be desired, in this way the limit of perfection having been attained.

LOST IN THE MIST.

THE thin white snow-streaks pencilling
The mountain's shoulder gray,
While, in the west the pale-green sky
Smiled back the dawning day,
Till from the misty east, the sun
Was of a sudden born
Like a new soul in paradise—
How long it seems since morn !

One little hour, O round red sun,
And thou and I shall come
Unto the golden gate of rest,
The open door of home;
One little hour, O weary sun,
Delay the murky eve,
Till these tired feet that pleasant door
Enter, and never leave.

Ye rooks that wing in slender file
Into the thickening gloom,
Ye 'll scarce have reached your old gray tower
Ere I have reached my home :
Plover, that thrill'st this lonely moor
With such an eerie cry,
Seek you your nest ere night falls down,
As my heart's nest seek I.

O light, light heart, O heavy feet,
Beat time a little while;
Keep the warm love-light in these eyes,
And on these lips the smile.
Outspeed the mist, the gathering mist
That follows o'er the moor;
The darker grows the world without,
The brighter shines that door.

O door, so close, yet so far off;
Grim mist that nears and nears;
Coward ! to faint in sight of mine,
Blinded—but not with tears;
'Tis but the mist, the cruel mist,
That chills this heart of mine,
My eyes that cannot see the light,
Not that it ceased to shine.

A little further—further yet;
How the mist crawls and crawls !
It hems me round, it shuts me in
Its white sepulchral walls :
No earth, no sky, no path, no light;
Silence as of a tomb :
Dear heaven, it is too soon to die—
And I was going home !

A little further—further yet :
My limbs are young ; my heart—
O heart, it is not only life
That is so hard to part :
Poor lips, slow freezing into calm,
Numbed hands, that nerveless fall ;
And a mile off, warm lips, safe hands,
Waiting to welcome all !

I see the pictures in the room,
The light forms moving round,
The very flicker of the fire
Upon the patterned ground ;
O that I were the shepherd dog
That guards their happy door !
Or even the silly household cat
That basks upon the floor.

O that I lay one minute's space
Where I have lain so long :
O that I heard one little word
Sweeter than angel's song !
A pause—and then the table fills,
The mirth brims o'er and o'er ;
While I—oh, can it be God's will ?
I die, outside the door.

My body fails, my quickened soul
Fights, desperate, ere it go ;
'The blank air shrieks with voices wild,
But not the voice I know :
Dim shapes come beckoning through the dark ;
Ghost-touches thrill my hair ;
Faces, long strange, peer glimmering by,
But one face is not there.

Lost—lost ! and such a little way
From that dear sheltering door :
Lost, lost, out of the open arms
Left empty evermore :
His will be done. O gate of heaven,
Fairer than earthly door,
Receive me !—Everlasting Arms
Enfold me evermore !

And so, farewell. * * *

No mortal hand
This, on my darkening eyes ?
My name too—which I thought to hear
Next time in Paradise ?
Warm arms—close lips—oh, saved, saved, saved !
Across the deathly moor
Sought, found ! and yonder through the night
Shineth the blessed door.

THE WEATHER OF 1857.

We are informed by the *Meteorological Report* from Wellington Road, Birmingham, that last year was remarkable throughout, with the exception of the month of April, for its high mean temperature. The excess was greatest in summer and autumn ; while in December the temperature was seven degrees above the average. The reporter attempts to account for the warmth being retained during the later months of the year by the comparative paucity of clear nights : 'It appears to me to be pretty clear that the moist state of the atmosphere, accompanied by a high barometric pressure, has had an influence in retaining a portion of this high temperature during the latter part of the year. Whenever the surface has been cooled down by night radiation under a clear evening sky, fog, and subsequently cloud, has almost invariably been the result, and thus the earth has been shielded from the cooling process. Indeed, I cannot call to mind many nights during the fall of the year which have been clear from sunset to sunrise.' While such was the state of the temperature, the quantity of rain that fell during the year was about an average ; it was more evenly distributed throughout the months than usual ; but September shewed the largest collection, and December the smallest.

'MANY THOUGHTS ON MANY THINGS.'

The book recently published with this title is a marvellously substantial quarto of 'selections from the writings of the known great and the great unknown,' by Henry Southgate (Routledge). It serves the purpose of a dictionary of quotations ; and being analytically arranged, is a readable book besides ; giving the opinions and fancies, in prose and verse, of numerous authors, ancient and modern, on each subject referred to. The motto on the title-page, from Coleridge, may be cited as a specimen of the work itself, as well as an apology for its publication : 'Why are not more gems from our great authors scattered over the country? Great books are not in everybody's reach ; and though it is better to know them thoroughly than to know them only here and there, yet it is a good work to give a little to those who have neither time nor means to get more. Let every bookworm, when in any fragrant, scarce old tome he discovers a sentence, a story, an illustration, that does his heart good, hasten to give it.'

Printed and Published by W. & R. CHAMBERS, 47 PATERNOSTER ROW, LONDON, and 359 High Street, EDINBURGH. Also sold by WILLIAM ROBERTSON, 23 Upper Sackville Street, DUBLIN, and all Booksellers.

PRICE 1½d.

LOST.

LOOKING over the *Times*' advertisements, one's eye often catches such as the following:—'Lost, a Youth' (while ships and schools exist, not so very mysterious); 'Missing, an Elderly Gentleman' (who has apparently walked quietly off to his City-office one morning, and never been heard of more).—Or merely, 'Left his Home, John So-and-So,' who, after more or less entreaties to return thereto, may have the pleasure of seeing, by succeeding advertisements of 'Reward Offered,' whether he is valued by his disconsolate kindred at ten, fifteen, or fifty pounds. Other 'bits' there are, at which we feel it cruel to smile: one, for instance, which appeared for months on the first day of the month, saying: 'If you are not at home by' such a date, 'I shall have left England in search of you;' and proceeding to explain that he or she had left orders for that periodical advertisement; giving also addresses of banker, &c., in case of the other's coming home meantime; all with a curious business-like, and yet pathetic providence against all chances, which rarely springs from any source save one.

All newspaper readers must have noticed in mysterious accidents or murders, what numbers of people are sure to come forward in hopes of identifying the unknown 'body.' In a late case, when a young woman was found brutally shot in a wood, it was remarkable how many came from all parts of the country to view the corpse—persons who had missing relatives bearing the same initials as those on the victim's linen—parents with a daughter gone to service, and then entirely lost sight of—friends with a friend gone to meet her husband, and embark for Australia, but who had never embarked or been heard of again; and so on; all seeking some clue to a mournful mystery, which may remain such to this day, for the dead woman turned out to belong to none of them.

But these things suggest the grave reflection—what a number of people there must be in the world who are, not figuratively or poetically, but literally, 'lost;' who by some means or other, accident, intention, carelessness, misfortune, or crime, have slipped out of the home circle, or the wider round of friendship or acquaintanceship, and never reappeared more; whose place has gradually been filled up; whose very memory is almost forgotten, and against whose name and date of birth in the family Bible—if they ever had a family and a Bible—stands neither the brief momentous annotation 'Married,' &c., nor the still briefer, and often much safer and happier inscription, 'Died'—nothing

save the ominous, pathetic blank, which only the unveiled secrets of the Last Day will ever fill up.

In the present times, when everybody is running to and fro—when, instead of the rule, it is quite the exception to meet with any man who has not navigated at least half of the globe—when almost every large family has one or more of its members scattered in one or two quarters of the civilised or uncivilised world—cases such as these must occur often. Indeed, nearly every person's knowledge or experience could furnish some. What a list it would make!—worse, if possible, than the terrible 'List of Killed and Wounded' which dims and blinds many an uninterested eye; or the 'List of Passengers and Crew,' after an ocean-shipwreck, where common sense forebodes that 'missing' must necessarily imply death—how, God knows!—yet sure and speedy death. But in this unwritten list of 'lost,' death is a certainty never to be attained—not even when such certainty would be almost as blessed as life, or happy return—or more so.

For in these cases, the 'lost' are not alone to be considered. By that strange dispensation of Providence which often makes the most reckless the most lovable, and the most froward the most beloved, it rarely happens that the most Cain-like vagabond that wanders over the face of the earth, has not some human being who cares for him—in greater or less degree, yet still cares for him. Nor, abjuring this view of the subject, can we take the strictly practical side of it, without perceiving that it is next to impossible for any human being so completely to isolate himself from his species, that his life or death shall not affect any other human being in any possible way.

Doubtless, many persuade themselves of this fact, through bravado or misanthropy, or the thoughtless selfishness which a wandering life almost invariably induces. They maintain the doctrine which—when a man has been tossed up and down the world, in India, America, Australia, in all sorts of circumstances and among all sorts of people—he is naturally prone to believe the one great truth of life: 'Every man for himself, and God for us all.' But it is not a truth; it is a lie. Where every man lives only for himself, it is—not God—but the devil—for us all.

It is worth while, in thinking of those who are thus voluntarily 'lost,' to suggest this fact to the great tide of our emigrating youth, who go—and God speed them if they go honestly—to make in a new country the bread they cannot find here. In all the changes of work and scene, many are prone gradually to forget—some to believe themselves forgotten—home fades away in distance—letters get fewer and fewer. The wanderer begins to feel himself a waif and stray. Like

Dickens's poor Jo, he has got into a habit of being 'chivied and chivied,' and kept 'moving on;' till he has learned to feel no particular tie or interest in anybody or anything, and therefore concludes nobody can have any tie or interest in him. So he just writes home by rare accident, when he happens to remember it—or never writes at all—vanishes slowly from everybody's reach, or drops suddenly out of the world; nobody knows how, or when, or where; nor ever can know, till the earth and sea give up their dead—

But long they looked, and feared, and wept,
Within his distant home,
And dreamed, and started as they slept,
For joy that he was come.

Alas, how many a household, how many a heart, has borne that utterly irremediable and interminable anguish, worse far than the anguish over a grave, which Wordsworth has faintly indicated in *The Affliction of Margaret*:

Where art thou, my beloved son?
Where art thou, worse to me than dead?
Oh, find me—prosperous or undone!
Or if the grave be now thy bed,
Why am I ignorant of the same,
That I may rest, and neither blame
Nor sorrow may attend thy name?

I look for ghosts, but none will force
Their way to me. 'Tis falsely said
That there was ever intercourse
Betwixt the living and the dead,
For surely then I should have sight
Of him I wait for day and night,
With love and longings infinite.

It may seem a painfully small and practical lesson to draw from an agony so unspeakable; but surely it cannot be too strongly impressed upon our wandering youth, who go to earn their living across the seas—in the Australian bush, or the Canadian forests, or the greater wildernesses of foreign cities, east and west: that they ought everywhere and under all available circumstances, to endeavour to leave a clue whereby their friends may hear of them, living or dead. That if, always, it is the duty of a solitary man or woman, while living, so to arrange affairs that his or her death shall cause least pain or trouble to any one else; surely this is tenfold the duty of those who go abroad: that whatever happens, they may be to those that love them, only the dead, never the 'lost.'

Sometimes under this category come persons of a totally different fate—and yet the same—whose true history is rarely found out till it is ended, and perhaps not then. People who have sprung up, nobody knows how, who have nobody belonging to them—neither ancestors nor descendants—though as soon as they are gone, hundreds are wildly eager to make themselves out to be either or both. Of such is a case now pending, well known in the west of Scotland, where the 'next of kin' to an almost fabulous amount of property is advertised for by government, once in seven years; and where scores of Scotch cousins, indefinitely removed, periodically turn up, and spend hundreds of pounds in proving, or failing to prove—for all have failed hitherto—their relationship to the 'dear deceased.' This was an old gentleman in India, who neither there nor in his native Scotland had a single soul belonging to him, or caring to 'call cousins' with

him; who, indeed, had never been heard of till he died, worth a million or so, leaving all the wealth he had laboured to amass—to-Nobody. Truly the poor solitary nabob may be put among the melancholy record of those 'lost,' whose names have been long erased, or were never writ, on the only tablet worth anything in this world—the register of friendship, kindred, home.

Similar instances of fortunes, greater or less, 'going a-begging' for want of heirs, are common enough—commoner than people have the least idea of. Government annually pockets—very honestly, and after long search and patient waiting—a considerable sum, composed of unclaimed bank dividends, and real and personal property of all kinds, the heir or heirs to which it is impossible to find. Among these, the amount of dead sailors' pay is said to be a remarkable item—thousands of pounds, being wages due, thus yearly lapsing to government, because all the ingenuity of the harbour-master, into whose hands the money is required to be paid, cannot find any relative of poor departed 'Bill' or 'Jack'—whose place of birth has likely been never heard of—who has gone under so many aliases that even his right surname is scarcely discoverable, and often has lived, died, and been buried as simple 'Jack' or 'Bill,' without any surname at all.

This indifference to an hereditary patronymic is a curious characteristic of all wanderers of the lower class. Soldiers, sailors, and navvies engaged abroad, will often be found to have gone by half-a-dozen different surnames, or to have let the original name be varied *ad libitum*, as from Donald to M'Donald, and back again to Donaldson, possibly ending as O'Donnell, or plain Don. Frequently, in engaging themselves, they will give any new name that comes uppermost—Smith, Brown, Jones: or will change names with a 'mate'—after the German fashion of ratifying the closest bond of friendship—thereby producing inextricable confusion, should they chance to die, leaving anything to be inherited.

Otherwise—of course it matters not. They just drop out of life, nameless and unnoticed, of no more account than a pebble dropped into the deep sea; and yet every one of them must have had a father and a mother, may have had brothers and sisters, might have had wives and children, and all the close links of home. Much as we pity those who lose all these—the bonds, duties, and cares which, however heavy sometimes, are a man's greatest safeguard and strength, without which he is but a rootless tree, a dead log drifted about on the waters—still more may we pity those, in all ranks and positions of life, who are thus 'lost.' Not in any discreditable sense, perhaps from no individual fault; but that fatal 'conjuncture of circumstances,' far easier to blame than to overcome—possibly from being 'too easy,' 'too good,' 'nobody's enemy but their own.' Still, by some means or other—God help them—they have let themselves drop out of the chain of consecutive existence, like a bead dropped off a string, and are 'lost.'

Equally so, are some, of whom few of us are so happy as never to have counted any—whom the American poet Bryant, already quoted, touchingly characterises as 'the living lost.' Not the fallen, the guilty, or even the prodigal, so hopelessly degraded that only at the gates of the grave and from one Father can he look for that restoration, to grant which, 'while he was yet afar off, his Father saw him.'

Not these, but others who bear no outward sign of their condition; whom the world calls fortunate, happy, righteous—and so they may be towards many, yet to a few, familiar with their deepest hearts, knowing all they were and might have been, still be irrevocably, hopelessly, 'the living lost.' Lost as utterly as if the grave had swallowed them up, mourned as bitterly as one mourneth for those that depart to return no more.

Everybody owns some of these; kindred, whom prosperity has taught that 'bluid' is not 'thicker than water;' friends who have long ceased to share anything of friendship but the name—perhaps even not that; lovers who meet accidentally as strangers; brothers and sisters who pass one another in the street with averted faces—the same faces which 'cuddled' cosily up to the same mother's breast. These things are sad—sad and strange; so strange, that we hardly believe them in youth, at least not as possible to happen to us; and yet they do happen, and we are obliged to bear them. Obligated to endure losses worse than death, and never seem as if we had lost anything—smilingly to take the credit of possessions that we know are ours no longer—or quietly to close accounts, pay an honourable dividend, cheat nobody, and sit down, honest beggars—but 'tis over! Most of us—as at the end of the year we are prone, morally as well as arithmetically, to calculate our havings and spendings, and strike the balance of our property—are also prone—and it may be good for us too—to linger a little over the one brief item, 'Lost.'

But in all good lives, even as in all well-balanced, prudent ledgers, this item is far less heavy, in the sum-total, than at first appears. Ay, though therein we have to count year by year, deaths many, partings many, infidelities and estrangements not a few. Though, if by good-fortune or good providence, we be not ourselves among the list of the lost, we have no guarantee against being numbered among that of the losers.

The most united family may have to count among its members one 'black sheep,' pitied or blamed, by a few lingeringly, hopelessly, sorrowfully loved; coming back at intervals, generally to everybody's consternation and pain: at last never coming back any more. The faithfulest of friends may come one day to clasp his friend's hand, look in his friend's face—and find there something altogether new and strange, which he shrinks from as from some unholy spirit which has entered and possessed itself of the familiar form. The fondest and best of mothers may live to miss, silently and tearlessly, from her Christmas-table, some one child whom she knows, and knows that all her other children know, is more welcome in absence than in presence, whom to have laid sinless in a baby's coffin, and buried years ago, would have been as nothing—nothing.

Yet all these things must be, and we must pass through them, that in the mysterious working of evil with good, our souls may come out purified as with fire. The comfort is that in the total account of gains and losses, every honest and tender soul will find out, soon or late, that the irremediable catalogue of the latter is, we repeat, far lighter than at first seems.

For, who are the 'lost?' Not the dead, who 'rest from their labours,' and with whom to die is often to be eternally beloved and remembered. Not the far-away, who, especially at the grand festival-time, are as close to every faithful heart as if their faces laughed at the Christmas-board, and their warm grasp wished all 'a happy new-year.' Never, under all circumstances that unkind fate can mesh together, under all partings that death can make, need those fear to be either lost or losers who, in the words of our English prayer-book, can pray together that 'amidst all the chances and changes of this mortal life, our hearts may surely

there be fixed where true joys are to be found.' Where, whatever may be the 'tongue of men or of angels,' that we shall have learned to speak with, then, we may be quite sure that there shall be in it no such word as 'lost.'

WATCHING THE CLOCK.

I AM myself Yorkshire all over, but my late lamented father had the misfortune to be one-half Oxon, and it is to that circumstance, doubtless, that the public is indebted for the following interesting relation: no Yorkshireman would have given an opportunity for the thing to have occurred. I preface the incident thus abruptly, from a desire to extenuate in some measure at the outset my dear parent's viridity and trustfulness in the matter; I feel so entirely ashamed of the dear departed, when I remember how he was taken in, that I have no patience to tell the story as it should be told. I remember reading in a certain book a tale of a woman in Arabia, or some other very distant unknown country, following her dead son's body to the grave, and ejaculating to the poor lad's glory and honour: 'He never, never, never told a lie;' and so in our county we are accustomed to congratulate ourselves upon our relatives, deceased or otherwise, never having been duped or 'done' by their fellow-creatures. Every people, I suppose, has some particular virtue which it exaggerates, and sets especial store by; in Arabia, as it seems, it is truth, while with us in Yorkshire it is not so much that as 'cuteness.' 'We mayn't be clever, but partial friends do say we are "downy,"' is the modest motto of many hundreds of my countrymen; but it can never be that of our house, alas! after the misfortune which occurred to the late head of it, over whose remains, whatever filial remark I might have uttered, it would have been mere blind flattery to have said: 'He never, never, never was taken in.' He was most utterly taken in and despoiled of both money and reputation, and that—ah me that his son should have to write it—even by Londoners.

We reside in a country village not many miles from York itself; which being surrounded with suitable lands, and possessing many equine advantages, the whole business of the place has long been that of breeding and training race-horses. Every decent house in it except our own is a trainer's, every barn and cart-house has been metamorphosed into stables and loose boxes. From the mossy mounting-stone at one end of Little Studdington, to the water-trough with its running stream at the other, we are altogether of the horse, horsey. A village of Yahoos where man is of no consequence as compared with the quadruped; where the horse is kept cleaner and warmer, is better housed and better fed, is more pampered when he is well and more cared for when he is ill, than are any of those whom we call (sarcastically) our poorer brethren; and all this occurs not so much, I fear, through misdirected benevolence, as because there is a great deal more money to be got by the equine than the human. Of course the Studdingtonians are as sharp as sharp can be. Racing-stables are, as it were, forcing-houses for the particular sort of mental activity to which I have already alluded, so that our very infants—certainly our five-year-olds—are precociously and preternaturally 'Yorkshire.' For low cunning and sleepless suspicion, I would back our jockey-boys against all the Bevis Marks attorneys in the kingdom. In the way of turf-business, they would do their own fathers—if they happened to have a personal knowledge of that relative, which is not, however, generally the case—as soon as look at them; nor have I observed many symptoms of that honour about them, which is said to exist among a certain less legalised but scarcely more reputable fraternity. They have no trainers, poor

lads; and as for their owners, these have but few morals to make a present of, I fear, or even to keep for themselves. I have heard that there is a large class of American persons upon the other side of the Atlantic who pride themselves upon being 'smart' and 'spritly,' and tolerably exempt from the trammels of conscientious principle. I wish sincerely—if they have any dollars—that these gentry would come across to Little Studdington, and try their luck with us: as my poor father used to observe, when any strangers paid us a visit, they would have to put both hands to keep their hats on their heads, I reckon, and then we should pick their pockets. The governor himself was quite unfit to live in such a place as this, and still more to keep an inn in it; and that he knew. But he had come to Little Studdington when it was inhabited not by horses, but by human beings, and these Yorkshire, indeed, but far from being turfites. A trout stream skirted our lawn before 'The Angler's Rest,' and his customers here were for the most part fishermen: easy-going, kind-hearted gentry, who were pleased with their clean and comfortable lodging, and valued their host very highly; hospitable folks, who would often ask him to dine with them in the little low-roofed parlour upon the captives to their rod and landing-net, and to crack a bottle with them out of his own cellar; respectable people, who, if they stayed over the Sunday, would go to the old gray church quite naturally, as though they did it every week at home, and very different from Mr Clifney Bity, the only trainer amongst us who has any religion at all, and who goes once a year upon the Sunday before the St Leger, in hopes—the sinner!—to get a pull upon his rivals by that superstitious device. My poor father never made but one bet in his life, and that one was the cause of his misfortune.

About ten years ago, the grand national and provincial steeple-chases took place at York, and attracted vast quantities of fine folks: there were a great number of entries for the principal stake; and several of the worst horses were, contrary to custom, permitted to run for it, instead of being 'scratched' by their owners the night before the race. York could not literally hold all its sporting visitors; and three very gentleman-like and well-dressed strangers came even so far as Little Studdington, and put up at 'The Angler's Rest.' They went into town, and returned from it every day in our four-wheel during the week; and when the races were over, they were so enamoured of the snug little house and its capital accommodation, that they remained with us a fortnight, eating and drinking of the best, and always delighted to see the old gentleman at their dinner-table. I think I can see my respected parent now, as he was wont to sit upon the extreme edge of his well-polished chair, in rapt astonishment at their fashionable conversation. If they happened to mention an absent friend under the rank of a baronet, it was in a sort of apologetic tone—their connections being so exclusively aristocratic. Good society was my poor father's weakness; and never having been familiar with the turf himself, his sense of the excellences of our nobility was quite overwhelming. The three friends were wont to play at cards after dinner for pretty large sums; and the game which seemed best to suit their elegant but eccentric taste was that of triangular cribbage. My father was a capital hand at this, and easily perceived that they were but indifferent performers; but they never dreamed of asking him to cut in, although one or other of them would often request his advice at an important crisis.

Cautious, indeed, as the governor naturally was, it must be confessed that his fingers itched to hold a hand against these folks who, as often as not, neglected to peg 'one for his heels,' or 'two for his nob,' but

his respect for their exalted condition always deterred him from expressing his wishes. Often and often did my poor father lament, after his misfortune, that he never had had a chance with the cards; but my belief is, that had he ventured upon such a thing, these unskilful gentry would have very rapidly improved in their play, and would have won his shirt off his back if they had played long enough.

One afternoon, when they had dined as usual, early, and before the cards were produced, their conversation turned upon wagers: how Lord Clickclack had won ten thousand pounds by being dumb for a day; how the Duke of Oxfordshire had backed himself to walk from Pall-mall to Bond Street on a levee morning, without opening his eyes; and of the ingenious device of his antagonist, the Marquis of Luxall, in driving over him in a Hansom cab until he did so; with many other anecdotes of the aristocracy not included in the collection of Mr Burke.

'This sort of thing is much harder than it appears to be,' observed one of the three gentlemen. 'Now, I will lay ten pounds that no man keeps himself in one position and counts the ticks of that great clock, for instance, for a whole hour.'

'How do you mean?' exclaimed my father, greatly interested.

'Why, that no man can sit in a chair—your chair, for instance—facing the clock, and wag his head from right to left as Old Time with the scythe yonder is wagging, for the space of an hour, and never say any words but "Here she comes, and there she goes," as the clock says.'

'You bet ten pounds that I don't do *that*!' cried the governor.

'Not with you,' replied the other coolly; 'I don't want to win *your* money, my good man. I will bet either of my two friends that *they* do not do it.'

'Nay,' said one of them, 'tis easy enough; but I would not bother myself with such a thing for twice the money. I don't see,' added he, 'why you should not give our good Boniface a chance, either.'

'Do, pray, do,' cried my father, who was perhaps the most stolid man in the world, and could have sat six hours doing anything he was told to do without any inconvenience. 'I'll bet you.'

So, rather against his will, as it seemed, he who had proposed the conditions agreed to make the wager.

My father was then placed in his chair immediately opposite the clock; the stakes on either side were placed upon the table within his view; he was warned that every means would be resorted to short of laying hands upon him to induce him to look away, or say anything besides the words agreed upon; and as the clock struck four, the old gentleman's head had begun to wag, 'Here she comes, and there she goes,' and 'Here she comes, and there she goes,' very slowly and solemnly, keeping time with the pendulum.

'He'll lose,' cried one of the gentlemen.

'Certain to lose,' replied another laughing. 'Hallo, old chap, there goes your window-pane!'

There was a crash of breaking glass, that made the governor wince again, but he did not alter his position a hairbreadth, or desert one quarter of a tick from his monotonous task. Some of the particular china which then ornamented our oaken shelves next came down with a run; but its owner's face only turned a little pale, as he thought what stepmother would say about it. 'Here she comes, and there she goes,' was all it drew from him.

His antagonist seemed now to have given up the destructive plan as a failure.

'I say, Boniface,' cried he, 'I am going to put the stakes in my pocket—I am;' and suiting the action to the word, he swept off the two ten-pound notes into his waistcoat before the governor's eyes.

A shadow of anxiety flitted for an instant across my

parent's brow, but 'Here she comes, and there she goes,' was all that torture itself would at that time have wrung from him. Ten minutes of the terrible ordeal had already passed.

'Boniface,' observed the sporting gentleman with feeling, 'we must now part. My friends and myself have passed a pleasant time at Little Studdington, but our visit is now at an end. One of us has just gone out to order the four-wheel; and by rapid driving, we shall just catch the express train to London. In anticipation of this position of affairs, our little articles are already packed and ready to be placed under the seat. Receive, my dear sir, the assurances of our consideration. I wish that we had anything else to offer you in return for your very genial hospitality; this ten-pound note of yours will remind us, be assured, of your kindness, until the day when it shall be spent. I would that the terms of our little wager permitted us to shake you by the hand. Unlucky it is, too, that we start from the back-door, so that you will be unable, of course, to see the very last of us. In forty minutes about, you will be released from this irksome task, and we ourselves shall be at York, Boniface. Heaven bless you: What! not a word at parting?'

'Here she comes, and there she goes,' cried the governor stoutly, but suffused with a cold perspiration.

'Yes, here she comes,' repeated the sporting gentleman derisively, as the sound of wheels made itself to be distinctly heard from the back; 'and there she will go in about a minute: she is a fast mare.'

He closed the door, and the governor was left alone with the broken window, and the smashed china, and the infernal pendulum, repeating his prescribed formula with the utmost constancy, but with an anxious expression of countenance.

To him presently entered my maternal step-parent, who is of a suspicious temperament. 'Whatever have you been about, John, to let them chaps go away without any one to drive Polly, and at such a pace as— Goodness gracious, the china! What has happened? Rachel, Betty, Dick,' screamed she, 'what has come to your poor father? Do but look at him! Speak to us, John.'

'Here she comes, and there she goes,' murmured the governor sadly, and awaying himself slowly from side to side like a mandarin.

I shall never forget the scene as long as I live: I laughed until I could stand up no longer, and then I lay down on the floor and laughed there. The indignation that was thrown into the old gentleman's tones as he pursued his terrible task, only made the matter ten times more ridiculous.

'He is mad, stark staring mad,' cried my step-mother, as she laid her hand upon his shoulder.

'Here she comes, and there she goes,' exclaimed my father irascibly, as with one well-directed blow of his elbow he tumbled the old lady upon the floor.

Then I really thought he had gone mad, and went to get a rope to tie his arms; only the foam flew from his lips—he was in that passion of rage—that I did not dare come near him when I had got it. We sent for the policeman therefore, and of course we sent for the doctor; and presently they both arrived, and were as astonished as we were to see what was taking place.

'When did this fit come on him?' asked the medical man, as the old clock struck five.

'Here she comes, and there she goes,' yelled the governor, starting up from his chair. 'Where are those three thieves? They have robbed me of ten pounds, and board, and horse-hire, and lodging for fifteen days and a half.' (He had been calculating all this, poor fellow, in case they should have really gone away, while he was repeating his foolish sentences.) 'Ride after them—ride!'

Alas! we did ride, but we never came up with

them. They had left our Polly at the station in the four-wheel, but they were off nobody knows where. We found out only, long afterwards, that our visitors were three of the London swell-mob, who had been warned out of York by the detectives during the race week, to which circumstance we had been of course indebted for their patronage. My poor father never held up his head again: the jockey-boys were always wagging theirs whenever they saw him, and crying out: 'Here she comes, and there she goes,' until he was driven into his grave.

It is a sad story from beginning to end; but now, that I have fairly published it, I feel that there is something off my mind. There will be no need for futile attempts upon my part to conceal this disgrace to my family any more. And perhaps, after all, one of the reasons why I am so 'up to the time of day' myself—as we say in Yorkshire—is because of the warning that was afforded to me in my poor father's watching the clock.

AN UNRAVELLED MYSTERY.

INTIMATELY connected with the first impressions derived from Scriptural readings and lessons, the words Babylon, Nineveh, and Assyria have been familiar to us all from early childhood. Yet, when we seriously inquire what it is we really do know respecting the history, or even geographical boundaries of ancient Assyria, we are reluctantly compelled to acknowledge our total ignorance. Profane history, it is true, records the names of three of its monarchs previous to the invasion of the Medes. We read of the Bactrian and Indian expeditions of Ninus, the wondrous works of the masculine Semiramis, the Sybaritic splendours of the effeminate Sardanapalus; but the best judges are undecided whether we should accept these relations as history, or class them among the numberless other fables of the myth-inventing ages.

A new light, however, has lately been thrown upon this most interesting period in the world's history. Modern enterprise had scarcely discovered, ere modern ingenuity began to decipher, with what amount of success we are about to relate, the long-hidden monuments of Assyria. When Mr Layard brought to light the extraordinary bass-reliefs of Koyunjik, a new chapter in the book of history was at once laid open. Not only the inscribed records, but the pursuits, the religious ceremonies and amusements, the modes of warfare and hunting, even the very dresses of a previously unknown people, were first exhibited to modern eyes. And though the inscriptions could not then be deciphered, though the mere style of art of the sculptures was not the least novel element in the strange discovery, still there could be little doubt respecting the antiquity of the monuments, or the purpose for which they were designed. The peculiar wedge-shaped character used in the inscriptions proved that the monuments belonged to a period preceding the conquest of Alexander; for it was known that, after the subjugation of Western Asia by the Macedonians, the cuneiform character fell into disuse; while the custom of recording events and promulgating edicts by inscriptions on stones, was also known to be of the very highest antiquity. Need we say that the divine commands were first given to man on tablets of stone. Job, too, it will be recollected, emphatically exclaims: 'Oh that my words were now written! . . . That they were graven with an iron pen and lead in the rock for ever!' Indeed, there could have been no less imperishable method of preserving important national records; and thus it is that the inscribed walls of palaces and rock-tablets have handed down to us, in these latter ages, the authentic history of ancient Assyria.

The character in which these inscriptions are written has been variously named, according to the fancies of different describers. Some term it the arrow-headed; the French, *ête-à-clou*, or nail-headed; the Germans, *keilformig*, equivalent to our phrase cuneiform, or wedge-shaped; and certainly this last most accurately expresses its peculiar form, each of the letters or syllables being composed of several distinct wedges united in certain combinations. It is considered probable that at first the letters were mere lines, and at a subsequent period the wedge-form was added to them, either as an embellishment, or to give them ideographic properties, similar to the picture-writing of the Egyptians. If the latter, however, were the case, all traces of their symbolical values are irretrievably lost. We may also add, that, like the Egyptians, the Assyrians at a later period of their history possessed a cursive writing of rounded characters, not unlike the Hebrew, which was employed for written documents, while the cuneiform was exclusively reserved for monumental purposes.

The cuneiform character, under certain modifications—the groups of characters representing syllables being diversely combined in different countries—was used over the greater part of Western Asia until, as we have already observed, the overthrow of the ancient Persian Empire by Alexander the Great. To this circumstance we mainly owe the very remarkable progress lately made in deciphering it. The Persian monarchs, previous to the conquest of Alexander, ruled over all the nations using this peculiar form of writing. These consisted of three principal peoples or races. Two of them, the Persian and the Tatar, spoke a dialect not very dissimilar to that still spoken by their descendants. The language of the third, the Babylonians, including the Assyrians, was allied to the Hebrew and Arabic, and totally different from that spoken by the two former races; moreover, it has been extinct and unknown for at least two thousand years. This last was the language which the decipherers of the Assyrian monuments had to reconstruct and reanimate from its equally obscure and long obsolete cuneiform characters. The first step towards the solution of so dark an enigma, was realised by the following circumstance. The Persian kings, when recording important events by inscriptions on stone tablets, used all the three languages spoken by their subjects. Thus originated the trilingual inscriptions of ancient Persia, the tablets containing them being divided into three columns, each written in a different language, and in the respective modification of cuneiform peculiar to each language, yet all three conveying one and the same meaning. The most celebrated of the trilingual inscriptions are found on the palaces of Darius and Xerxes at Persepolis, over the tomb of Darius, and on the rocks of Behistan. The latter, as aids to deciphering the Assyrian monuments, are the most important of any, as they record the principal events in the reign of Darius, and contain long lists of countries, cities, tribes, and kings; proper names being the only reliable index to the values of the cuneiform characters. The Persian version of the trilingual inscriptions, varying little from the modern Persian, having been translated, and its grammar and alphabet reduced to a certainty, a clue was gained to the Assyrian version, and from thence to the monuments discovered by Mr Layard. The clue thus obtained was followed up in defiance of the most formidable obstacles. To instance one, we may just mention that while the Persian modification of the cuneiform contains but thirty-nine signs, there are no less than four hundred in the Assyrian.

The various processes adopted to decipher the Assyrian inscriptions, from the slight clue we have just mentioned; the steps gradually made in the investigation; the going astray and the returning to,

or even the accidentally hitting on, the right path; in short, all the particulars relating to this most extraordinary search in the dark, are of the highest scientific and philological interest, though utterly unsuited for the pages of a popular journal. Nor shall we presume to venture an opinion on the disputed questions respecting the original discovery of the means employed for interpreting the Assyrian cuneiform, or whether it be a Semitic language or not. It must suffice for us to say, that the names of Sir Henry Rawlinson and Dr Hincks will ever be connected with this great triumph of our age and nation: less than a triumph it cannot be termed, for the investigation has been rewarded with complete success.

But though empires rise and fall, and tongues and tribes die out and disappear, still the race of the Van Twillers never becomes extinct: there always have been, and probably ever will be, many members of the family of the doubters. Consequently, though the decipherers of the Assyrian inscriptions detected on the strangely graven tablets the names of persons, cities, and nations, in historical and geographical series, and found them mentioned in proper connection with events recorded in sacred and profane history, still the doubters, gravely shaking their heads, refused to believe in the soundness of the system by which Dr Hincks and Sir Henry Rawlinson interpreted the mysteries of the cuneiform. Nor were the doubters without some show of reason for their unbelief. A great cause of difficulty in deciphering the cuneiform is what have been termed the variants—namely, different letters possessing the same alphabetic value, or, in other words, cuneiform groups representing a syllable, but not always the same syllable—sometimes one, and sometimes another. Accordingly, the doubters, not unreasonably, said that such a licence in the use of letters or syllables must be productive of the greatest uncertainty—that even the ancient Assyrians themselves could not have read a writing of so vague a description, and therefore the interpretations founded upon such a system must necessarily be fallacious. To this the decipherers replied, that experience has proved that the uncertainty arising from the variants is not so great as might be imagined. Most of the cuneiform groups having only one value, others having always the same value in the same word or phrase, so the remaining difficulties and uncertainties of reading are reduced within moderate limits. Besides, speaking practically, and taking into consideration the newness of the study, there is a fair amount of agreement between different interpreters of the Assyrian historical writings of average difficulty.

The doubters, however, not being satisfied, advantage was taken of an opportunity which lately occurred to test, as closely as possible, the truth of the system of decipherment adopted by Dr Hincks and Sir Henry Rawlinson, not only with the view of silencing the unbelievers, but also to prove that a correct basis of translation had been established, upon which other and future investigators could implicitly rely.

Her Majesty's government having sanctioned the trustees of the British Museum to publish lithographed copies of the most interesting Assyrian inscriptions, under the superintendence of Sir Henry Rawlinson; and Sir Henry having announced his intention of publishing translations of those lithographs, accompanied with transcriptions of the same into Roman letters, it occurred to Mr Fox Talbot that a desirable opportunity was thus offered to test the truth of the system. Accordingly, in March last, Mr Talbot prepared a translation of the first lithographed inscription, and transmitted it sealed to the Royal Asiatic Society, with a request that the Society would preserve it sealed, until Sir Henry's translation was published, and then compare the two—Mr Talbot considering that if any special agreement appeared between these

two independent versions, made by two different persons, without any communication with each other, such agreement must indicate that the versions had at least truth for their basis. The inscription selected for the purpose, a cylinder recording the achievements of Tiglath-pileser,* was exceedingly well suited for a comparison of this description, as it treats of various matters, changing abruptly from one to the other, and abounds in proper names, and statements of specific facts.

Upon the receipt of this communication, the council of the Society resolved that immediate measures should be taken to carry into effect the comparison suggested by Mr Talbot, but on a more extended scale. With this view, it was determined to request Sir Henry Rawlinson, Dr Hincks, and Dr Oppert to favour the Society with translations of the same inscription, to be sent, like Mr Talbot's, under a sealed cover, so that all four might be simultaneously opened, and compared by a committee appointed for the purpose. Application having been made to the above-named gentlemen, and they having heartily responded to the views of the Society, a committee, consisting of the Dean of St Paul's, Dr Whewell, Sir Gardner Wilkinson, Mr Grote, Mr Cureton, and Professor H. H. Wilson—than whom none better adapted could have been chosen—were requested to examine, and compare the four versions of the same inscription made by four different persons, in distant places, without mutual communication; and to determine how far these versions agreed in their general sense, and in the specific meanings assigned to the words.

The four translations having been forwarded to the Society, and carefully examined by the committee, the latter, having strictly compared them, certified 'that the coincidences between the translations, both as to the general sense and verbal rendering, were very remarkable.' In most parts, they found 'a strong correspondence in the meaning assigned, and occasionally a curious identity of expression as to particular words. Where the versions differed very materially, each translator had, in many cases, marked the passage as one of doubtful or unascertained signification. In the interpretation of numbers, there was throughout a singular correspondence.'

By all the translators, the inscription was understood to relate to King Tiglath-pileser, to his campaigns, building and consecration of temples, and other royal acts; campaigns against nations bearing names mostly analogous to those known from the sacred writings, and from other ancient authorities; temples to deities with appellations bearing the same resemblance to those found in other quarters. There was a constant recurrence of these words, names, and titles, yet a sufficient variety of words to test, to a certain degree, the extent of the knowledge claimed by the translators of the sound of the words, and of the language to which the words are supposed to belong. As a specimen of the inscription, and a fair average sample of the general concurrence existing among the four translations, the following versions of the same passage, with the names of the translators, may not be altogether devoid of interest to the reader:

Rawlinson.—Then I went on to the country of Comukha, which was disobedient and withheld the tribute and offerings due to Ashur my lord; I conquered the whole country of Comukha. I plundered their movables, their wealth, and their valuables. Their cities I burned with fire, I destroyed and ruined.

Talbot.—I then advanced against Kummikhi, a land of the unbelievers who had refused to pay taxes and tribute unto Ashur, my lord. The land of Kummikhi throughout all its extent I ravaged. Their women,

&c., I carried off. Their cities I burned with fire, destroyed, and overthrew.

Hincks.—At that time I went to a disaffected part of Qummukh, which had withheld the tribute by weight and tale belonging to Assur, my lord. I subdued the land of Qummukh as far as it extended. I brought out their women, their slaves, and their cattle; their towns I burned with fire, threw down, and dug up.

Oppert.—In these days I went to the people of Dummukh, the enemy who owed tributes and gifts to the god Asur, my lord. I subdued the people of Dummukh for its punishment (?). I took away their captives, their herds, and their treasures; their cities I burnt in fire; I destroyed, I undermined them.

The mere verbal expression of the purport of the above versions is certainly as close as could reasonably be expected from four different translations of any modern language. In some instances, however, the translators admitted that certain passages were obscure, and, indeed, the values of several common Assyrian words still remain to be established. Thus, where Pileser records his hunting exploits, Rawlinson makes the game 'wild buffaloes'; Hincks, 'wild elephants'; while Talbot, not venturing a translation, retains the original word, '*amasi*.' But in the general sense of killing or taking alive wild animals of some kind or other, they are all agreed. In a dead language, and more especially in one like the Assyrian, where symbolic signs are frequently used instead of phonetic letters, it is only natural to suppose that some words and names of persons, animals, or objects would be uncertain. Still, the occasional differences among the four translators, in the mode of interpreting certain words and sentences, may be accepted as a guarantee—if such were required—of the complete fairness of the undertaking, particularly when we find that those differences are uniform; the words or sentences so varying, having the same meaning assigned to them wherever they occur. A fair example of agreement and disagreement will be found in the following several translations of the closing paragraphs of the inscription, in which imprecations are denounced upon any future monarchs who may in any way deface the stone-engraved records of the mighty Tiglath:

Rawlinson.—Whoever shall injure my tablets and cylinders, or shall moisten them with water, or scorch them with fire, or expose them to the air, or in the holy place of God shall assign them a position where they cannot be seen or understood, or who shall erase the writing and inscribe his own name, or who shall divide the sculptures (?), and break them off from my tablets, Anu and Yen, the great gods my lords, let them consign his name to perdition; let them curse him with irrevocable curse; let them cause his sovereignty to perish; let them pluck out the stability of the throne of his empire.

Talbot.—But he who my stone tablets and my memorial records shall injure, or shall destroy them: with water shall efface them: or with fire shall consume them: or shall deface the writings: or shall write his name (*instead of mine*): or shall cut away the emblems: or who shall break in pieces the face of my tablets: May Anu and Yen, the great gods, my lords, utterly confound him; may their curses fall upon him; may they sweep away his kingly power; may his enemies carry off his royal throne.

Hincks.—He who shall hide or obliterate my tablets and my floors shall wander on the waters, shall be suspended in the fire, shall be besmeared with earth, shall be assigned by adjudication an unpleasant place in the excellent house on high. He shall survive few years, and shall write his name where some enemy shall speedily deface it, and shall have it (that is, the tablet containing it) broken against my tablets! May Anu and Yu, the great gods, my lords, energetically punish

him! and may they curse him with a *destroying* curse! May they *depress* his kingdom! may they remove . . . the throne of his dominion.

Oppert.—He who hides or defaces my tablets, and my angular stones, who throws them into the water, who burns them with fire, who spreads them to the winds, who transports them to the house of death, to a place without life, who steals the cylinders (?), who engraves on them his name, and . . . who injures my tablets: May Anu and Ao, the great gods, my lords, load his name with infamy; may they curse him with the worst imprecations! May they subdue his sister; may they deport the districts of his kingdom.

Upon the whole, the result of this very curious experiment—than which a fairer test could not, in all probability, be devised—may be considered as establishing, almost definitely, the correctness of the valuation of the characters of the Assyrian cuneiform inscriptions; and though it be quite possible that further researches may find something to alter or to add, still the greater portion, if not the whole of those remarkable records, may now be read with entire confidence. The almost invariable concurrence of the translators in the general sense, proves that they are agreed to give the same interpretation to the greater portion of the vocabulary. At the same time, the differences shew that a good deal remains to be effected ere the sense of every individual term can be confidently rendered. Where so much, however, has been accomplished in so short a period, and under such extraordinary difficulties, there surely is every reason to hope that the remaining uncertainties will ultimately and speedily be overcome. At all events, the ancient Assyrian language, with its grotesque, arrow-headed character, so inexplicable but a few years past, is, at the present time, nothing more than an unravelled mystery.

THE MISLETOE-BOUGH.

EVERY occupier in London, whether of house, floor, or attic, strains a point at Christmas to adorn his sashes and mantel-pieces with holly; and the hook in the ceiling, suggestive of a chandelier, but generally used to support the fly-trap, bears at this season the misletoe, and renders even the otherwise drear and chilly two-pair back a scene, for the time, of cheerfulness and mirth.

As to the demand and supply, no one troubles himself to consider from whence these masses of green stuff come. If the question is asked, the reply is prompt: 'Petty larceny and the suburbs of the metropolis.' This appears to be the conviction of all. Now, the larceny must be pretty extensive, as well as the suburbs, to supply our wants in this respect; and if even the churches alone depended on these sources, ill-fated Clapham and Haverstock Hill would have a rare time of it, and Leicester Square would soon surpass them in rural appearance and verdure.

But if we give the subject a moment's consideration, our curiosity will be awakened, and we shall be sent further afield, in quest of more extensive areas from whence to draw our Christmas garnishings than those so commonly suggested. Our supply of holly and misletoe does *not* come 'promiscuously'; it is a matter of commerce, and, as such, is regulated by the same rules and precise arrangements as the other branches of our commercial economy. Our requirements in this particular are as surely anticipated and carefully calculated as any other of our social wants; and the metropolitan supply of what is generally described by the general term of 'Christmas,' is as zealously cared for as the providing of our Christmas beef or summer strawberries. No deficiency is ever felt—no residue is left. The supply is adjusted to the demand, and the trade is of sufficient importance to engage men of capital and business minds; and thus

at a given time, and at a cheap rate, our sashes and mantel-pieces receive their due.

The south-western counties supply a goodly proportion of our Christmas; a considerable quantity comes even from Wales; large quantities from the neighbourhood of Bromley, Seven Oaks, and Maidstone. The weald of Kent also furnishes its quota; railways are called to lend a hand; and at length the mighty mass arrives at market, fresh, and but few berries the worse.

Market-gardeners, and others connected with London markets, tempted by the certain sale, keep a watchful eye during the year on all shrubberies, ready at a moment's notice to drive a bargain; and at the same time, in all probability, from prudent thinning, to improve the hedge.

Small hucksters range the country some time before Christmas, and bargain for holly, as it stands, to be cut and cleared at their convenience. These, in their turn, sell to larger dealers, who consign to their London customers; and thus, through divers channels, and wheels within wheels, we decorate our sashes and our mantel-shelves.

It is holly-morning at Covent Garden. The Tuesday before Christmas is sacred to the work. During the whole of the preceding night, wagons have been pouring in from all quarters, until every avenue to the market is choked up. Bedford Street and James Street are alone set apart for the vehicles of buyers. Every other nook and corner is jammed and crammed with carts and wagons, piled up as high as the second-floor windows with stacks of green-stuff.

In some parts, to save space, wagons are backed to the kerb, and are wedged together the whole length of the street; and with other contradictory arrangements, and no arrangements at all, a stranger, once within the meshes of the evergreen labyrinth, has but one thing to care for—and that is, how to find his way out.

St Paul's clock has chimed four—in a pitch-dark morning—and the ball opens in earnest. The eager salesmen stalk round the green stacks, flashing links fixed to the top of twelve-foot poles, and loudly descanting on the quality of their loads. Compared with theirs, the eloquence of Cheap Jacks and George Robinses sink into insignificance. They are assisted by two small boys, indispensable to every load, who are perched aloft on the stacks, and whose business it is to fish up, with long sticks, tempting bunches, which they hold out on end, with loud yells, and so serve to illustrate the florid statements of the salesman below. Amongst the buyers are found a large sprinkling of the fair sex, and these in nowise the most incapable of driving shrewd and hard bargains. At this time of the year, shops open later than usual. Husbands have taken the late trade and shutting-up business, whilst wives retire early, and take the morning market.

The bunches are bundled and weighed, and both the quantity of berries ascertained and the consequent freshness of the stuff; and it would excite no small surprise in the mind of a novice to see the amount of hard bargaining involved in the sale of that which many people believe may be had for the trouble of asking.

Loads of misletoe come to market worth thirty pounds each. The retail price ranges from one shilling and sixpence to three half-crowns per bunch; holly from ninepence to three shillings per bundle. Prices vary, of course, each season, dependent on the abundance or scarcity of the articles. The present season has been a prolific one, and prices have ruled accordingly.

It is now near seven o'clock, and the exhortations of the salesmen, the yells of the boys, the murmur of the crowd, and the imprecations of the porters as they endeavour to urge their heavy loads through the living

masses, are by this time half wearisome and half appalling, and the stranger finds it desirable to escape from the scene.

Nine o'clock, and the masses of evergreens have melted away; an hour or two later, and our houses are decorated with their 'Christmas,' and the faces of the busy Londoners brighten into smiles as they find themselves once more under the mistletoe-bough.

OCEOLA:

A ROMANCE.

CHAPTER XXV.—WHO FIRED THE SHOT?

'YELLOW JAKE?' I repeated, in the usual style of involuntary interrogative—of course without the slightest faith in my companion's statement. 'Saw Yellow Jake, you say?'

'Yes, Massr George,' replied my groom, getting a little over his fright: 'sure as de sun, I see 'im—eytha 'im or 'im ghost.'

'Oh, nonsense! there are no ghosts: your eyes deceived you under the shadow of the trees. It must have been an illusion.'

'By Gor! Massr George,' rejoined the black with emphatic earnestness, 'I swar I see 'im—'twant no daloosyun, I see—'twar eytha Yell' Jake or 'im ghost.' 'Impossible!'

'Den, massr, ef't be impossible, it am de troof. Sure as da gospel, I see Yell' Jake; he fire at you from ahind tha gum-tree. Den I fire at 'im. Sure, Massr George, you hear boaf de two shot?'

'True; I heard two shots, or fancied I did.'

'Gollys! massr, da wa'nt no fancy 'bout 'em. Whugh! no—da dam raskel he fire, sure. Lookee da, Massr George! What I say? Lookee da!'

We had been advancing towards the pond, and were now close to the magnolia under whose shade I had slept. I observed Jake in a stooping attitude under the tree, and pointing to its trunk. I looked in the direction indicated. Low down, on the smooth bark, I saw the score of a bullet. It had creased the tree, and passed onward. The wound was green and fresh, the sap still flowing. Beyond doubt, I had been fired at by some one, and missed only by an inch. The leaden missile must have passed close to my head where it rested upon the valise—close to my ears, too, for I now remembered that almost simultaneously with the first report, I had heard the 'whEEP' of a bullet.

'Now, you b'lieve um, Massr George?' interposed the black with an air of confident interrogation. 'Now you b'lieve dat dis chile see no daloosyun?'

'Certainly, I believe that I have been shot at by some one'—

'Yell' Jake, Massr George! Yell' Jake, by Gor!' earnestly asseverated my companion. 'I seed da yaller raskel plain's I see dat log afore me.'

'Yellow skin or red skin, we can't shift our quarters too soon. Give me the rifle: I shall keep watch while you are saddling. Haaste, and let us be gone!'

I speedily reloaded the piece; and, placing myself behind the trunk of a tree, turned my eyes in that direction whence the shot must have come. The black brought the horses to the rear of my position, and proceeded with all dispatch to saddle them, and buckle on our impedimenta.

I need not say that I watched with anxiety—with fear. Such a deadly attempt proved that a deadly enemy was near, whoever he might be. The supposition that it was Yellow Jake was too preposterous. I, of course, ridiculed the idea. I had been an eye-witness of his certain and awful doom; and it would have required stronger testimony than even the solemn declaration of my companion, to have given me faith either in a ghost or a resurrection. I had been fired

at—that fact could not be questioned—and by some one, whom my follower—under the uncertain light of the gloomy forest, and blinded by his fears—had taken for Yellow Jake. Of course this was a fancy—a mistake as to the personal identity of our unknown enemy. There could be no other explanation.

Ha! why was I at that moment dreaming of him—of the mulatto? And why such a dream? If I were to believe the statement of the black, it was the very realisation of that unpleasant vision that had just passed before me in my sleep.

A cold shuddering came over me—my blood grew chill within my veins—my flesh crawled, as I thought over this most singular coincidence. There was something awful in it—something so damnably probable, that I began to think there was truth in the solemn allegation of the black; and the more I pondered upon it, the less power felt I to impeach his veracity.

Why should an Indian, thus unpovoked, have singled me out for his deadly aim? True, there was hostility between red and white, but not war. Surely it had not yet come to this? The council of chiefs had not met—the meeting was fixed for the following day; and, until its result should be known, it was not likely that hostilities would be practised on either side. Such would materially influence the determinations of the projected assembly. The Indians were as much interested in keeping the peace as their white adversaries—ay, far more indeed—and they could not help knowing that an ill-timed demonstration of this kind would be to their disadvantage—just the very pretext which the 'removal' party would have wished for.

Could it, then, have been an Indian who aimed at my life? And if not, who in the world besides had a motive for killing me? I could think of no one whom I had offended—at least no one that I had provoked to such deadly retribution.

The drunken drovers came into my mind. Little would they care for treaties or the result of the council. A horse, a saddle, a gun, a trinket, would weigh more in their eyes than the safety of their whole tribe. Both were evidently true bandits—for there are robbers among red skins as well as white ones.

But no; it could not have been they? They had not seen us as we passed, or, even if they had, they could hardly have been upon the ground so soon? We had ridden briskly, after leaving them; and they were afoot.

Spence and Williams were mounted; and from what Jake had told me as we rode along in regard to the past history of these two 'rowdies,' I could believe them capable of anything—even of that.

But it was scarcely probable either: they had not seen us; and besides they had their hands full.

Ha! I guessed it at last; at all events I had hit upon the most probable conjecture. The villain was some runaway from the settlements, some absconding slave—perhaps ill-treated—who had sworn eternal hostility to the whites; and who was thus wreaking his vengeance on the first who had crossed his path. A mulatto, no doubt; and, may be, bearing some resemblance to Yellow Jake—for there is a general similarity among men of yellow complexion, as among blacks.

This would explain the delusion under which my companion was labouring; at all events, it rendered his mistake more natural; and with this supposition, whether true or false, I was forced to content myself.

Jake had now got everything in readiness; and, without staying to seek any further solution of the mystery, we leaped to our saddles, and galloped away from the ground.

We rode for some time with the 'beard on the shoulder;' and, as our path now lay through thin woods, we could see for a long distance behind us.

No enemy, white or black, red or yellow, made his appearance, either on our front, flank, or rear. We encountered not a living creature till we rode up to the stockade of Fort King;* which we entered, just as the sun was sinking behind the dark line of the forest horizon.

CHAPTER XXVI.

A FRONTIER FORT.

The word 'fort' calls up before the mind a massive structure, with angles and embrasures, bastions and battlements, curtains, casemates, and glacis—a place of great strength, for this is its essential signification. Such structures have the Spaniards raised—in Florida as elsewhere—some of which are still standing,† while others, even in their ruins, bear witness to the grandeur and glory that enveloped them at that time, when the leopard flag waved proudly above their walls.

There is a remarkable dissimilarity between the colonial architecture of Spain and that of other European nations. In America, the Spaniards built without regard to pains or expense, as if they believed that their tenure would be eternal. Even in Florida, they could have had no idea their lease was to be so short—no forecast of so early an ejection.

After all, these great fortresses served them a purpose. But for their protection, the dark Yamasee, and, after him, the conquering Seminole, would have driven them from the flowery peninsula long before the period of their actual rendition.

The United States has its great stone fortresses; but far different from these are the 'forts' of frontier phraseology, which figure in the story of border wars, and which at this hour gird the territory of the United States as with a gigantic chain. In these are no grand battlements of cut rock, no costly casemates, no idle ornaments of engineering. They are rude erections of hewn logs, of temporary intent, put up at little expense, to be abandoned with as little loss—ready to follow the ever-flitting frontier in its rapid recession.

Such structures are admirably adapted to the purpose which they are required to serve. They are types of the utilitarian spirit of a republican government, not permitted to squander national wealth on such costly toys as Thames Tunnels and Britannia Bridges, at the expense of an overtaxed people. To fortify against an Indian enemy, proceed as follows:

Obtain a few hundred trees; cut them to lengths of eighteen feet; split them up the middle; set them in a quadrangle side by side, flat faces inward; batten them together; point them at the tops; loophole eight feet from the ground; place a staging under the loopholes; dig a ditch outside; build a pair of bastions at alternate corners, in which plant your cannon; hang a strong gate—and you have a 'frontier fort.'

It may be a triangle, a quadrangle, or any other polygon best suited to the ground.

You need quarters for your troops and stores. Build strong block-houses within the enclosure—some at the angles, if you please; loophole them also—against the contingency of the stockade being carried; and this done, your fort is finished.

Pine-trees serve well. Their tall, branchless stems are readily cut and split to the proper lengths; but in Florida is found a timber still better for the purpose—in the trunk of the 'cabbage palm.'‡ These, from the peculiarity of their endogenous texture, are less liable to be shattered by shot, and the bullet buries itself harmlessly in the wood. Of such materials was Fort King.

* Called after a distinguished officer in the American army. Such is the fashion in naming the frontier posts.

† Forts Picolata on the St Johns, Fort San Augustine, and others at Pensacola, St Marks, and elsewhere.

‡ *Chamærops palmæto*.

Fancy, then, such a stockade fort. People it with a few hundred soldiers—some in jacket uniforms of faded sky-colour, with white facings, sadly dimmed with dirt (the infantry); some in darker blue, bestriped with red (artillery); a few adorned with the more showy yellow (the dragoons); and still another few in the sombre green of the rifles. Fancy these men lounging about, or standing in groups, in slouched attitudes, and slouchingly attired—a few of tidier aspect, with pipe-clayed belts and bayonets by their sides, on sentry, or forming the daily guard—some half-score of slattern women, their laundress-wives, mingling with a like number of brown-skinned squaws—a sprinkling of squalling brats—here and there an officer hurrying along, distinguished by his dark-blue undress frock*—half-a-dozen gentlemen in civilian garb—visitors or non-military *attachés* of the fort—a score less gentle-looking—sutlers, beef-contractors, drovers, butchers, guides, hunters, gamblers, and idlers—some negro servants and friendly Indians—perhaps the pompous commissioner himself—fancy all these before you, with the star-spangled flag waving above your head, and you have the *coup d'ail* that presented itself as I rode into the gateway of Fort King.

Of late not much used to the saddle, the ride had fatigued me. I heard the *reveille*, but not yet being ordered on duty, I disregarded the call, and kept my bed till a later hour.

The notes of a bugle bursting through the open window, and the quick rolling of drums, once more awoke me. I recognised the parade music, and sprang from my couch. Jake at this moment entered to assist me in my toilet.

'Golly, Masser George!' he exclaimed, pointing out by the window: 'looksee dar! dar's tha whole Indy-en ob tha Seminole nayshun—ebbery red skin dar be in ole Florida. Whugh!'

I looked forth. The scene was picturesque and impressive. Inside the stockade, soldiers were hurrying to and fro—the different companies forming for parade. They were no longer, as on the evening before, slouched and loosely attired; but, with jackets close buttoned, caps jauntily cocked, belts pipe-clayed to a snowy whiteness, guns, bayonets, and buttons gleaming under the sunlight, they presented a fine military aspect. Officers were moving among them, distinguished by their more splendid uniforms and shining epaulets; and a little apart stood the general himself, surrounded by his staff, conspicuous under large black chapeaus with nodding plumes of cock's feathers, white and scarlet. Alongside the general was the commissioner—himself a general—in full government uniform.

This grand display was intended for effect on the minds of the Indians.

There were several well-dressed civilians within the enclosure, planters from the neighbourhood, among whom I recognised the Ringgolds.

So far the impressive. The picturesque lay beyond the stockade.

On the level plain that stretched to a distance of several hundred yards in front, were groups of tall Indian warriors, attired in all their savage finery—turbaned, painted, and plumed. No two were dressed exactly alike, and yet there was a similarity in the style of all. Some wore hunting-shirts of buckskin, with leggings and moccasins of like material—all profusely fringed, beaded, and tasselled; others were clad in tunics of printed cotton stuff, checked or flowered, with leggings of cloth, blue, green, or scarlet, reaching from hip to ankle, and girt below the knee with bead-

* An American officer is rarely to be seen in full uniform—still more rarely when on campaigning service, as in Florida.

embroidered gaiters, whose tagged and tasselled ends hung down the outside of the leg. The gorgeous wampum belt encircled their waists, behind which were stuck their long knives, tomahawks, and in some instances pistols glittering with a rich inlay of silver—relics left them by the Spaniards. Some, instead of the Indian wampum, encircled their waists with the Spanish scarf of scarlet silk, its fringed extremities hanging square with the skirt of the tunic, adding gracefulness to the garment. A picturesque head-dress was not wanting to complete the striking costume; and in this the variety was still greater. Some wore the beautiful coronet of plumes—the feathers stained to a variety of brilliant hues; some the 'toque' of checked 'bandanna'; while others wore shako-like caps of fur—of the black squirrel, the bay lynx, or racoon—the face of the animal often fantastically set to the front. The heads of many were covered with broad fillets of embroidered wampum, out of which stood the wing-plumes of the king-vulture, or the gossamer feathers of the sand-hill crane. A few were still further distinguished by the nodding plumes of the great bird of Afric.

All carried guns—the long rifle of the backwoods hunter, with horns and pouches slung from their shoulders. Neither bow nor arrow was to be seen, except in the hands of the youth—many of whom were upon the ground, mingling with the warriors.

Further off, I could see tents, where the Indians had pitched their camp. They were not together, but scattered along the edge of the wood, here and there in clusters, with banners floating in front—denoting the different clans or sub-tribes to which each belonged.

Women in their long frocks could be seen moving among the tents, and little dark-skinned 'papooses' were playing over the grassy sward in front of them.

When I first saw them, the warriors were assembling in front of the stockade. Some had already arrived, and stood in little crowds conversing, while others strode over the ground, passing from group to group, as if bearing words of counsel from one to the other.

I could not help observing the upright carriage of these magnificent men. I could not help admiring their full free port, and contrasting it with the gingerly step of the drilled soldier! No eye could have looked upon both without acknowledging this superiority of the *savage*.

As I glanced along the line of Saxon and Celtic soldiery—starched and stiff as they stood, shoulder to shoulder, and heel to heel—and then looked upon the plumed warriors without, as they proudly strode over the sward of their native soil, I could not help the reflection, that to conquer these men we must needs outnumber them!

I should have been laughed at had I given expression to the thought. It was contrary to all experience—contrary to the burden of many a boasting legend of the borders. The Indian had always succumbed; but was it to the superior strength and courage of his white antagonist? No; the inequality lay in numbers—oftener in arms. This was the secret of our superiority. What could avail the wet bowstring and ill-sized shaft against the death-dealing bullet of the rifle?

There was no inequality now. Those hunter-warriors carried the fire-weapon, and could handle it as skilfully as we.

The Indians now formed into a half-circle in front of the fort. The chiefs, having aligned themselves so as to form the concave side of the curve, sat down upon the grass. Behind them, the sub-chiefs and more noted warriors took their places, and still further back, in rank after rank, stood the common men of the tribes. Even the women and boys drew near, clustering thickly behind, and regarding the movements of the men with quiet but eager interest.

Contrary to their usual habits, they were grave and

silent. It is not their character to be so; for the Seminole is as free of speech and laughter as the clown of the circus ring; even the light-hearted negro scarcely equals him in joviality.

It was not so now, but the very reverse. Chiefs, warriors, and women—even the boys who had just forsaken their play—all wore an aspect of solemnity.

No wonder. That was no ordinary assemblage—no meeting upon a trivial matter—but a council at which was to be decided one of the dearest interests of their lives—a council whose decree might part them for ever from their native land. No wonder they did not exhibit their habitual gaiety.

It is not correct to say that all looked grave. In that semicircle of chiefs were men of opposite views. There were those who wished for the removal—who had private reasons to desire it—men bribed, suborned, or tampered with—traitors to their tribe and nation.

These were neither weak nor few. Some of the most powerful chiefs had been bought over, and had agreed to sell the rights of their people. Their treason was known or suspected, and this it was that was causing the anxiety of the others. Had it been otherwise—had there been no division in their ranks—the patriot party might easily have obtained a triumphant decision; but they feared the defection of the traitors.

The band had struck up a march—the troops were in motion, and filing through the gate.

Hurrying on my uniform, I hastened out; and took my place among the staff of the general.

A few minutes after, we were on the ground, face to face with the assembled chiefs.

The troops formed in line, the general taking his stand in front of the colours, with the commissioner by his side. Behind these were grouped the officers of the staff, with clerks, interpreters, and some civilians of note—the Ringolds, and others—who, by courtesy, were to take part in the proceedings.

Hands were shaken between the officers and chiefs; the friendly calumet was passed round; and the council at length inaugurated.

CHAPTER XXVII.

THE COUNCIL.

First came the speech of the commissioner.

It is too voluminous to be given in detail. Its chief points were, an appeal to the Indians to conform peaceably to the terms of the Oclawaha treaty—to yield up their lands in Florida—to move to the west—to the country assigned them upon the White River of Arkansas—in short, to accept all the terms which the government had commissioned him to require.

He took pains to specify the advantages which would accrue from the removal. He painted the new home as a perfect paradise—prairies covered with game, elk, antelopes, and buffalo—rivers teeming with fish—crystal waters, and unclouded skies. Could he have found credence for his words, the Seminole might have fancied that the happy hunting-grounds of his fancied heaven existed in reality upon the earth.

On the other hand, he pointed out to the Indians the consequences of their non-compliance. White men would be settling thickly along their borders. Bad white men would enter upon their lands; there would be strife, and the spilling of blood; the red man would be tried in the court of the white man, where, according to law, his oath would be of no avail; and *therefore* he must suffer injustice!

Such were in reality the sentiments of Mr Commissioner Wiley Thompson,* uttered in the council of Fort King, in April 1885. I shall give them in his own words: they are worthy of record, as a specimen of *fair dealing* between white and red. Thus spoke he:

* Historically true.

'Suppose—what is, however, impossible—that you could be permitted to remain here for a few years longer, what would be your condition? This land will soon be surveyed, sold to, and settled by the whites. *There is now a surveyor in the country.* The jurisdiction of the government will soon be extended over you. Your laws will be set aside—your chiefs will cease to be chiefs. Claims for debt and for your negroes would be set up against you by bad white men; or you would perhaps be charged with crimes affecting life. You would be hailed before the white man's court. The claims and charges would be decided by the white man's law. White men would be witnesses against you. Indians would not be permitted to give evidence. Your condition in a few years would be hopeless wretchedness. You would be reduced to abject poverty, and when urged by hunger to ask—perhaps from the man who had thus ruined you—for a crust of bread, you might be called an Indian dog, and spurned from his presence. For this reason it is that your "Great Father (1)" wishes to remove you to the West—to save you from all these evils.'

And this language in the face of a former treaty—that of Camp Moultrie—which guaranteed to the Seminoles their right to remain in Florida, and the third article of which runs thus:

'The United States will take the Florida Indians under their care and patronage; and will afford them protection against all persons whatsoever.'

O tempora, O mores!

The speech was a mixture of sophistry and implied menace—now uttered in the tones of a petitioner, anon assuming the bold air of the bully. It was by no means clever—both characters being overdone.

The commissioner felt no positive hostility towards the Seminoles. He was indignant only with those chiefs who had already raised opposition to his designs, and one, in particular, he *hated*; but the principal *animus* by which he was inspired, was a desire to do the work for which he had been delegated—an ambition to carry out the wish of his government and nation, and thus gain for himself credit and glory. At this shrine he was ready—as most officials are—to sacrifice his personal independence of thought, with every principle of morality and honour. What matters the cause so long as it is the king's? Make it 'congress' instead of 'king's, and you have the motto of our Indian agent.

Shallow as was the speech, it was not without its effects. The weak and wavering were influenced by it. The flattering sketch of their new home, with the contrasted awful picture of what might be their future condition, affected the minds of many. During that spring the Seminoles had planted but little corn. The summons of war had been sounding in their ears; and they had neglected seed-time: there would be no harvest—no maize, nor rice, nor yams. Already were they suffering from their improvidence. Even then were they collecting the roots of the China briar,* and the acorns of the live-oak. How much worse would be their condition in the winter?

It is not to be wondered at that they gave way to apprehension; and I noticed many whose countenances bore an expression of awe. Even the patriot chiefs appeared to evince some apprehension for the result.

They were not dismayed, however. After a short interval, Hoitle-mattee, one of the strongest opponents of the removal, rose to reply. There is no order of precedence in such matters. The tribes have their acknowledged orators, who are usually permitted to express the sentiments of the rest. The head-chief was present, seated in the middle of the ring, with a

British crown upon his head—a relic of the American revolution. But 'Onopa' was no orator, and waved his right to reply in favour of Hoitle-mattee—his son-in-law.

The latter had the double reputation of being a wise councillor and brave warrior; he was, furthermore, one of the most eloquent speakers in the nation. He was the 'prime-minister' of Onopa, and, to carry the comparison into classic times, he might be styled the Ulysses of his people. He was a tall, spare man, of dark complexion, sharp aquiline features, and somewhat sinister aspect. He was not of the Seminole race, but, as he stated himself, a descendant of one of the ancient tribes who peopled Florida in the days of the early Spaniards. Perhaps he was a Yamasee, and his dark skin would favour this supposition.

His powers of oratory may be gathered from his speech:

'At the treaty of Moultrie, it was engaged that we should rest in peace upon the land allotted to us for twenty years. All difficulties were buried, and we were assured that if we died, it should not be by the violence of the white man, but in the course of nature. The lightning should not rive and blast the tree, but the cold of old age should dry up the sap, and the leaves should wither and fall, and the branches drop, and the trunk decay and die.

'The deputation stipulated at the talk on the Oclawaha to be sent on the part of the nation, was only authorised to examine the country to which it was proposed to remove us, and bring back its report to the nation. We went according to agreement, and saw the land. It is no doubt good land, and the fruit of the soil may smell sweet, and taste well, and be healthy, but it is surrounded with bad and hostile neighbours, and the fruit of bad neighbourhood is blood that spoils the land, and fire that dries up the brook. Even of the horses we carried with us, some were stolen by the Pawnees, and the riders obliged to carry their packs on their back. You would send us among bad Indians, with whom we could never be at rest.

'When we saw the land, we said nothing; but the agents of the United States made us sign our hands to a paper which you say signified our consent to remove, but we considered we did no more than say we liked the land, and when we returned, the nation would decide. We had no authority to do more.

'Your talk is a good one, but my people cannot say they will go. The people differ in their opinions, and must be indulged with time to reflect. They cannot consent now; they are not willing to go. If their tongues say yes, their hearts cry no, and call them liars. We are not hungry for other lands—why should we go and hunt for them? We like our own land, we are happy here. If suddenly we tear our hearts from the homes round which they are twined, our heart-strings will snap. We cannot consent to go—we will not go!'

A chief of the removal party spoke next. He was 'Omatla,' one of the most powerful of the tribe, and suspected of an 'alliance' with the agent. His speech was of a pacific character, recommending his red brothers not to make any difficulty, but to act as honourable men, and comply with the treaty of the Oclawaha.

It was evident this chief spoke under restraint. He feared to shew too openly his partiality for the plans of the commissioner, dreading the vengeance of the patriot warriors. These frowned upon him as he stood up, and he was frequently interrupted by Arpiucki, Coa Hajo, and others.

A bolder speech, expressing similar views, was delivered by Lusta Hajo (the Black Clay). He added little to the argument; but by his superior daring, restored the confidence of the traitorous party and the

* *Smilax pseudo-China*. From its roots the Seminoles make the *conté*, a species of jelly—a sweet and nourishing food.

equanimity of the commissioner, who was beginning to exhibit signs of impatience and excitement.

'Holata Mico' next rose on the opposite side—a mild and gentlemanly Indian, and one of the most regarded of the chiefs. He was in ill health, as his appearance indicated; and in consequence of this, his speech was of a more pacific character than it might otherwise have been; for he was well known to be a firm opponent of the removal.

'We come to deliver our talk to-day. We were all made by the same GREAT FATHER; and are all alike his children. We all came from the same mother; and were suckled at the same breast. Therefore, we are brothers; and, as brothers, should not quarrel and let our blood rise up against each other. If the blood of one of us, by each other's blow, should fall upon the earth, it would stain it, and cry aloud for vengeance from the land wherever it had sunk, and call down the frown and the thunder of the great spirit. I am not well. Let others who are stronger speak, and declare their minds.'

Several chiefs rose successively and delivered their opinions. Those for removal followed the strain of Omatla and the Black Clay. They were 'Ohala' (the big warrior), the brothers Itolasse and Charles Omatla, and a few others of less note.

In opposition to these, spoke the patriots 'Acola,' 'Yaha Hajo' (mad wolf), 'Echa Maita' (the water-serpent), 'Poshalla' (the dwarf), and the negro 'Abram.' The last was an old 'refugee,' from Pensacola; but now chief of the blacks living with the Micosauc* tribe, and one of the counsellors of Onopa, over whom he held supreme influence. He spoke English fluently; and at the council—as also that of the Oclawaha—he was the principal interpreter on the part of the Indians. He was a pure negro, with the thick lips, prominent cheek-bones, and other physical peculiarities of his race. He was brave, cool, and sagacious; and though only an adopted chief, he proved to the last the true friend of the people who had honoured him by their confidence. His speech was brief and moderate; nevertheless, it evinced a firm determination to resist the will of the agent.

As yet, the 'king' had not declared himself, and to him the commissioner now appealed. Onopa was a large, stout man, of somewhat dull aspect, but not without a considerable expression of dignity. He was not a man of great intellect, nor yet an orator; and although the head 'mico' of the nation, his influence with the warriors was not equal to that of several chiefs of inferior rank. His decision, therefore, would by no means be regarded as definitive, or binding upon the others; but being nominally 'mico-mico' or chief-chief, and actually head of the largest clan—the Micosauca—his vote would be likely to turn the scale, one way or the other. If he declared for the removal, the patriots might despair.

There was an interval of breathless silence. The eyes of the whole assemblage, of both red men and white men, rested upon the king. There were only a few who were in the secret of his sentiments; and how he would decide, was to most of those present a matter of uncertainty. Hence the anxiety with which they awaited his words.

At this crisis a movement was observed among the people who stood behind the king. They were making way for some one who was passing through their midst. It was evidently one of authority, for the crowd readily yielded him passage.

The moment after, he appeared in front—a young warrior, proudly caparisoned, and of noble aspect. He wore the insignia of a chief; but it needed not this

to tell that he was one: there was that in his look and bearing which at once pronounced him a leader of men.

His dress was rich, without being frivolous or gay. His tunic, embraced by the bright wampum sash, hung well and gracefully; and the close-fitting leggings of scarlet cloth displayed the perfect sweep of his limbs. His form was a model of strength—terse, well-knit, symmetrical. His head was turbaned with a shawl of brilliant hues; and from the front rose three black ostrich plumes, that drooped backward over the crown till their tips almost touched his shoulders. Various ornaments were suspended from his neck; but one upon his breast was conspicuous. It was a circular plate of gold, with lines radiating from a common centre. It was a representation of the rising sun.

His face was stained of a uniform vermilion red; but despite the levelling effect of the dye, the lineaments of noble features could be traced. A well-formed mouth and chin, thin lips, a jawbone expressive of firmness, a nose slightly aquiline, a high, broad forehead, with eyes that, like the eagle's, seemed strong enough to gaze against the sun.

The appearance of this remarkable man produced an electric effect upon all present. It was similar to that exhibited by the audience in a theatre on the *entrées* of the great tragedian for whom they have been waiting.

Not from the behaviour of the young chief himself—withal right modest—but from the action of the others, I perceived that he was in reality the hero of the hour. The *dramatis personæ* who had already performed their parts were evidently but secondary characters; and this was the man for whom all had been waiting.

There followed a movement—a murmur of voices—an excited tremor among the crowd—and then, simultaneously, as if from one throat, was shouted the name:

'OCEOLA!'

CAPTAIN VERSUS CREW.

THE traditional sailor has a place only in the melodrama. There he rolls about the stage like a graceful porpoise, shivering his timbers, and scattering his money with a feeling of equal benevolence, faithful alike to his lass and his grog, and ready at any moment to sink with his ship, to him the Image of a Catholic idolatry, the symbol of love, loyalty, and honour. The actual sailor is not so fine an animal by half. He is still brave, still fond of battle at the rare time he can get it; but the traditions, of which he once formed a part, are gone, and the poetical part of his character is gone with them. The ship is now too costly for a rough seaman's devotion. Since it cannot be floated about the waters in a handbox, it must be anxiously taken care of, and kept quite out of the way of rocks, shells, and other marine curiosities. The money value of a thing is what Jack is taught to venerate, and the lesson goes home to his own business and bosom. His wages occupy his thoughts, in the way of getting, not spending; his very grog is to some extent stopped, and he gets elevated instead with books; and even his unthinking lass, disliking the prosaic turn he has taken, deserts him for the song-making shoemaker or the taproom-haunting tailor. All influences, whether of soul or sense, whether good or bad, work against the sailor, because they are all jumbled and inconsistent.

For some time past, a new source of sympathy has been sought to be opened on his behalf. The captain turns out to be a sea-ogre, and the moment the innocent and unhappy crew are in blue water, they are subjected to all manner of cruelties and tyrannies. Sometimes they are even driven to mutiny, and melodramatic Jack, for this enforced infidelity to his salt

* The Micosauc (Mikonsauke) or tribe of the 'redstick' was the largest and most warlike clan of the nation. It was under the immediate government of the head-chief Onopa—usually called 'Miconopa.'

(water), finishes the voyage in irons. Unluckily, however, as it is now said, the insubordinate spirit of the crew goes on all the same, whatever be the character of the captain; and in the merchant-service, more especially, it is described as getting worse every day, and that from the most mean and sordid motives. The subject is treated incidentally in a pamphlet printed in Bombay by W. Walker of that city, the object of which is to examine critically the various descriptions of goods imported into India from this country.* Mr Walker seems to be a man of large experience—'an experience,' he tells us, 'gathered at sea and on shore, in the army, in the navy, and the merchant-service, in all quarters of the globe'—and as he has now retired into some civil employment connected with ships and merchandise, his testimony is the more trustworthy.

Our author by no means denies the existence of tyrannical captains, and it would be absurd to do so. Why should there not be tyrants at sea as well as on shore? Why should there not be tyrants in ships as well as in barracks, warehouses, and mills? Mr Walker, however, denies that salt water breeds more ogres than solid land. He says that in the course of his own multifarious experience, he never met with more than one cruel captain, and he was in the navy; and that he never heard from man or boy he sailed with 'that he had ever experienced much rougher fortune.' Public sympathy and public indignation are awakened, then, by exceptional cases which, occurring at sea, and in the peculiar community thrown together in a ship, have a strong and strange interest of their own.

It was thought that the Mercantile Marine Act of 1850 had defined and protected the respective rights of captains and seamen; but the puzzling thing is, that it is precisely since then that the semi-mutinous conduct of the crew has grown to the worst, while the bearing of the officers has become more refined and gentlemanly. We would suggest in explanation, that the difference may be merely that of education—that the officers understand their position, while the more ignorant men abuse their advantages, since they enjoy them in spite of their superiors. But a more alarming change is behind. 'Not only has the conduct of the seamen deteriorated,' says Mr Walker, 'but they are deficient in seamanship as compared with sailors of ten or fifteen years ago, and to an extent which is quite startling to old-salts. I do not exaggerate in putting forward these opinions. I feel confident that the truth can be vouched for by many foremast hands themselves, and certainly by all commanders of ships now serving, as well as those who have retired from a maritime life.'

One cause of this unhappy change seems to be the partial abandonment of the apprenticeship system—a system which is no longer compulsory. 'It is but just to observe that many shipowners were far-sighted enough not to avail themselves of this privilege, as they probably well knew that unless they trained sealads they would fall off in the number of seamen to man their ships. This has now come to pass; and the captains of ships are loud in their complaints as to the want of seamanship in men who now unblushingly enter ships as able seamen, and when they get to sea the captain finds they are unable to take the helm, or a cast of the lead.' The apprentice system, thus left to the discretion of the shipowners, has *offered* our ships; or, as Mr Walker expresses it, 'has found a captain for every one of the splendid fleet of merchant-ships (100 sail) now in our harbour' (Bombay). And what are the qualifications demanded in these captains, requiring the development of apprenticeship? 'A captain is required to be well versed in navigation in

all its branches, from plane trigonometry to great circle-sailing, and from finding the latitude by a meridian altitude to the longitude by a lunar observation. He must be able to conduct his ship to all parts of the world, and to keep her clear of lee-shores, rocks, shoals, and sand-banks. Many captains are even kept on shore by owners to see a new ship built from keel to top-rail. By this experience, thus gained, he becomes an adept in applying a remedy when a defect appears. He must be perfectly acquainted with various trades, such as sailmaker, carpenter, cooper, blacksmith, and sometimes cook. As a doctor, he has to prescribe medicines for his crew, and if, like his prototype on shore, he kills his patient, as a clergyman he has to read the funeral-service over his remains. He must be thoroughly conversant with the maritime laws of all nations. Many of them are invested with the full duties of the merchant, in which capacity he has to exhibit the care and cunning of the lawyer in drawing charter-parties, bills of lading, &c. He is supposed to be a kind and humane man, slow to anger, and of great command of temper; he must on no account ever allow himself to be so irritated as to lift his hand (be the provocation ever so great) against one of his crew. So sure as he does, *the poor ill-treated (and insolent) sailor* gets public sympathy, and a reward for his conduct; while the *brutal captain* gets either a heavy fine or imprisonment, or both, and public censure, for his conduct, without any consideration as to the heavy responsibility, anxiety, and frequent difficulty of governing unruly crews.'

What is the difficulty of governing unruly crews? Is it not looked to in the Mercantile Marine Act? To this extent—that insolence or contemptuous language or behaviour to the master or any mate, is punishable by a fine of one day's pay; and striking or assaulting any person on board, two days' pay. An unruly sailor, therefore, is kept in check by the knowledge that he cannot indulge in pummelling his captain at a smaller expense than three shillings and fourpence. When the captain imposes the fine, he is obliged to enter the crime in the log-book, call the offender into the cabin, and read the entry to him. This is still more injurious to discipline than the inadequacy of the punishment; for it shews the ruffian that nothing is trusted to the captain, that his displeasure is of no consequence, except in the literal matter of the three shillings and fourpence. The captain is thus reduced to a state of helplessness: he has no power like him of the navy to enforce his orders; and he is deprived by the laws of the prestige which formerly served as his protection. The Mutiny Act, for extreme cases, is the sole guard of life and ship.

Melodramatic Jack is content and ready to sink with his ship whenever her time comes; but actual Jack has no ship in particular to sink with. He changes every voyage, if he can, and gets up a row to accomplish it. 'The modern merchant-sailor ships in a vessel for a foreign port, and as soon as cables are unbent and anchors stowed, he is ready for his game of insolent insubordination, with a view to his discharge and re-entry into some other service that may captivate his vagrant fancy.' If he can find no fault with the captain, and if the ship is unexceptionable, he has recourse to the bad-provision dodge; and in some cases he is known to have himself tampered with the articles complained of to gain a verdict. But money is the grand motive for leaving his ship. 'When a seaman enters this port, and learns that, whilst he is working for L.3, 10s. a month, the wages given out of Bombay is L.4, he braces up his mind for a row, refusal to do duty, and their consequent penalties—the shadiest wall lounge of the House of Correction, where he can smoke the calumet of peace without its moral binding conditions.' This costs him but a trifle of the wages due to him, and when the pleasant incarceration is

* *Facts for Factories; being Letters on Practical Subjects, suggested by Experiences in Bombay.* Printed at the Education Society's Press, Byculla. 1857.

expired, he finds no difficulty in shipping anew at an improved rate of wages. It is no wonder that we read, as a corollary from all this, that 'American captains will not have anything to do with the modern English merchant-seaman if they can help it. They hunt out the quiet Belgian, and orderly Dane or Norwegian.'

All this, we repeat, is very alarming, even if we make every possible deduction on the score of that exaggeration men are frequently betrayed into when advocating a theory. An evil, however, brought about in the course of a few years is not irremediable. There is good stuff in the seaman to work upon yet; and we would point to his conduct in the Crimea and in India as evidence of his value even on shore. It is for this reason we lend our aid to draw attention to the heavy charge made against him, that it may lead to investigation and reform.

Mr Walker advises a general return to the apprenticeship system; and not only that, but the establishment in every naval port of a training-ship for boys. By this means, we should have abundance of well-trained orderly seamen in readiness for any emergency, instead of having 'to man our Baltic fleet with 'long-shore riffraff, the spawn of unsuccessful gold-diggers, tempered by a few good and orderly seamen from the Coast-guard, torn from domestic homes and ties.' On board ship he would have the officers repress by every means in their power the filthy and blasphemous language which is the vernacular of the sea, and likewise endeavour to get the men to wear cleaner skins and clothes; since nothing brutalises the mind more than dirty skins and dirty language. Fresh water should be provided, when possible, for ablution and clothes-washing. Divine service should be performed every Sunday, when the weather permits. By means of the American plan of deck-houses, the crew should be emancipated from the dark dungeon of the fore-castle. 'Great ingenuity is displayed in making berths for emigrants when a government commands it. Why should the owner not command the like conveniences for the crews of his ships—the winners of his fortune?' In fine, the captains themselves should be informed that it is mean and dishonest to give the ruffians and bullies of the ship, when the crew are paid off—which they generally do, either from easiness of character or fear of revenge—a V. G. (very good) certificate. Without this certificate, no merchant-captain would employ them; but the 'registrar might give our repudiated man a hint that the *Regenerator* frigate, *Captain Curran*, would enter his name on her books, and no questions asked. He would then learn to crack his biscuit, and live like a good seaman—or taste the * * *. This suggestion might be carried out to-morrow, and would work silently and with certain success.'

A LANCASHIRE INCUMBENT.

It is an old saying, and a true one, that no one knows what he can do till he tries. I am quite sure that powers, of vast capability if called into action, are suffered to lie dormant, either because their possessor may not be aware of their existence, or of his own ability to use them with effect. I remember to have somewhere met with an account of a clergyman, in the English lake district, who was called 'Wonderful Robert Walker,' from the astonishing quantity of work he contrived to get through in a given period. He was the doctor, the accountant, the schoolmaster, as well as the minister of his parish. He was also a mechanic-of-all-work; and his pew in church was lined with cloth span and woven, I believe, by his own hands. But this ancient wonder is, like many others, quite superseded by some occurring in our own

marvellous day. The brazen colossus at Rhodes is not more outdone by the Victoria Bridge, than is 'Wonderful Walker' by the modern phenomenon, 'a Lancashire incumbent.'

Within the last two years, a great newspaper had roundly charged the English clergy with gross negligence and laxity in carrying out the objects of their mission among the people. We are not going to introduce here any discussion as to the justice of this charge: all we shall say is, that it evoked a reply from a correspondent, who signed himself as above, giving a report of his work within the year then past; and that the same Incumbent has again sent in his *compte rendu* at the close of 1857—on which document I propose to offer a few observations.

Altogether apart from the special calling of the writer, this letter of the incumbent is a highly instructive study to professional young men of every sort. The first lesson which is taught by the fact that such a vast amount of work may be done by one man in a certain time, is, that the mainspring of such successful exertion must be regularity, and a systematic division and employment of time. The second is, that monotony of labour must be avoided; for a change of occupation will often afford recreation as resting and effectual as idleness itself.

'I am still the incumbent of a new parish in a large town; and attached to my own church, which is one of forty within the borough limits, there is a population of 8500.' 'I reside a mile and a quarter from my church and schools. During the year, I was absent on business connected with public objects, 18 days; was unwell—including a fortnight's detention from an accident—26; was kept in the house by bad weather, 4; and took 29 holidays. This leaves 288 to be accounted for, of which I was in the parish on duty, on 168 separate days, 249 times.' 'I have made 1086 visits to the people in their houses, independent of calls on the sick, and others of an incidental kind. I have preached 121 sermons, of which 21 were in other churches—namely, 8 for schools and charities, 3 for religious societies, and 15 in exchange or aid.'

Such is the summary of work done on those 288 days, including the 52 Sabbaths, which must have demanded no small share of mental as well as bodily vigour, no less than a very systematic method of proceeding. One would feel disposed to say that little or no more than this could have been done in the time, and that all relaxation in the enjoyment of society, or application to reading, except so far as connected with sermon-producing, must have been altogether impracticable. But our incumbent is no less a wonder in these respects than in the others. We are informed in a subsequent paragraph, that 'he partook of the hospitality of friends on 165 separate days;' and in this very sensible and necessary relaxation, we may probably find, even on physiological grounds, the secret of his extraordinary endurance. A man, requires his play as well as a boy. The overtaxed mind must be relieved as well as the wearied body; and in certain circumstances it is absolutely necessary to mental and bodily health that we should be drawn out of ourselves, and forced to relax our grasp upon anxious and depressing thoughts and cares, in a way which only cheerful society can effect. The body may indeed rest in the easy-chair or the comfortable bed, but the mind will not do so. This quiet and repose are only more favourable to the indulgence of the prevalent and absorbing idea of the time, and in cheerful, innocent society alone lies the remedy for overwork and anxiety.

If the reader imagines that we have got to the end of our incumbent's labours, with the (probably) 3000 to 4000 house-to-house visits mentioned above, and

all the other details which accompany them, he is greatly mistaken.

Within a year or two, a sum of over L.10,000 has been raised for schools and other parochial purposes, and all the heavy and complicated machinery connected with this branch of duty has been set agoing. This alone would have seemed enough for one man's work, taking men in general as our standard; but there is still more to be told of the labours of 1857.

'During the year,' again writes our author, 'I have been honorary secretary to four religious societies, and to a fifth whose operations terminate with the year. Of two of these, the duties were merely nominal, but in two others they required very great attention. I am chairman of one permanent committee, and treasurer of two; and during the year, I attended 221 meetings.' Now, keeping in mind the occupations already specified, I would direct attention to the diligence which could still find time for attending the meetings of these societies, and managing their affairs and finances. Many industrious men might have found even this last department of labour quite as much as they could manage; but taken in a cumulative sense, along with what had gone before, we feel quite astounded; and are disposed at length to say with uplifted hands and eyes: 'Ohe jam satis!'

No such thing! Full as the list may appear to unpractised eyes, there are in the capabilities of this man, some portions still unoccupied, a corner or two into which some small 'odds and ends' of employment may still be packed. Listen once more: 'The avoidance of meetings, especially in the evenings, has increased my time for intellectual pursuits. I have read about ninety volumes on various subjects, exclusive of pamphlets, reviews, &c. I have also written five magazine articles, three short papers for learned societies, twelve articles of a more fugitive character, on literature, science, and education; and an elaborate paper of instructions for my teachers on the subjects of school-organisation and discipline. I have made twenty-one speeches, and delivered nine public lectures, besides editing a pamphlet of about ninety pages in extent, and, with some assistance, an important volume of 800 pages. But the most tedious intellectual operation was the construction of two ethnological maps of a kind wholly new, and from materials which are common and accessible in every county in the kingdom. Each of them required a minute analysis of about 20,000 facts, yet any of the numerous details indicated may be tested in an instant.'

This paragraph shews that an active mind may be lodged in an active body, and that local and corporeal mobility of a very unusual kind may be associated with mental activity no less remarkable.

But, reader, we have yet more to tell; one more short extract will bring us to the end of this *tot, et tanta, negotia*.

You will say that, in whatever way we are to account for the performance within the year, and even within 288 days of it, of so much physical and intellectual labour, along with the 165 separate days on which the claims of social relaxation were attended to, this would, at the least, entail a necessity for a very snail-like power of staying at home. Again, I say, no such thing. You would further suppose that epistolary correspondence, which, in a small way, so many of us find it hard enough to get through from day to day, could find no place in these herculean labours. Listen, then, once more: 'My correspondence has extended to 1200 letters. I have visited Wales three times; Ireland, twice; the Isle of Man, once; and London and Oxford, once!'

Now, with all this, should you have supposed that there was any room for mechanical occupations within doors? Allow me one 'more last word,' and you shall

hear: 'I have occupied myself at intervals with mechanical duties, which may be described as amateur bookbinding.'

There, reader, is a man for you! I know of nothing to compare with him, either on sea or land, but one whom I had thought the 'inimitable' Dr Livingstone. It is true that this latter personage, with the true modesty of greatness, says that he is *but* a man. I can only reply, that to be a man after the fashion of the heroic doctor and our Lancashire incumbent, is to be one in no ordinary sense of the term. This paper may fall under the observation of more than one before whom a professional career, no matter of what sort, is just opening out, and whose success must depend mainly upon his courage, activity, integrity of heart and purpose, and self-reliance. Let such a one read over at his leisure, again and again, the details given above; let him observe how much may be done by determining that it *shall* be done, and by the force of an indomitable will; let him understand the value of time well laid out and carefully divided; and although he may very naturally despair of equalling the very extraordinary achievements of this striking exemplar, he will attain all the more for studying and aiming at a really high standard of excellence.

It must be allowed that a clergyman's life admits of a variation in employment which cannot be obtained in other professions. The example is, therefore, chiefly valuable to the clerical brethren of the incumbent, who can, like him, vary the *modus operandi* at pleasure, provided that within a certain time a required result be produced.

The principle, however, which may be educed from a consideration of this remarkable case is one of the utmost value, and of universal application. As such, I heartily commend it to the careful study and conscientious imitation of my younger readers, whose characters and professional habits may still be in a great measure unformed, and who may be on that account within reach of its salutary influence. If we cannot do all we *would*, let us determine to do all we *can*.

D'A B O R D D U M E R.

FROM A FRENCH SONG.

Along the shore, along the shore
I see the wavelets meeting,
But thee I see—ah, nevermore,
For all my wild heart's beating.
The little wavelets come and go;
The sea of life ebbs to and fro,
Advancing and retreating:
But from the shore, the steadfast shore,
The sea is parted never:
And mine I hold thee evermore
For ever and for ever.

Along the shore, along the shore
I hear the waves resounding,
But thou wilt cross them nevermore
For all my wild heart's bounding.
The moon comes out above the tide,
And quiets all the waters wide
Her pathway bright surrounding:
As on the shore, the dreary shore,
I walk with vain endeavour;
I have thy love's light evermore,
For ever and for ever.

PRICE 1½d.

AMATEUR POLITICIANS.

'Fish swim best that are bred in the sea,' says the proverb. The truth of this saying, modern usage every day exemplifies in some new manner. Every day the division of occupations existing the day before is supplemented by a more minute and marked subdivision; every day some new branch of science, or skill, or industry, is separated from the kindred department of which it has hitherto formed an indistinguishable portion, and is made the separate heritage of a special class. Every age creates some new craft, whose only function it is to relieve society of some task that was formerly the charge of all its members indiscriminately, until the progress of civilisation promises to reduce a highly organised community to a condition not unlike that of an Indian household. A European *paterfamilias* in Hindostan finds that the servant who airs his shirt will not brush his coat, and that the boy who blacks his shoes will not condescend to bring them to his door. The same, on a grand scale, is the industrial condition of a people in a high state of civilisation. The man who prescribes for your ailments will not compound the medicine that is to cure them; the lawyer who pleads your cause in court does not draw up your will, or even make out the brief on which he is to argue; the manufacture of each component part of your winter waistcoat—lining, buttons, cloth, &c.—forms a separate trade, involving some ten or twenty different varieties of occupation; nor is the labourer in any one of these diverse tasks able to make a coat for himself, much less for you. The same arrangements pervade the whole frame of society. One thing—nay, one of the smallest fractions into which one thing can be divided—is esteemed enough for one man to know and to do. His whole energies are spent in doing this fraction; his whole mind is devoted to apprehending this fraction; his whole duty is summed up in mastering the performance of this fraction; and wo betide him if he presume even by a hairbreadth to deviate from the strict limits of this fractional task. 'Let not the shoemaker go beyond his last,' is a maxim born of this caste-kind of civilisation; and expresses accurately enough the feelings of the man whose whole life is consumed on the performance of his fractional work towards all who would step from their own small circle to encroach on his—the feeling of professional men towards an *amateur*.

In former times, almost all men were amateurs in almost all occupations. The farmer was an amateur butcher; the farmer's wife and daughters were amateur labourers at the spinning-wheel and the loom. The

clergyman, whose professional duty was limited to the cure of souls, undertook *en amateur* the functions of physician to the bodies of his flock. Certainly things were not so well or so cheaply done in those days; linen was more expensive, and men's bodies did not always thrive under the care of their spiritual pastors. But to those who thus varied their occupations, the pleasure of variety might atone in no small degree for the difficulties and embarrassments which resulted from their lack of professional lore to aid their 'labours of love.' Society has gained much in establishing distinction of professions; but the amateurs have undoubtedly been sufferers by the change.

Of all professions, the political is perhaps the most recent growth of our highly civilised soil; and, accordingly, there is no profession whose outskirts are so closely beset by a crowd of amateurs. Of course these are treated with becoming professional scorn by those who have been regularly admitted into the mysteries of this exalted guild. But society at large has not yet pronounced itself on behalf of the professionals. Amateurs in law, in medicine, or in military matters, are not very much respected; and the ridicule cast upon them by those on whose special province they encroach is usually endorsed by the general public. The necessity of an apprenticeship is recognised in physic, in arms, in jurisprudence; but in the belief of many, politicians, as Byron says of critics, are all ready made. How far this idea is correct, an inquiry into the more remarkable classes of ready-made statesmen, and the peculiar characteristics of each, may perhaps enable us to form some opinion.

It would be a great injustice to class among amateur politicians all those who, without devoting themselves to political pursuits, take a warm interest in all the great questions of the day, and on occasion exert themselves strenuously on behalf of a valuable measure or a favourite statesman. The Athenian legislator of old is said to have made it a punishable offence in any citizen to abstain from politics altogether; and he probably judged wisely. Where a free government exists, there can be no other security against maladministration on the one hand, and anarchy on the other, than the existence of strong political convictions among the educated portion of the people. Where these are wanting, either corruption places arbitrary power in the hands of the statesman by profession, or agitation leaves the government at the mercy of the demagogue—the very worst species of political amateur. There is no scene more honourable to the British character than that of a well-contested election in one of the great constituencies, at once too numerous to admit of corruption or intimidation, and

too intelligent and educated to present such a spectacle of licence and disorder as too frequently disgraces the performance of a great national duty. The leading men of the district—gentlemen well known to the vast crowds there assembled for their wealth, their public spirit, and their high personal character—take active part on one side or another, and strain their powers to the utmost to insure the return of their candidate. The crowd which fills the streets, blockades the polling-booth, or ways to and fro in front of the hustings, is likewise in hearty downright earnest in its way; and every man present exerts his lungs, when the turn of his party comes to shout for the yellow or the blue, with as much vigour and resolution as if the fate of the nation depended upon that single yell. For a week or so, politics form the staple of conversation in every reading-room or tavern parlour; in the rich man's drawing-room, and in the poor man's kitchen. But are these amateur politicians? Not they; by the time the battle is well over, and the song of triumph sung by the local organ of the victorious party, they have all had their fill of political topics; and they return with additional zest to their daily labours, and the everyday routine of their lives, satisfied to leave the country in the hands of the member they have chosen, and the minister whom he supports, until the next occurrence which may necessitate a repetition of the popular excitement.

It is not in such scenes as these that the amateur politician most shines. There is in them too much good-will and good-humour, and withal too much general earnestness on all sides, and the atmosphere is not well suited to him. Moreover, he is not only swamped by the flood of men as well qualified as himself, and for the nonce as decided in their own opinion, but he runs no little risk of being summarily overborne and put down by collision with better informed and better disciplined minds. He shines more brightly by contrast, when the political horizon is devoid of any star of more than fourth-rate magnitude, and when he has the field to himself. He is then the bore of the club, or the oracle of the tap-room, and scintillates without fear of an eclipse. Few listen to him, and those who do are not men competent to refute him. He can enlighten a circle of admiring disciples on the fearful evils of diplomacy, and convert the Foreign Office into a very Castle of Otranto before their bewildered vision; and no one cares to dissolve the spell by one magical word of common sense. Or he can denounce to a sympathising audience the crimes of capital, and the cold-blooded cruelty of political economists; and no one will arise to expose him before the men whom he is so mischievously deluding. He is now in his glory, such as it is; and few care to disturb it.

Of all classes of political quacks, none is so noxious as the man who is great upon social questions. Here a subject is started which can hardly fail to interest any audience, especially of the working-classes: an audience is readily obtained, disposed to listen with favour to all arguments which shall shew that all the afflictions which too frequently beset their path in life, are the result of political oppression or social injustice, and may be remedied by some summary process, which the orator is generally wise enough to leave to the imagination. There is no subject of general interest on which a denser ignorance prevails, even among men who have had greater educational advantages, than obtains in regard to the truths of political economy. While the man who should endeavour to teach his hearers that the sun goes round the earth, or that the globe rests on the back of an elephant, would be forthwith laughed at by the most ignorant audience in any large town, numbers of men who ought to know better, will applaud the empiric who boldly denies or audaciously ignores the

first principles of economical science. The mischief which is thus wrought is very serious. Such doctrines tend to produce an impression among the working-class, that all their troubles are owing to the folly or wickedness of those above them. They are persuaded that all the embarrassments which are shewn by the economist to be the inevitable result of natural laws, have their origin in unjust or defective social arrangements; and they are thus seduced from the only means of bettering their condition—reliance on their own prudence and their own exertions—and led to seek relief in efforts which can by no possibility succeed, and whose success could only land them in a confusion worse confounded. If no other harm were done than the excitement of a discontented feeling, and an idea of wrong received from capitalists, or landowners, or statesmen, or any and every one better off than themselves, the evil would be sufficiently grave to affix a terrible responsibility on the delusive and ignorant teacher. A man who will talk on what he does not understand, may always hope to do mischief. An empiric of any kind is a public enemy; but none is more dangerous than these quack-doctors of the social body, who persist in talking without knowledge on a subject of keen interest and vital importance, and who do their utmost to prejudice the sufferers against the only men who have studied the science of social medicine, and can explain the real causes and remedies of social ills.

Less mischievous by far, yet not without his own especial capacity for doing harm, is the political amateur who has made the foreign relations of the kingdom his especial study. He is well read in blue-books, and appears to have the whole history, known and unknown, of every diplomatic transaction for the past thirty years at his finger-ends. His conversation on these topics, however, is strikingly illustrative of the poet's saying:

Knowledge and wisdom, far from being one,
Have oftentimes no connection.

For lack of the sense and judgment which are requisite to enable men to turn even the most accurate knowledge to account, talkers and writers of this school commit themselves to theories so grossly absurd, and to statements so ludicrously impossible, that they never obtain credit among sensible men, even for the amount of information they really possess. No supposition is too improbable for their adoption; no folly too preposterous to find credit and acceptance among them. Were their minds somewhat better endowed with that invaluable faculty of critical intuition which is denominated 'common sense,' they might acquire wide influence, and a numerous following. The subject of their study is one peculiarly interesting to all who take any interest whatever in political affairs as such; and the events of the last ten years have rendered continental politics much more familiar to the public of these islands than was formerly the case. But no amount of reading, no stock of quotations from blue-books, however ample, will persuade the cautious Scot or the downright Englishman of the truth of statements so utterly repugnant to common sense, so wildly disregarding of probability, as those put forth by the most notorious leaders of this school. The effect of their speculations and declamation has been to bring the study of foreign politics into contempt among the middle and lower classes, and to induce a neglect of matters which, from their bearing upon the national honour and the national interest, are deserving of careful attention from all who have sufficient leisure to study, and sufficient education to appreciate them. The ultimate effect of quackery, in any branch of knowledge, is and must be to discourage the study of the subject among the general public, and to tighten the grasp of professional men upon the

reins of power; their authority being always enhanced, even to an undue degree, by the humiliating failure of their pretentious rivals.

There are probably as many distinct classes and schools of political empiricism as of scientific quackery, each with its specific panacea for all national misfortunes or social grievances. On the one hand is a 'financial reformer,' who prophesies the speedy cure of all evils by the issue of an unlimited amount of inconvertible paper. On the other part, a statesman of the same stamp, but of opinions exactly opposite, advocates a return to a merely metallic circulation as the only basis of commercial prosperity. Here is a philanthropist, loud in his denunciations of all who venture to question the soundness of his views, demanding from government measures which are to relieve some peculiarly distressed class of operatives, whose distress is probably owing to the fact, that thirty thousand workmen have embarked in a trade which can furnish work only for twenty thousand. It is needless to multiply examples. There are certain principal features common to all these empirics, by which they may be detected; certain qualities belonging to the whole genus, which indicate clearly enough the value to be attached to their opinions. Of these, the most marked and most universal is their extraordinary confidence. A sound and experienced statesman is generally one of the most cautious of men. Knowing well how numerous are the conditions which have to be fulfilled in every possible measure for the relief of any suffering, or the redress of any grievance—how various and how complicated the circumstances which have to be taken into account, in seeking a satisfactory solution of any political question—he advances his views only after careful inquiry, and speaks always with guarded accuracy and studied moderation of the probable effects of his every proposition. The empiric has none of this caution. He has neither the experience which shows that practical difficulties often exist where, to the eye of theory, all is smooth and clear, nor the clearness of vision which can perceive the remote consequences which wisdom would foresee even where experience is defective. This confidence is principally the result of the ignorance which is another distinguishing mark of empiricism. Even the study of blue-books does not always render a man well acquainted with the political history of his own time. Blue-books and newspapers never reveal more than the surface of affairs. The causes of each event therein recorded; the motives with which each dispatch has been written; the difficulties with which statesmen have had to contend in the cabinet or in the closet; the differences which have led to the abandonment of an announced intention, or the emasculation of an important measure—all, in fact, that has passed *behind the scenes*—is, and remains for years, unknown to the public. Statesmen have to submit for years, perhaps for life, to suffer bitter taunts and wide-spread unpopularity for errors which, if the whole story of the case were known, it would be seen that they could by no possibility have avoided. They know the tools they have to work with, and the sunken rocks of which they must keep clear: those who criticise from without, judge men and events as if the machinery were perfect, and the course as clear as it seems to be. The amateur sees only the surface, and often only a fraction of that; and there is therefore reason to suspect, in every instance, that he is ignorant precisely of the most important part of the case upon which he undertakes to advise. His ignorance produces impatience. Where he is conscious of it, he is angry with all who endeavour, by the light of a clearer knowledge, to disprove his favourite crotchets. Where he honestly believes himself to have thoroughly mastered his subject, he is wroth with the slowness of those who refuse to adopt advice which seems to him so obviously and incontrovertibly correct. Besides

the impatience which he has learned from empiricism, there is not unfrequently the impatience that has made him an empiric. He was too eager and too irritable to work his way slowly to sound knowledge; so he preferred the shorter path of hasty assumption and unfounded theory. In no respect is this impatience more universally shewn than in the disregard which writers and talkers of this class ostentatiously profess for the teachings of political economy. To attempt any social reform, while in ignorance of the rudiments of this science, is not less absurd than for one wholly unacquainted with mechanical science to undertake to improve the machinery of some large factory. Yet, of professed social reformers, how few have the veriest smattering of a knowledge without which all their efforts are but too likely to prove not only vain, but even mischievous!

To those who are desirous to render themselves really competent to understand political affairs, and to form their own opinions on topics of national interest, a certain preparatory discipline, as in all other branches of human knowledge, is absolutely necessary. Without a knowledge of political economy—which is the science of social organisation—a sound judgment on social or political topics cannot be formed; and without a careful study of history, the materials by which alone a competent acquaintance with the nature and the principles of government can be obtained, are wanting. But the man who has mastered these two most valuable and most interesting subjects of inquiry, needs only a clear head and cool judgment to render him competent to form an opinion upon all political affairs sufficiently correct to render him a useful citizen and an intelligent political critic. To become more than this—to be capable of high statesmanship, or to master the details of political knowledge in all its branches, would require a special study, for which few but professional politicians have time or inclination. But this much at least is within the reach of every sensible and educated man; and without a self-training of this kind, no man can be morally justified in undertaking the duties of a political teacher, even in the humblest sphere. Were such a discipline common among those classes who take an interest in politics, their political influence would be far greater and far more beneficial than at present; while the general diffusion of this elementary political training would render the task of the agitator well-nigh hopeless, and reduce the empirical politicians, above described, to their native and natural insignificance.

MUDBURY BOTTOM.

Mr friend, Mr Robert Jones, from the metropolis, at present on a visit to me in Blankshire, was exceedingly desirous of seeing a coursing meeting, so I took him with pleasure to that of Mudbury. We are not above four miles from Mudbury over the Downs, and Jones at first declared that he would much rather walk than ride.

'I am not much used to riding,' he confessed frankly, 'and I saw your gray standing upon his fore-legs—I mean his *two* fore-legs—in the straw-yard this morning, from my window as I was shaving.'

'Well, Bob, you shall have the bay, then,' said I laughing.

'The bay was himself upon his two hind-legs,' returned my guest; 'and I would as soon think of riding a rocking-horse as either of these animals.'

However, when I shewed Robert my steady old four-wheeler, *Seaman*, who is as little disposed for gambolling, and not much less in bulk than a rhinoceros, he thought he might venture out upon that in safety, and thereon accordingly he rode.

Our Downs delighted him hugely, as indeed they delight all strangers with their lone green undulations

gemmed with greener fir-groves and patches of furze. How blithely over its hill-tops blew the south wind, causing us to bend over the necks of our galloping steeds as though we were placing lance in rest! How cheerily the springy turf returned the music of the beat of our horses' hoofs! How warm and sheltered were we in the little valleys, and down the last part of the descent, and across the bottom, and up the opposite hill, until we met the breeze again! How pleasant it was to race together, and to divide the stakes of health and appetite!

'Now, this is what I call real enjoyment,' cried my friend, with the blood mantling up into his metropolitan cheeks after one of these trials of speed; 'all the pleasures of horsemanship without any of the frightful risks. I protest I would as soon ride in a circus and jump through paper hoops, as go in and out of sheep-folds and over five-barred gates, as folks who hunt are accustomed to do. This is what I like: capital galloping ground without any fences to bother a fellow. I say, what's that great ditch we are coming to? How are we to get over it?'

'That ditch, as you call it, my dear Jones,' said I, 'was dug by the Romans, for about thirty miles or so, to mark their road, or ridgeway, across the Downs; and see! my gray has taken it in a fly, and thinks nothing of it at all.'

'Ah!' cried Jones, pulling up very short upon the other side, and craning over the little gulf; 'I think I will ride round, if you please, whatever may be the distance. I should not mind taking it perhaps, as you say, in a fly or a Hansom cab, but being upon horseback, why I'd rather not.'

Upon my solemn assurance, however, that Seaman would deliberately walk in and out of it, and not jump at it at all, my friend attempted the passage, and accomplished it with the utmost safety, and, better pleased with his elephantine animal, cantered on by my side again towards Mudbury.

Presently we reached the northern extremity of the Downs, the summit of that last green range of hills which looks down upon the varied beauties of three counties: hamlets clustered around their gray-towered churches; clumps of fir-trees upon hill-tops, that were beacons once by night as they are landmarks still by day; innumerable homesteads, with compact farm-yards and forests of ricks about them; the dull blue river, seen through the leafless trees along all its winding course among the low meadow-lands and under the high chalk-cliffs, until it hides itself beneath the bridge by the ancient town; here and there, far off, the smoke of a railway-train, but not the train itself; nothing in motion, for the many-horsed wagons upon the open roads, and the long lines of plough-teams in the fields do not seem to stir, nor do the flocks upon the right and left, although the thin clear notes of their sheep-bells tell us otherwise. Beneath us in the cold December sunshine, lies the little village, where holiday is made this day by reason of 'the coorasing,' and between us and it in Mudbury Bottom is the meet itself, than which who ever saw a prettier sight?

Upon the left hand is a knot of various carriages, from the dashing four-in-hand down to the covered cart, ordinarily the medium of communication between the hamlet and its market-town, but to-day transformed into a peripatetic public-house; a great array of heterogeneous machines only to be specified as 'four-wheels'; a very plague of gigs, as many in multitude as the flies of Egypt, and of every colour in the rainbow, with a predominance of yellow; several of those particularly unconversational machines called 'sociables'; and many dog-carts, literally dog-carts, which have conveyed hither the beautiful candidates for the prizes from their distant kennels or from railway stations: all these are on a hillcock commanding

a good view of the scene of action, with a great crowd of pedestrians round them, and a few score of horsemen.

A half mile to the right is the main body of some two hundred mounted gentlemen and farmers, and beyond these a sort of vanguard, composed of a few dozen more. These last are slowly marching in line along a turnip-field, the voluntary beaters for game.

'Why, those are fox-hunters!' cried Jones despairingly. 'I see a whipper-in, in a red coat!'

'Yes, my friend; but that is only the judge of the courses; and just before the party in the turnips you may observe another red coat upon foot—that is the slipper. He holds the couple that are to run next in his leathern leash, within which is a string whereby he can let slip the animals at any moment. See, now they've found their hare! There she goes down the hill, straight for the fir-plantation just beneath us. Now the dogs have the sight! See how they strain and drag the slipper with them out into the open! "Go;" and as the judge gives the mandate, the skilful footman slips them with a forward motion, simultaneously; and the greyhounds, fawn and white, the very types of speed, at once the swiftest and the most graceful of all animals, are taking three yards of ground for poor pussy's two. We all know that famous question in the arithmetical school-book, and could at one time have calculated to a nicety the very moment when her pursuers will come up to her, but as to when they will catch her—look, how she threw them out by that sharp turn—that is a very different matter. Down-hill, indeed, the little creature has no chance; the dogs recover their lost ground, gain on her, overtake her, arch their long backs in readiness to spring, and—now they are thirty yards behind her at least, and have not turned themselves yet, while the wily hare is making up the hill towards her haven of safety, with her ears invisible, so straight does she lay them on her back, and her heart, if we could but hear it, beating loud indeed, but not without good hope of many dewy mornings yet to come, wherein she will make breakfast in these fields, and snooze in her snug form through winter noons. But the dogs, too, seem to be aware that now or never must they catch their victim while she is still a field's breadth from the cover; again they come up with her, turn her, force her to take down-hill away from home; and the fawn dog, which leads by half a head, with outstretched neck makes one fierce grab at her, and in his angry jaws behold a mouthful of pussy's fur. But puss herself, having just at that instant doubled, is again far in advance, away up the hill once more, and reaches cover safely.'

'Well done!' cried Jones. 'I'm glad she got away.' And so was I, and so was everybody; for it is not the killing of the hare, but the coursing of it, we are come to see at Mudbury Bottom. Many a good course is run without a death; many a dog which kills is the worse dog of the two; for the race here is to the swift, and the battle to the strong; the winner being he which follows best the very footsteps of the hare, turns her by main speed, and sticks by her to the last, and not his more cunning rival, which takes advantage of what the other does for him, and cuts off corners, and so kills. The judge, conspicuous in his scarlet, has galloped with them throughout the course; but not the rest of the spectators, because the ground just coursed over is as yet untried, and contains probably many hares. More than one, indeed, has been put up already, and has scuttled off with ears back and tail erect, delighted enough to find herself unpursued. 'Fawn,' cries the red horseman; and instantly another horseman (the flag-steward) holds up on high a red flag for a minute or two, and those who have backed the white dog are sorry to see it. The judge gallops back; the cavalry in the turnips advance

again; another brace of dogs, a white and a black one, are in the slipper's hand, and presently up starts another hare. This is a smaller and a weaker animal, for the pursuers, in spite of a good deal of 'law' accorded to her, are upon her in an instant, with not an inch, as it seems, between their teeth and her scut.

'Why, she bit him,' cried Jones enthusiastically; and so, indeed, it seemed from where we stood, for puss twisted round so suddenly under the very jaws of the white dog that he leapt over her and turned a complete somersault, as if alarmed for his life. The black is after her, however, and turns her of himself; and when rejoined by his rival, they have to practise circular progression for full five minutes, the hare turning of course as upon a pivot, and the dogs recovering themselves after a considerable interval as best they can. By this corkscrew sort of movement, however, poor puss can progress but slowly towards her firgrove, and in one of her turns—not good enough, I suppose, to deserve another—she is 'caught' as it were in the air by the black dog, and a dreadful cry breaks forth, as though from a tortured child. 'Why, they have hoisted a white flag,' cried Jones; 'what an unjust judge! The black one made every turn but two, and caught the hare. How much does the fellow get, I wonder, for deciding so?'

'Hush, Bob; hush,' said I: 'the flag you see does not represent the hue of the dog, but its place either on the right or left side of the card, which in this case is the left or white; and by the card of the courses, one of which we will buy presently, you will be able to know which in each course is declared the winner. Let us descend and see the sport from a nearer point.'

It is not pleasant riding, this descent of a steep Down in wet December; and Jones's face, as his horse slipped forward without moving a leg, was a study for a comic artist. He lay so far back upon the elephantine Seaman, for fear of coming over his head, that his foreshortened appearance represented to the astonished beholder nothing save his toes and his nose. By the time he reached the bottom, there had been another course, and puss had again reached the plantation in safety, round and about which, 'though lost to sight, to memory dear,' her baffled pursuers were still vainly straining their keen eyes, and pointing their scentless noses. Upon the hillock, we found all the dogs that had not yet run, clothed, as though they had been Italian greyhounds, in fashionable garments, and with only their legs and heads exposed to the air, like so many miniature race-horses; also a great company of Mr John Leech's little boys, enjoying their Christmas holidays upon the backs of infinitesimal ponies, all mane and tail. Some of these young gentlemen were prudently keeping their steeds fresh for the Downs' coursing, to take place presently, where the hares would run stronger and longer; but the majority rode every course they could, in spite of the cries of the judge that they should keep where they were; and after the kill, they generally raced back again to the hillock besides; while between these runs, and even during them, as it seemed to Jones and myself, they never ceased to devour gingerbread-nuts and apples. Among these were also some half-dozen of gentlewomen mounted, with feathered hats, and habits that almost touched the ground, the most becoming attire in which the daughters of England can be seen.

At a little distance, upon beautiful thoroughbreds with arching necks and champing mouths, upon glossy hunters, and upon stout sturdy cobs, rode the two hundred gentlemen and farmers, the ruined agriculturists of Southern Blankshire, smoking their Havannahe and betting their crowns, a mounted troop such as no other European country could furnish; with here and there a grotesque exception, such as some unparalleled case of obesity upon a Shetland nag, or

a more independent than wealthy sportsman perched upon the tottering hind-legs of a Jerusalem pony. Here, too, rode the stewards of the meeting, with red and white ribbons at their button-holes, and with choice expressions in their mouths for folks who would ride over the untried ground and start poor puss when there were no dogs to follow her. Curious it is to mark the nicety of gradation of the treatment which these sort of trespassers experience; how the transgressing squire is expostulated with, and the erring yeoman sworn at, and the sinful smock-frocked pedestrian fairly horsewhipped back into his proper place. This kind of crime, indeed, is fatal to a coursing-meeting, whatever may be the original number of hares. Nowhere are there more to be found than in Mudbury Bottom—thirty in that single turnip-field, twenty out of that ploughed land yonder, and half a hundred at the least which have taken shelter in the plantation already—but this disturbing them before their time has ruined our sport: every part of the Bottom has now been ridden or run over, and the next time puss gets up we have permission to follow her anywhere.

'Soho!' cries a sharp-eyed burly farmer. 'There she lies, Jones, under the gray grass yonder, where you and Seaman almost slipped upon her just now.' How close she sits, for she well knows what we are come about, and will not stir a leg until she is whipped up. Fatal mistake, puss, surely, while thy canine enemies are yet scores of yards away, and the slipper does not even know of thine existence! The horsemen have ridden off to left and right of her by this time, and made a lane along which she must needs run towards the Downs. Hold hard, stout gentleman upon the Shetland, and get into the rear, lest you be ridden over! Push forward into the front rank, boys upon infinitesimal ponies, for you will need all the start you can get. Up comes the red judge upon a fresh horse, and the red slipper (poor fellow) upon the same pair of feet; but somebody will presently lend him a horse to mount the hill. There is a smack of a hunting-whip, and off starts a large long-legged hare, straight for the downland; away go the winged dogs; away the regiment of miscellaneous cavalry, some three hundred strong; and away the pedestrians, for there is no chance of seeing anything more in Mudbury Bottom; and away the four-in-hand, and the gigs, and the sociables, and the peripatetic public-house. There is no road for these of any kind, but they work up the least perpendicular field, which happens to be ploughed land, as though they were so many teams. As for the Down, that is altogether too steep for wheels; and the horsemen themselves seem to be hanging on it like flies upon a window-pane; the foreshortened appearance of Mr Robert Jones being now reversed, and presenting to the beholder only a pair of coat-tails upon horseback, and a pair of heels. I pass him upon my speedier nag, but he sees me not, for his head is bent downward, and his arms are clasped around Seaman's neck, as though that animal were the most beloved of female friends. The stout hare has held her own over the hill; and when I reach the summit, the three are a mile away, with pussy well in advance, for her feet are upon the springy grass, which is her 'native heath' in Blankshire. One moment to breathe the gray, and to mark once again the beautiful vale-landscape behind us, with its foreground covered with the many-hued straggling multitude, and then over the tiny wattle-hedge—which, however, will puzzle Mr Robert Jones a little—on to the long flat gallop of the ridgeway. 'Well done, youngster on the chestnut! Bravo! little one off the crop-eared Welsh pony, picking yourself up again, and riding away with one foot in the stirrup: that's the Balaklava-charge order of young gentlemen! Bless me, if the white donkey is not over that place which

the thoroughbred refused! Beautifully cleared, young ladies upon the bay and brown; wonderful is it that you can sit a jump at all with those one-sided seats of yours! Come along, old Seaman, through the gap which the blundering butcher-boy has made. Give him the spur, Jones, or we shall see nothing of this; and let us get out of the flying turf, and shew these folks the symmetry of our heels!

Luckily, the hare turns towards us, and we are able to mark the latter part of the run to perfection. Neck and neck run the dogs; or if a black head does forge momentarily in advance, a white one leads for the next instant. The hare never doubles again; but, as if disdaining to use any devices save those of strength and speed, makes straight for the furze yonder. So swiftly, so arrow-like do they clear the ridgeway, which is here about forty feet broad, that they seem to have flown from side to side without alighting; across the turnips toil the very swiftest after them in vain; and as to the sheepfold—where the red judge pulls up very short—they seem to have made but one spring in and out of it.

Both cavalry and infantry are stationed between her and her haven; but whatever they may do to her, poor pass well knows that there is certain death behind; between foot and hoof rushes the fear-winged creature, and under the scanty hedge into the thick covert, only just in time. The white and black dogs are side by side within her own length of her; and there is another cheer beside that which proclaims her escape when the judge waves his hat to signify that the course is undecided. A good two miles and a half from Mudbury Bottom has she led those noble animals at fastest speed, and now both flags are waving to shew that there has not been a pin to choose between the black dog and the white.

No less than sixty courses were there run that December day for various stakes; and many were the silver cups and sauce-boats, and silver dog-collars, bestowed as guerdons upon the fortunate owners. Not one of them, however, was better pleased with the sport than was Mr Robert Jones of London, who declares that nothing would delight him more—after a day or two, that is, for he has not been used to riding—than to mount again the prudent Seaman, and see another coursing-meeting in Mudbury Bottom.

AN OCEAN OF MONEY.

THE poets have so long accustomed us to speak of the *silvery* sea and the *silver*-crested wave, that such expressions are commonly employed by modern writers of elegance as necessary civilities to which Old Ocean is entitled. It may be, however, that although many have gazed with admiration on the moon-beams gliding over the rippling surface of the sea, or have watched with interest the wild waves dash into whitened spray on the rocky shore, few are aware that when we speak of the silvery waters, we do not merely use a pleasing and complimentary figure of speech, but we state likewise a scientific fact. Recent investigations shew this to be the case; for the waters of the sea hold silver in solution.

That the waters of the ocean contain a notable quantity of silver was first shewn by three continental chemists,* who were led to the investigation by theoretical considerations. A considerable quantity of sea-water was taken from off the coast of St Malo a few leagues from land, and formed the *matériel* for an extensive series of experiments, the results of which were as follows: Fifty litres of the sea-water yielded a demi-milligramme of silver; so that in round numbers 100 kilogrammes of water contain 1 milligramme of

silver. The proportion of silver in sea-water is approximately 1 part in 100,000,000; a cubic mile (English) of sea-water contains, therefore, about 2½ pounds avoirdupois of silver. This estimate may be regarded as a minimum, the experiments being necessarily attended with some loss.

The total quantity of silver contained in the waters of the ocean is estimated (from known data) at two million tons.

The question naturally arises—Whence came all this silver? Has it been carried into the ocean by rivers in recent times, and derived from the waste of that which is used by man? or is its existence therein of more ancient date? That the former supposition is not the case, will appear when we reflect that the amount stated (2,000,000 tons) is probably greater than that which has even been extracted from the earth by artificial means. The chemists also arrived at the same result from special investigation; they examined rock-salt occurring in sedimentary strata, and deposited from ancient salt-lakes or marine basins; and here the existence of silver was demonstrated. We might object that the silver might have been introduced into the salt from neighbouring rocks; but it appears probable, irrespective of the fact stated, that the presence of the metal in sea-water is of ancient date.

Silver also occurs in coal. The existence of silver has likewise been shewn in various chemical products; in the preparation of which sea-salt is employed; for example, in carbonate of soda and hydrochloric acid. But one of the most interesting results obtained is, that silver forms a not unimportant constituent of animals, and especially of plants. The blood of the ox yielded silver—derived no doubt from the plants on which it feeds. The metal was found appreciably abundant in the ashes of the wood of various trees, such as the oak, birch, beech, hornbeam, aspen, apple, and ash—all grown at considerable distances from the sea; so that the presence of silver in the organic kingdom appears to result from its very general distribution in the mineral kingdom; and is therefore not limited to certain special conditions.

Sea-weeds contain a very large proportion of silver, much larger than the sea-water itself. Some of the more common kinds were experimented upon, such as the large fuci, or brown weeds, so abundant around all our coasts, within tide-mark; and the ashes of all yielded buttons of silver by cupellation. *Fucus serratus*, which is so abundant on the Portobello sands, yielded silver in the proportion of a thousandth part of the total weight of ashes. *F. ceranoides*, also a common species in Britain, gave an equal proportion of the precious metal. From these calculations, it would seem that the fuci are about twenty-six times as rich in silver as sea-water itself. Of course, the silver contained in sea-weeds has been derived by them from the water in which they grew; for they have no proper roots, and therefore no great power, like land-plants, of absorbing food from the rocks and soil to which they are attached.

Although the gross quantity of silver in the sea is enormous, yet the proportion which the metal bears to the water is so small in amount, that we cannot reasonably hope that the extraction of silver from sea-water will ever become a profitable operation; it is indeed scarcely probable that even the sea-weeds, which contain a more notable proportion, will ever be made available as a source of this metal, although recent improvements in the purifying of lead shew how a very minute quantity of silver in admixture with lead may be made to pay profitably for its extraction. But one discovery leads to another, and the present one has led to at least one practical result; which is brought out in a paper by Mr

* Malaguti, Durocher, and Sarzeaud. See *Ann. Chem. Phys.* (3), xxviii. 189; also, *London Chemical Society's Journal*, iii. 68.

Frederick Field, lately read by Professor Faraday to the Royal Society of London.

Mr Field observes: 'As a solution of chloride of silver in chloride of sodium is instantly decomposed by metallic copper, chloride of copper being formed, and silver precipitated, it appeared to me highly probable that the copper and the "yellow metal" used in sheathing the hulls of vessels, must, after long exposure to sea-water, contain more silver than they did before having been exposed to its action, by decomposing chloride of silver in their passage through the sea, and depositing the metal on their surfaces. A large vessel, the *Asa Guimaraens*, now under the Chilean flag, was hauled down in the Bay of Herradura, near Coquimbo, for the purpose of being repaired, and the captain obligingly furnished me with a few ounces of the yellow metal from the bottom of the vessel. The investigation was interesting, as the metal had been on for more than seven years—an unusually long period—and the ship had been trading up and down the Pacific all that time. The metal, upon examination, was found to be exceedingly brittle, and could be broken between the fingers with great ease.' 5000 grains having been dissolved and analysed, yielded 2.01 grains silver, or at the rate of 1 pound 1 ounce 2 pennyweights 15 grains troy per ton. 'This very large quantity could hardly be supposed to have existed in the original metal, as the value of the silver would be well worth the extraction.' Fresh yellow metal, with which the vessel was being repaired, yielded only 18 pennyweights to the ton. Specimens of Muntz's yellow metal from the cabin—where it was not exposed to the sea—yielded 19 pennyweights 14 grains to the ton, while specimens of the same which had been on the hull for three years gave 7 ounces 18 pennyweights 1 grain per ton, that which had been exposed to the sea having nearly eight times as much silver as the original sample.

The amount of silver in the specimens of the recent metal, being considerable, probably arises from the circumstances that, in many cases, new sheathing is made by melting down the old copper and re-rolling, so that the sheets may have derived their silver from the sea on a former occasion. The copper commonly used in the manufacture of yellow metal is very pure, containing 2 or 3 pennyweights of silver per ton, frequently not so much, and silver is very seldom associated with the other constituent, zinc.

In order to arrive at more certain experimental results, Mr Field has granulated some very pure copper, reserving some in a glass-stoppered bottle, and suspending the remainder in a wooden box, perforated on all sides, a few feet under the surface of the Pacific Ocean. When occasion offers, the box is towed by a line at the stern of a vessel, which is trading up and down the coast of Chili.

OCEOLA:

A ROMANCE.

CHAPTER XXVIII.—THE RISING SUN.

Yes, it was Oçeola, 'the Rising Sun'—he whose fame had already reached to the furthest corner of the land—whose name had excited such an interest among the cadets at college—outside the college—in the streets—in the fashionable drawing-room—everywhere: he it was who had thus unexpectedly shewn himself in the circle of chiefs.

A word about this extraordinary young man.

Suddenly emerging from the condition of a common warrior—a sub-chief, with scarcely any following—he had gained at once, and as if by magic, the

confidence of the nation. He was at this moment the hope of the patriot party—the spirit that was animating them to resistance, and every day saw his influence increasing. Scarcely more appropriate could have been his native appellation.

One might have fancied him less indebted to accident than design for the name, had it not been that which he had always borne among his own people. There was a sort of prophetic or typical adaptation in it, for at this time he was in reality the rising sun of the Seminoles. He was so regarded by them.

I noticed that his arrival produced a marked effect upon the warriors. He may have been present upon the ground all the day, but up to that moment he had not shewn himself in the front circle of the chiefs. The timid and wavering became reassured by his appearance, and the traitorous chiefs evidently cowered under his glance. I noticed that the Omatlas, and even the fierce Lusta Hajo regarded him with uneasy looks.

There were others besides the red men who were affected by his sudden advent. From the position in which I stood, I had a view of the commissioner's face; I noticed that his countenance suddenly paled, and there passed over it a marked expression of chagrin. It was clear that with him the 'Rising Sun' was anything but welcome. His hurried words to Clinch reached my ears—for I stood close to the general, and could not help overhearing them.

'How unfortunate!' he muttered in a tone of vexation. 'But for him, we should have succeeded. I was in hopes of nailing them before he should arrive. I had told him a wrong hour, but it seems to no purpose. Deuce take the fellow! he will undo all. See! he is earwigging Onopa, and the old fool listens to him like a child. Bah!—he will obey him like a great baby, as he is. It's all up, general; we must come to blows.'

On hearing this half-whispered harangue, I turned my eyes once more upon him who was the subject of it, and regarded him more attentively. He was still standing behind the king, but in a stooping attitude, and whispering in the ear of the latter—scarcely whispering, but speaking audibly in their native language. Only the interpreters could have understood what he was saying, and they were too distant to make it out. His earnest tone, however—his firm, yet somewhat excited manner—the defiant flash of his eye as he glanced towards the commissioner, all told that he himself had no intention to yield; and that he was counselling his superior to like bold opposition and resistance.

For some moments there was silence, broken only by the whisperings of the commissioner on one side, and the muttered words passing between Oçeola and themico on the other. After a while, even these sounds were hushed, and a breathless stillness succeeded.

It was a moment of intense expectation, and one of peculiar interest. On the words which Onopa was about to utter, hung events of high import—important to almost every one upon the ground. Peace or war, and therefore life or death, was suspended over the heads of all present. Even the soldiers in the lines were observed with outstretched necks in the attitude of listening; and upon the other side, the Indian boys, and the women with babes in their arms, clustered behind the circle of warriors, their anxious looks betraying the deep interest they felt in the issue.

The commissioner grew impatient; his face reddened again. I saw that he was excited and angry—at the same time he was doing his utmost to appear calm. As yet he had taken no notice of the presence of Oçeola, but was making pretence to ignore it, although it was evident that Oçeola was at that moment the main subject of his thoughts. He only looked at the young chief by side-glances, now and again turning to resume his conversation with the general.

* Oçeola—written Oçeola, Anceola, Assula, Haseola, and in a dozen other forms of orthography—in the Seminole language, signifies the Rising Sun.

This by-play was of short duration. Thompson could endure the suspense no longer.

'Tell Onopa,' said he to the interpreter, 'that the council awaits his answer.'

The interpreter did as commanded.

'I have but one answer to make,' replied the taciturn king, without deigning to rise from his seat; 'I am content with my present home; I am not going to leave it.'

A burst of applause from the patriots followed this declaration. Perhaps these were the most popular words that old Onopa had ever uttered. From that moment he was possessed of real kingly power, and might command in his nation.

I looked round the circle of the chiefs. A smile lit up the gentlemanly features of Holata Mico; the grim face of Hoitle-mattee gleamed with joy; the 'Alligator,' 'Cloud,' and Arpiucki exhibited more frantic signs of their delight; and even the thick lips of Abram were drawn flat over his gums, displaying his double tier of ivories in a grin of triumphant satisfaction.

On the other hand, the Omatlas and their party wore black looks. Their gloomy glances betokened their discontent; and from their gestures and attitudes, it was evident that one and all of them were suffering under serious apprehension.

They had cause. They were no longer suspected, no longer traitors only attainted; their treason was now patent—it had been declared.

It was fortunate for them that Fort King was so near—well that they stood in the presence of that embattled line. They might need its bayonets to protect them.

The commissioner had by this time lost command of his temper. Even official dignity gave way, and he now descended to angry exclamations, threats, and bitter invective.

In the last, he was personal, calling the chiefs by name, and charging them with faithlessness and falsehood. He accused Onopa of having already signed the treaty of the Oclawaha; and when the latter denied having done so, the commissioner told him he *lied*.* Even the savage did not reciprocate the vulgar accusation, but treated it with silent disdain.

After spending a portion of his spleen upon various chiefs of the council, he turned towards the front, and in a loud angry tone cried out:

'It is you who have done this—you, Powell!'

I started at the word. I looked to see who was addressed—who it was that bore that well-known name.

The commissioner guided my glance both by look and gesture. He was standing with arm outstretched, and finger pointed in menace. His eye was bent upon the young war-chief—upon Oqeola!

All at once a light broke upon me. Already strange memories had been playing with my fancy; I thought that through the vermilion paint I saw features I had seen before.

Now I recognised them. In the young Indian hero, I beheld the friend of my boyhood—the preserver of my life—the brother of Maimee!

CHAPTER XXIX.

THE ULTIMATUM.

Yes—Powell and Oqeola were one; the boy, as I had predicted, now developed into the splendid man—a hero.

Under the impulsive influence of former friendship and present admiration, I could have rushed forward and flung my arms around him; but it was neither the time nor place for the display of such childish

enthusiasm. Etiquette—duty forbade it; I kept my ground, and as well as I could the composure of my countenance, though I was unable to withdraw my eyes from what had now become doubly an object of admiration.

There was little time for reflection. The pause created by the rude speech of the commissioner had passed; the silence was again broken—this time by Oqeola himself.

The young chief, perceiving that it was he who had been singled out, stepped forth a pace or two, and stood confronting the commissioner, his eye fixed upon him, in a glance, mild, yet firm and searching.

'Are you addressing me?' he inquired in a tone that evinced not the slightest anger or excitement.

'Who else than you?' replied the commissioner abruptly. 'I called you by name—Powell.'

'My name is *not* Powell.'

'Not Powell?'

'No!' answered the Indian, raising his voice to its loudest pitch, and looking with proud defiance at the commissioner. 'You may call me Powell, if you please, *you General Wiley Thompson*'—slowly, and with a sarcastic sneer, he pronounced the full titles of the agent: 'but know, sir, that I scorn the white man's baptism. I am an Indian; I am the child of my mother: * my name is Oqeola.'

The commissioner struggled to control his passion. The sneer at his plebeian cognomen stung him to the quick, for Powell understood enough of English nomenclature to know that 'Thompson' was not an aristocratic appellation; and the sarcasm cut keenly.

He was angry enough to have ordered the instant execution of Oqeola, had it been in his power; but it was not. Three hundred warriors trod the ground, each grasping his ready rifle, quite a match for the troops at the post; besides the commissioner knew that such rash indulgence of spleen might not be relished by his government. Even the Ringolds—his dear friends and ready advisers—with all the wickel interest they might have in the downfall of the Rising Sun, were wiser than to counsel a proceeding like that.

Instead of replying, therefore, to the taunt of the young chief, the commissioner addressed himself once more to the council.

'I want no more talking,' said he with the air of a man speaking to inferiors: 'we have had enough already. Your talk has been that of children, of men without wisdom or faith; I will no longer listen to it.'

'Hear, then, what your Great Father says, and what he has sent me to say to you. He has told me to place before you this paper.' The speaker produced a folded parchment, opening it as he proceeded: 'It is the treaty of the Oclawaha. Most of you have already signed it. I ask you now to step forward, and confirm your signatures.'

'I have not signed it,' said Onopa, urged to the declaration by Oqeola, who stood behind him. 'I shall not sign it now. Others may act as they please; I shall not go from my home. I shall not leave Florida.'

'Nor I,' added Hoitle-mattee in a determined tone. 'I have fifty kegs of powder: so long as a grain of it remains unburned, I shall not be parted from my native land.'

'His sentiments are mine,' added Holata.

'And mine!' exclaimed Arpiucki.

'And mine!' echoed Poshalla (the dwarf), Coa Hajo, Cloud, and the negro Abram.

The patriots alone spoke; the traitors said not a word. The signing was a test too severe for them. They had all signed it before at the Oclawaha; but now in the presence of the nation they dared not

* Again historically true—the very word used!

* The child follows the fortunes of the mother. The usage is not Seminole only, but the same with all the Indians of America.

confirm it. They feared even to advocate what they had done. They remained silent.

'Enough!' said Opeola, who had not yet publicly expressed his opinion, but who was now expected to speak, and was attentively regarded by all. 'The chiefs have declared themselves; they refuse to sign. It is the voice of the nation that speaks through its chiefs, and the people will stand by their word. The agent has called us children and fools: it is easy to give names. We know that there are fools among us, and children too, and worse than both—traitors. But there are men, and some as true and brave as the agent himself. He wants no more talk—be it so: we have no more for him—he has our answer. He may stay or go.

'Brothers!' continued the speaker, facing to the chiefs and warriors, and as if disregarding the presence of the whites, 'you have done right; you have spoken the will of the nation, and the people applaud. It is false that we wish to leave our homes and go west. They who say so are deceivers, and do not speak our mind. We have no desire for this *fine land* to which they would send us. It is not as fair as our own. It is a wild desert, where in summer the springs dry up, and water is hard to find. From thirst the hunter often dies by the way. In winter, the leaves fall from the trees, snow covers the ground, frost stiffens the clay, and chills the bodies of men, till they shiver in pain—the whole country looks as though the earth were dead. Brothers! we want no cold country like that; we like our own land better. If it be too hot, we have the shade of the live-oak, the big laurel,* and the noble palm-tree. Shall we forsake the land of the palm? No! Under its shadow have we lived; under its shadow let us die!'

Up to this point the interest had been increasing. Indeed, ever since the appearance of Opeola, the scene had been deeply impressive—never to be effaced from the memory, though difficult to be described in words. A painter, and he alone, might have done justice to such a picture.

It was full of points, thoroughly and thrillingly dramatic: the excited agent on one side, the calm chiefs on the other; the contrast of emotions; the very women who had left their unclad little ones to gambol on the grass and dally with the flowers, while they themselves, with the warriors, pressed closely around the council, under the most intense yet subdued interest; catching every look as it gleamed from the countenance, and hanging on every word as it fell from the lips of Opeola. The latter—his eye calm, serious, fixed—his attitude manly, graceful, erect—his thin, close-pressed lip, indicative of the 'mind made up'—his firm yet restrained tread, free from all stride or swagger—his dignified and composed bearing—his perfect and solemn silence, except during his sententious talk—the head thrown backward, the arms firmly folded on the protruding chest—all, all instantaneously changing, as by an electric shock, whenever the commissioner stated a proposition that he knew to be false or sophistic. At such times, the fire-flash of his indignant eye—the withering scorn upon his upcurled lip—the violent and oft-repeated stamping of his foot—his clenched hand, and the rapid gesticulation of his uplifted arm—the short quick breathing and heaving of his agitated bosom, like the rushing wind and swelling wave of the tempest-tost ocean, and these again subsiding into the stillness of melancholy, and presenting only that aspect and attitude of repose wherewith the ancient statuary loved to invest the gods and heroes of Greece.

The speech of Opeola brought matters to a crisis. The commissioner's patience was exhausted. The

time was ripe to deliver the dire threat—the ultimatum—with which the president had armed him; and, not bating one jot of his rude manner, he pronounced the infamous menace:

'You will not sign?—you will not consent to go? I say, then, you *must*. War will be declared against you—troops will enter your land—you will be forced from it, at the point of the bayonet.'

'Indeed!' exclaimed Opeola with a derisive laugh. 'Then be it so!' he continued. 'Let war be declared! Though we love peace, we fear not war. We know your strength: your people outnumber us by millions—but were there as many more of them, they will not compel us to submit to injustice. We have made up our minds to endure death before dishonour. Let war be declared! Send your troops into our land; perhaps they will not force us from it so easily as you imagine. To your muskets we will oppose our rifles, to your bayonets, our tomahawks; and your starched soldiers will be met face to face by the warriors of the Seminole. Let war be declared! We are ready for its tempest. The hail may rattle, and the flowers be crushed; but the strong oak of the forest will lift its head to the sky and the storm, towering and unscathed.'

A yell of defiance burst from the Indian warriors at the conclusion of this stirring speech; and the disturbed council threatened a disruption. Several of the chiefs, excited by the appeal, had risen to their feet, and stood with lowering looks, and arms stretched forth in firm, angry menace.

The officers of the line had glided to their places, and in an undertone ordered the troops into an attitude of readiness; while the artillerymen on the bastions of the fort were seen by their guns, while the tiny wreath of blue smoke told that the fuse had been kindled.

For all this, there was no danger of an outbreak. Neither party was prepared for a collision at that moment. The Indians had come to the council with no hostile designs, else they would have left their wives and children at home. With them by their sides, they would not dream of making an attack; and their white adversaries dared not, without better pretext. The demonstration was only the result of a momentary excitement, and soon subsided to a calm.

The commissioner had stretched his influence to its utmost. His threats were now disregarded as much as had been his wheedling appeal; and he saw that he had no longer the power to effect his cherished purpose.

But there was still hope in time. There were wiser heads than his upon the ground, who saw this: the sagacious veteran Clinch and the crafty Ringolds saw it.

These now gathered around the agent, and counselled him to the adoption of a different course.

'Give them time to consider,' suggested they. 'Appoint to-morrow for another meeting. Let the chiefs discuss the matter among themselves in private council, and not as now, in presence of the people. On calmer reflection, and when not intimidated by the crowd of warriors, they may decide differently, particularly now that they know the alternative; and perhaps,' added Arens Ringgold—who, to other bad qualities, added that of a crafty diplomatist—'perhaps the more hostile of them will not stay for the council of to-morrow: you do not want *all* their signatures.'

'Right,' replied the commissioner, catching at the idea. 'Right—it shall be done;' and with this laconic promise, he faced once more to the council of chiefs.

'Brothers!' he said, resuming the tone in which he had first addressed them; 'for, as the brave chief Holata has said, we are all brothers. Why, then, should we separate in anger? Your Great Father would be sad to hear that we had so parted from one another.'

* *Magnolia grandiflora*. So styled in the language of the Indians.

I do not wish you hastily to decide upon this important matter. Return to your tents—hold your own councils—discuss the matter freely and fairly among yourselves, and let us meet again to-morrow: the loss of a day will not signify to either of us. To-morrow will be time enough to give your decision; till then, let us be friends and brothers.'

To this harangue, several of the chiefs replied. They said it was 'good talk,' and they would agree to it; and then all rose to depart from the ground.

I noticed that there was some confusion in the replies. The chiefs were not unanimous in their assent. Those who agreed were principally of the Omatia party; but I could hear some of the hostile warriors, as they strode away from the ground, declare aloud their intention to return no more.

CHAPTER XXX.

TALK OVER THE TABLE.

Over the mess-table I gathered much knowledge. Men talk freely while the wine is flowing, and under the influence of champagne, the wisest grow voluble.

The commissioner made little secret either of his own designs or the views of the president, but most already guessed them.

He was somewhat gloomed at the manner in which the day's proceedings had ended, and by the reflection that his diplomatic fame would suffer—a fame ardently aspired to by all agents of the United States government. Personal slights, too, had he received from Ogeola and others—for the calm cold Indian holds in scorn the man of hasty temper; and this weakness had he displayed to their derision throughout the day. He felt defeated, humiliated, resentful against the men of red skin. On the morrow, he flattered himself he would make them feel the power of his resentment—teach them that, if passionate, he was also firm and daring.

As the wine warmed him, he said as much in a half-boasting way; he became more reckless and jovial.

As for the military officers, they cared little for the civil points of the case, and took not much part in the discussion of its merits. Their speculations ran upon the probability of strife—war, or no war? That was the question of absorbing interest to the men of the sword. I heard much boasting of our superiority, and decrying of the strength and courage of the prospective enemy. But to this, there were dissentient opinions expressed by a few old 'Indian fighters' who were of the mess.

It is needless to say that Ogeola's character was commented upon; and about the young chief, opinions were as different as vice from virtue. With some, he was the 'noble savage' he seemed; but I was astonished to find the majority dissent from this view. 'Drunken savage,' 'cattle thief,' 'impostor,' and such-like appellations were freely bestowed upon him.

I grew irate; I could not credit these accusations. I observed that most of those who made them were comparative strangers—new-comers—to the country, who could not know much of the past life of him with whose name they were making so free.

The Ringgolds joined in the calumny, and they must have known him well; but I comprehended their motives.

I felt that I owed the subject of the conversation a word of defence; for two reasons: he was absent—he had saved my life. Despite the grandeur of the company, I could not restrain my tongue.

'Gentlemen,' I said, speaking loud enough to call the attention of the talkers, 'can any of you prove these accusations against Ogeola?'

The challenge produced an awkward silence. No one could exactly prove either the drunkenness, the cattle-stealing, or the imposture.

'Ha!' at length ejaculated Arens Ringgold, in his shrill squeaky voice, 'you are his defender, are you, Lieutenant Randolph?'

'Until I hear better evidence than mere assertion, that he is not worthy of defence.'

'Oh! that may be easily obtained,' cried one: 'everybody knows what the fellow is, and has been—a regular cow-stealer for years.'

'You are mistaken there,' I replied to this confident speaker; 'I do not know it—do you, sir?'

'Not from personal experience, I admit,' said the accuser, somewhat taken aback by the sudden interrogation.

'Since you are upon the subject of cattle-stealing, gentlemen, I may inform you that I met with a rare incident only yesterday, connected with the matter. If you will permit me, I shall relate it.'

'Oh! certainly—by all means, let us have it.'

Being a stranger, I was indulged with a patient hearing. I related the episode of lawyer Grubbs's cattle, omitting names. It created some sensation. I saw that the commander-in-chief was impressed with it, while the commissioner looked vexed, as if he would rather I had held my tongue. But the strongest effect was produced upon the Ringgolds—father and son. Both appeared pale and uneasy; perhaps no one noticed this except myself, but I observed it with sufficient distinctness to be left under the full impression, that both knew more of the matter than I myself!

The conversation next turned upon 'runaways'—upon the number of negroes there might be among the tribes—upon the influence they would exert against us in case of a conflict.

These were topics of serious importance. It was well known there were large numbers of black and yellow men 'located' in the reserve: some as agriculturists—some graziers—not a few wandering through the savannas and forests, rifle in hand—having adopted the true style of Indian hunter-life.

The speakers estimated their numbers variously: the lowest put them at 500, while some raised the figure to 1000.

All these would be against us to a man. There was no dissent to that proposition.

Some alleged they would fight badly; others, bravely; and these spoke with more reason. All agreed that they would greatly aid the enemy, and give us trouble, and a few went so far as to say that we had more to fear from the 'black runaways' than the 'red runaways.' In this expression, there was a latent jest.*

There could be no doubt that the negroes would take up arms in the pending struggle; and no more, that they would act with efficiency against us. Their knowledge of the white man's 'ways' would enable them to do so. Besides, the negro is no coward; their courage has been oftentimes proved. Place him in front of a *natural* enemy—a thing of flesh, bone, and blood, armed with gun and bayonet—and the negro is not the man to flinch. It is otherwise if the foe be not physical, but belonging to the world of Obeah. In the soul of the unenlightened child of Africa, superstition is strong indeed; he lives in a world of ghosts, ghouls, and goblins, and his dread of these supernatural spirits is a real cowardice.

As the conversation continued on the subject of the blacks, I could not help noticing the strong animus that actuated the speakers—especially the planters in civilian garb. Some waxed indignant—even wroth to vulgarity—threatening all sorts of punishment to such runaways as might be captured. They gloated over

* The Seminoles were originally of the great tribe of Muscogees (Creeks). Seceding from these, for reasons not known, the Seminoles passed southward into Florida; and obtained from their former kindred the name they now bear, which in their own tongue has the signification of 'runaway.'

the prospect of restoration, but as much at the idea of a not distant revenge. Shooting, hanging, burning, *barbecuing*, were all spoken of, besides a variety of other tortures peculiar to this southern land. Rare punishments—no lack of them—were promised in a breath to the unfortunate absconder who should chance to get caught.

You who live far away from such sentiments can but ill comprehend the moral relations of caste and colour. Under ordinary circumstances, there exists between white and black no feeling of hostility—quite the contrary. The white man is rather kindly disposed towards his coloured *brother*; but only so long as the latter opposes not his will. Let the black but offer resistance—even in the slightest degree—and then hostility is quickly kindled, justice and mercy are alike disregarded—vengeance only is felt.

This is a general truth; it will apply to every one who owns a slave.

Exceptionally, the relation is worse. There are white men in the southern states who hold the life of a black at but slight value—just the value of his market-price. An incident in the history of young Ringgold helps me to an illustration. But the day before, my 'squire' Black Jake had given me the story.

This youth, with some other boys of his acquaintance, and of like dissolute character, was hunting in the forest. The hounds had passed beyond hearing, and no one could tell the direction they had taken. It was useless riding further, and the party halted, leaped from their saddles, and tied their horses to the trees.

For a long time the baying of the beagles was not heard, and the time hung heavily on the hands of the hunters. How were they to pass it?

A negro boy chanced to be near 'chopping' wood. They knew the boy well enough—one of the slaves on a neighbouring plantation.

'Let's have some sport with the darkie,' suggested one.

'What sport?'

'Let us hang him for sport.'

The proposal of course produced a general laugh.

'Joking apart,' said the first speaker, 'I should really like to try how much hanging a nigger *could* bear without being killed outright.'

'So should I,' rejoined a second.

'And so I too,' added a third.

The idea took; the experiment promised to amuse them.

'Well, then, let us make trial; that's the best way to settle the point.'

The trial was made—I am relating a *fact*—the unfortunate boy was seized upon, a noose was adjusted round his neck, and he was triced up to the branch of a tree.

Just at that instant, a stag broke past with the hounds in full cry. The hunters ran to their horses, and in the excitement, forgot to cut down the victim of their devilry. One left the duty to another, and all neglected it!

When the chase was ended, they returned to the spot: the negro was still hanging from the branch—he was dead!

There was a trial—the mere mockery of a trial. Both judge and jury were the relatives of the criminals; and the sentence was, that the negro *should be paid for!* The owner of the slave was contented with the price; justice was satisfied, or supposed to be; and Jake had heard hundreds of white Christians, *who knew the tale to be true*, laughing at it as a capital joke. As such, Arens Ringgold was often in the habit of detailing it!

You on the other side of the Atlantic hold up your hands and cry 'Horror!' You live in the fancy you

have no slaves—no cruelties like this. You are sadly in error. I have detailed an exceptional case—an individual victim. Land of the workhouse and the jail! your victims are legion.

Smiling Christian! you parade your compassion, but you have made the misery that calls it forth. You abet with easy concurrence the *system* that begets all this suffering; and although you may soothe your spirit by assigning crime and poverty to *natural causes*, nature will not be impugned with impunity. In vain may you endeavour to shirk your individual responsibility. For every cry and canker, you will be held responsible in the sight of God.

The conversation about runaways naturally guided my thoughts to the other and more mysterious adventure of yesterday; having dropped a hint about this incident, I was called upon to relate it in detail. I did so—of course scouting the idea that my intended assassin could have been Yellow Jake. A good many of those present knew the story of the mulatto, and the circumstances connected with his death.

Why was it, when I mentioned his name, coupled with the solemn declaration of my sable groom—why was it that Arens Ringgold started, turned pale, and whispered some words in the ear of his father?

THE LOST TOWNS OF YORKSHIRE.

TEACHERS being supposed to know everything, I, as an instructor of youth, took shame to myself for being unable to answer a question addressed to me by a young pupil a week or two ago. It was this: 'Where is Ravenspur? The history of England tells us that the Duke of Lancaster, afterwards Henry IV., landed at Ravenspur in Yorkshire in 1399; but we cannot find its name on the map, or any mention of it in our geographies.'

This question disconcerted me not a little. I had taken Ravenspur for granted. Although I had, in the course of twenty years as pupil and teacher, heard the name of the landing-place of Henry of Bolingbroke repeated times out of count, I had passed it without seeking any further acquaintance, and was now non-plussed by a simple question from a child. I was ashamed to own that I could tell her nothing, so I had recourse to finesse. 'I will give you,' said I, 'until to-morrow morning to try to obtain the information for yourself; should you fail, I will then furnish you with all needful particulars.' I knew that before another day I should ascertain all about Ravenspur, if the children could not; and by this little stratagem preserve my reputation for unlimited knowledge. My first clue to the whereabouts of Ravenspur—I was going to say, but the term is improper, for it has no whereabouts—was obtained from the encyclopedia, and this gained, the rest was easy. I need not tell how my pupils were unsuccessful in their search, from not knowing how to set about it, or how my newly gained knowledge was imparted to them in turn. But the subject interested me, and I have since acquired additional particulars connected with it, which I have gathered from various sources, including my own recollections of the locality.

The first bit of information I obtained was, that Ravenspur was, but is not; that place, and a number of other ports and towns in the Holderness district of Yorkshire, having been gnawed away piecemeal and swallowed up by the German Ocean.

Like the celebrated 'Big-bellied Ben' of our nursery-days, this glutton has deliberately washed down into his maw, ports, villages, churchyards with their human remains, and even churches. Like the nursery hero, he has not spared even the steeples; for, unable to toss his briny arms quite so high, he has stolen away

the ground from under them, and thus they became an easy prey to his insatiable appetite. Insatiable, I say, for the depredations of the ogre still continue; and since he is a foe against whom all valour is useless, and on whom weapons, whether offensive or defensive, produce no impression, in all probability much of the Holderness division of Yorkshire will in the course of a few generations disappear.

Lest this may seem too bold an assertion, let us glance backward over a similar space of time, and tell what the sea has done, and still continues doing.

Poulson, in his learned and elaborate *History of Holderness*, mentions a number of lost towns which, from records of undoubted authenticity still extant, must have been places of considerable importance in their day. Of these, perhaps the most important was Ravenspur. It was known by the various names of Ald Ravenser, Ravenesse, Ravensburgh, and Ravenspur or Spurn. It stood in the parish of Kilnsea, and had a neighbour named Ravenser Odd, with which it was often confounded. Both were ports, though the latter was a place of more recent growth, and both have alike perished from the same cause. Ravenser Odd, supposed by some to have been an offshoot of Ravenspur, was begun, rose into importance, and perished by the encroachments of the sea within a century and a half. As to its magnitude, nothing can be ascertained; but it was so large as to excite the jealousy of the 'goodmen of Grimsby,' who envied the prosperity of their opposite and rival neighbour on the Humber, little deeming how soon that arm of the sea would avenge their grievances, by swallowing up every vestige of their opponent.

When Hull, large and thriving as it now is, paid L.100 for its charter, this port paid L.204 for a similar one; and in the fourth and eighth years of Edward II.'s reign, it was called upon to supply a vessel to aid the king in his expeditions against Scotland, besides having to answer sundry demands made upon it for arms and provisions.

In a manuscript of 1240 is the first mention of Ravenser Odd. In 1396, it was totally destroyed and forty years previous to this catastrophe, orders were given to remove the uncovered bodies of the dead from its churchyard, and re-inter them in that of Easington.

Ravenspur, three years after the destruction of its neighbour, witnessed the landing of Henry of Bolingbroke. Shakespeare, in *Richard II.*, has recorded this, and tells how

The banished Bolingbroke repeals himself,
And with uplifted arms has safe arrived
At Ravenspur,

besides alluding to it in several other parts of the same play; and, singularly enough, Edward IV., then the banished monarch of his rival race, was driven by stress of weather to land there on the 14th of March 1471. A beautiful cross, supposed to have been originally erected at Ravenspur to commemorate the arrival of 'the banished Bolingbroke,' after two removals to prevent its being washed away, has found, it is to be hoped, a resting-place at Hedon. At what date the port finally disappeared, is not known, as no vestige remains, even of its site, to afford any clue.

But although it is probable that no place of greater importance than Ravenspur has been thus swept away, it has not gone alone. Besides it, Poulson mentions Redmare, Tharlesthorp, Frismerah, Potterfleet, and Upsal, amongst the towns lost from the Yorkshire coast of the Humber. It is not known when they first disappeared, but the manor of Tharlesthorp was swept away in 1893, though the monks of Meaux, who drew a fat revenue therefrom, had previously erected a bank as a defence against the rebellious arm of the sea, which had often threatened to rend it from them, before it finally succeeded. No trifling loss it was,

since, fifty years before, it yielded them a rental of L.111, 8s.—a very large sum in the good old times; and only three years later, the monks complained that their lands in Frismerah had also been seized by the same rapacious foe. Camden names Potterfleet and Upsal, but nothing more is known of them, or of a place called Penismerk. The places above enumerated were all on the bank of the Humber, with the exception of the last three, the sites of which are unknown.

On the shores of the main ocean, towns and hamlets bearing the names of Hartburn or Auburn, Winkton, Hornsea Beck, and Hyde or Hythe, have been submerged. The luckless monks of Meaux had cause again to mourn the loss of tithes, for Hyde paid L.30 per annum as its tithe of fish. The finny tenants of the sea, could they have derived any satisfaction from the fact, were amply avenged by their native element, which swallowed up Hyde altogether, thus putting an effectual stop to its fisheries.

Hornsea, now a pleasant and quiet watering-place, with something less than a thousand inhabitants, was a port in the thirteenth century, and possessed a pier and harbour in the reign of Queen Elizabeth; but this port, called Hornsea Beck, with pier and all connected with it, has long since disappeared. From 1546 to 1609, when the pier was destroyed, thirty-eight houses, and as many small closes adjoining, were decayed by the flowing of the sea; and the coast, for a mile in length, had during the same period suffered an average annual diminution of four yards.

The appetite of this sea for churches rivals that of the far-famed Dragon of Wantley, though, more merciful than this latter celebrity, its invasions have never molested or swallowed their congregations. Besides those that probably existed in the lost towns already enumerated, others at Aldborough, Withernsea, Owthorne, Kilnsea, and a parochial chapel at Colden Parva, have gone the way of all churches on the Holderness part of the Yorkshire coast.

Strange scenes have been witnessed during the progress of these inroads. Sir George Head gives a graphic description of one he saw in 1835, when walking from Spurn to Kilnsea. Not having the *Home Tour* at hand, I cannot give his exact words; but he tells us that he was shocked to observe human remains strewn, and by no means sparingly, on his path; and that, believing them to be the bones of shipwrecked mariners, he was led to form no very favourable opinion of the people who could permit these tempest-tossed relics of humanity to remain exposed to the winds and waters. A very short time sufficed to convince him of his mistake; the bones having been perhaps centuries buried, but only now torn from their resting-place in Kilnsea churchyard. The church fell about nine years before his visit; and gazing upwards at the churchyard from the shore, he saw rows of coffins, or parts of them, with their ghastly tenants, some mere fleshless skulls, exposed to view.

A friend of my own, whose hair is now but slightly sprinkled with gray, has just given me a similar account of Owthorne Church and Churchyard, as it appeared in his boyhood.

'When about thirteen years old,' said he, 'I accompanied my father to the shore. In those days, I was not a very good jockey, and a spirited mare on which I was riding manifested her dislike to the human bones, with which she could scarcely help coming in contact, in so disagreeable a manner, that I found it a difficult matter to keep my seat. After an absence of many years, being near Owthorne, I resolved to revisit the spot which had so forcibly attracted my boyish attention. But after vainly endeavouring to find it, I applied to a female passer-by, and was informed that since 1838 scarcely a vestige of either church or churchyard could be discovered.'

A rather amusing tradition of the origin of Owthorne Church is still told. The manors of Owthorne and Withernsea were owned by two maiden sisters, who resolved to build a church, and one was commenced at the former place. All went on smoothly for a while, when a quarrel arose between the damsels, the one wishing for a spire, the other for a tower. A wily monk, who was wide awake to the interests of 'the establishment' of those days, suggested, by way of removing the difficulty, that each should build a church in her own domain; which was accordingly done, and they ever afterwards bore the name of 'The Sisters.' This tradition has been disputed; but it matters little now, since both founders and churches are crumbled to dust. Withernsea lost a former church in 1444, and it was four years after that the 'Sister Kirk' above alluded to was commenced.

When the British Association met at Hull, several papers were drawn up relative to the depredations of the sea on the Holderness coast, and from them it appears, that though the annual rate of diminution amounts to as much as seven and a half yards in some parts, it is in others but trifling. Still, the average annual decrease amounts to two yards and a half along the whole coast-line. A bite of thirty miles in length, and the above-mentioned width, is no trifle.

It may not be uninteresting to add a few further data, partly from the works of Poulson and Bedell, the historian of Hornsea, and partly from the papers submitted to the British Association. Poulson says, the cross at Atwick, which was, in 1786, distant from the sea thirty-three chains, sixty-one links, is now, in 1840, scarcely half that distance. Aldborough Church, in 1786, 2044 yards from the sea, is now a mile. An inn built in 1847 at Kilnsea, is now only 480 yards or thereabouts from the sea; whereas, when erected, it was 534. Holmpton Church in seventy years is nearly 100 yards nearer the ocean. At Mappleton, the loss is about three yards annually.

My maternal grandfather, a Holderness man, of course remembered and spoke of various incidents connected with this, to him, most interesting topic. He used to say that Hornsea Church, now 934 yards, was at one time ten miles distant from the sea. In proof of this assertion, he quoted the following rhyme, said to have been inscribed on its steeple:

Hornsea steeple, when I built thee,
Thou was ten miles off Burlington,
Ten miles off Beverley, and ten miles off sea.

As this inscription is merely traditional, and Poulson can find nothing to justify such an assertion as the last line contains, he gives the following humorous explanation. He says, our forefathers were extremely liberal with their ciphers, and often made use of them when only writing a figure expressing a unit. He quotes the following example from some parish books: 'In copying the churchwarden's accounts in 1660, a payment to the painter is made to be L.10, 14s.; whereas in the original document it stood thus, L.01, 14s. 00d.;' a waste of ciphers which reads oddly enough in modern eyes. He thinks, therefore, that by a similar transfer of the cipher by some illiterate person, the one mile has been stretched to ten.

This explanation certainly sounds plausible; but the church was, in a great measure, rebuilt in the fifteenth century, and if it was then a mile from the sea, it would since that date have lost about a couple of yards per annum, which is the average loss at present in that particular locality. But one instance of comparatively modern times may be quoted, which seems to bring the ten miles quite within the range of possibility. A notorious pirate and smuggler named Pennel, murdered his captain, and sank the vessel near Hornsea. He was tried in London, and his body sent thence to the scene of his crimes, to be exposed on a gibbet on

the north cliff, in 1770. From the parish register, it appears that, in 1780, this gibbet was fifty-six feet from the sea-cliff; and six years later, it was entirely washed away. Perhaps the German Ocean never took a bite which gave the same cause for satisfaction as when it swallowed this disgusting relic of barbarity.

The visitors to this Yorkshire watering-place will find little in the way of gaiety; but those who seek quiet, and love to investigate the geological remains of past ages, may find a rich field for study and exploration. Sir George Head uses enthusiastic terms in mentioning it. He says: 'Of all parts of England, the eastern coast exhibits the most apparent phenomena of diluvial action; of all parts of the eastern coast, that of Holderness; and of all parts of Holderness, the country in the immediate neighbourhood of Hornsea. Here the earthy cliffs form a concrete mass of heterogeneous matter, studded with shells and fossils; seaward, a black line or reef of peat resembling rocks marks the ancient position of a forest below highwater-mark, now washed by the waves of every succeeding tide. Further on, he quotes the words of Ovid, written two thousand years ago:

The face of places and their forms decay,
And that is solid earth which once was sea;
Seas, in their turn, retreating from the shore,
Make solid land what ocean was before;
And far from strands are shells of fishes found,
And rusty anchors fixed on mountain ground;
And what were fields before, now washed and worn
By falling floods, from heights to valleys turn.

Of the peat before mentioned, Sir George adds: 'I gathered a handful which yielded like dough, and kneading it into a ball, retained it in my possession; dry, it became uncommonly hard and sound; when cut by a knife, the divided surface assumed a polish which made it difficult to distinguish whether it were wood or stone. As it exists in considerable abundance, it might perhaps be employed with effect either to the purposes of modelling, or other use requiring matter soft and malleable when moistened with water, but hard when dry.'

We have all read often enough of the changes in the face of nature—how the ocean swallows up in one place, and makes a gradual restitution in another, and how, by means of insect labours, islands rise up in spots where formerly the waves were seen career-ing; but for myself, I can say I never fully realised the extent of these changes, until it was brought home to me by an examination of what has taken place on this small portion of the coast of my native land. There is something affecting in the thought, that where our ancestors ploughed, sowed, and reaped their harvest, the waves now wanton recklessly, themselves ploughed, but 'no longer furrowed,' by the vessels which pass over them; and that where stately forest trees reared their heads, ocean-plants flourish, but far beyond our reach.

Ruthless, however, as the waves have been in spoliation, they have, like penitent robbers, made some attempts at compensation on the Holderness coast. At Paul, great damage was formerly done by the Humber, but between that place and Patrington, thousands of acres of rich land have been recovered by means of embankments. This, however, can scarcely be called voluntary restitution; but at Patrington, great difficulty is experienced in keeping the haven clear, in consequence of the continual warping which takes place there.

Adjoining the lordship of Patrington, is a large tract of land bearing the name of Sunk Island, which has been thrown up by the sea within the last two centuries. It was first noticed as a sand-bank, and was given by Charles II. to the governor of Hull, who had a rabbit-warren on it. Two years later, it was

leased to that gentleman for thirty-one years, at an annual rent of five pounds.

In 1764, 1500 acres of fertile land were under cultivation. Fines were paid at various times for the renewal of the leases; and, just before the expiration of one of these leases in 1802, it was valued by the surveyors from the office of the Woods and Forests at L.9814 per annum. Thirty years later still, Sunk Island measured nearly 6000 acres, and was formed into a parish, with a church endowed by the crown.

Thus has the sea disgorged a great portion of what it had swallowed, and the same process is continually going on. Unhappily, the luckless proprietors, on the wasting side, gain nothing by this compensation of the ocean. The whole of Sunk Island is crown-land, and must be rather an eyesore than otherwise to those whose fate it is to witness a gradual, but certain diminution of their patrimony, by the encroachments of a foe against whom resistance would be useless.

A PASSENGER'S LOG.

I SUPPOSE every passenger, when about to make a sea-voyage, is comforted with the assurance, that his ship stands A1 at Lloyd's, and is built of British oak. I can, at all events, say from my experience, that almost every emigrant with whom I have come in contact infallibly believes that the vessel in which he is to embark is something unusual as to strength, and at some time in its history had made the 'shortest passage' on record. The passengers who embarked for New York in the *Welsh Mountaineer* on the 11th of June in the year of our Lord 1851, could not be comforted with the latter assurance, for it was her first voyage; but the A1 at Lloyd's and the British oak were thrust into the minds of passengers by large placards and persevering agents. Moreover, all C— went out to see her launched, for never before in the maritime history of the town had she had the honour of launching a bark upwards of 700 tons burden. As I had taken a cabin-passage in this vessel, and had watched her building, from the setting of the keel to the nailing of the deck-planks, I went to see how she would take to the water. All C— were, however, destined to be disappointed; for, after a great deal of hammering and shouting, the ship moved on the slips as if about to take to the water gallantly, but the shouting of the crowd was suddenly stopped by her stopping abruptly when half-way down, and refusing to stir. A little knot of old sailors shook their heads ominously, and declared that they never knew a ship make a passage that stuck in the launching. The sequel will prove whether they were right. She was, however, got into the water a day or two after, though no one was there to see; and a little while afterwards a busy steam-tug towed her into the open channel.

I suppose every one who leaves Old England in the distance, has a friend to say 'Good-bye' to, and so the tug was loaded with anxious parents and nervous lovers. As I was going out to recruit shattered health, I formed no exception to the rule, and must confess that when we rounded the roadstead headland, its scenes of alabaster danced fitfully through farewell tears. It was pleasant to us all that we did not at once go into open sea, but passed the Channel between the shores with a favouring breeze. Old England disappeared at last in the fading light of the next day, and we were left to the consolation, that the huge waves that dashed past us broke upon home shores. After a while, on that same evening, the light streamed on the deck from the round-house window, and looking in, I saw the captain studying his chart, and marking out our path upon the high seas. I had leisure for the first time to regard him attentively. I have seen

many better figures than his, for he was short and thick-set, and a little round-shouldered, but a handsomer face it would be hard to find anywhere; and certainly, according to the old phrase, 'a braver man never trod a deck' than Captain Gilbert of the *Welsh Mountaineer*. I saw him afterwards when the gale raged round him, and his voice could hardly be heard in the wild chorus of wind and wave, yet his words and his glance were as kingly as that of the men whom history celebrates for breasting storms ashore.

On looking about me, I found that I had only one companion in the cabin—a lady who was going to America to see her uncle. All the rest of the passengers, to the number of about fifty, were emigrants seeking a home in the New World. For four or five days I had little else to do than to make note mentally—for I found a journal too tedious—of such little incidents as occurred on deck, to watch the sea in its eternal play with the wind, and to wonder it was never tired of the game. Very soon afterwards, however, the face of the ocean had so changed, that no one would have known it to be the same. Its fringing foam was exchanged for an angry, roaring surge. A heavy gale had sprung up from N.N.W., and the *Welsh Mountaineer* was fairly put on her trial, and it must be recorded that for a time she behaved gallantly. I used to sit at the round-house door, looking at the mountain-range of water approaching, as if it must overwhelm us, and wonder how it was possible we could find a pass through its dense mass. Time after time, however, it seemed to open at our approach; and when it did not, it kindly took us on its crest, and sent us gliding on the other side. When I saw the ship standing steadily in dock beside its fellows, I used to think they must be rough waves, indeed, to hurt it; but now I could have no other thought than that the great waves only spared us because they liked a toy to play with.

One night, just after the gale had commenced, there was an unusual noise over my berth in the round-house—moving feet and loud voices, that could be plainly heard above my head, notwithstanding the roar of the wind and the rush of the water. I was too wakeful to sleep, yet too lazy to move; but I could gather from the prodigious rolling of the ship, and the strong blows that made every timber shiver, that the gale was raging terribly.

Dozing towards morning, I was suddenly awaked by a boisterous laugh, mingled with the strangest noise that I had yet heard in the cabin, the effect of which was not at all diminished by a queer sensation of being turned upside down. I looked out quickly, and found that the old sea herself had taken a peep into the cabin. It was rushing against open doors, floating chairs and tables, and soon began inconveniently meddling with portable articles in my cabin. Fortunately my berth was near the roof, so that I could watch its liberties without much personal inconvenience. I stretched my neck across the narrow space between my bed and the cabin door, and found that from stem to stern the sea covered the *Welsh Mountaineer*, and that she was fairly on her beam-ends. Two figures met my glance—there was Captain Gilbert, with a huge hatchet in his hand, breasting the waves with the chivalry of an old knight; and then there suddenly turned up the mate, who, having lower quarters than myself, had been floated out of his bed in his sleep. This at once explained the loud laugh I had heard, and which at first seemed so strange. The expression on his face was ludicrous; for he was evidently not yet aware whether he was awake or dreaming. The captain continued his stern march through the waters, and in another moment the light timber of the bulwarks was giving way to his blows, and the water rushing out at the rent. Most fortunately, the hatchways were fastened down, and no

wave broke over us in the interval, or our fate had been sealed.

The ship soon righted, and we were delivered from immediate peril; but it became evident that she had received a terrible strain, for the morning-watch reported that they could not keep the pumps free. She had formerly made very little water, twenty minutes morning and evening sufficing to keep her free. Every eye was watching the pumps, hoping with each discharge of water to hear them suck; but evening came, and no sign of abatement, but manifest increase. The captain and mate disappeared with a lantern down a hole in the after-cabin, and on their reappearance, the former taking me by the arm on the quarter-deck, said quietly: 'You are not afraid of learning bad news; I cannot take her over: the *Welsh Mountaineer* must go down at sea.' I have not before said that she was laden with railway iron; and I now learned that, when on her beam-ends, some unequal strain had forced a plank.

The gale continued with unabated fury, and it soon became evident that the crew would be quite unable to manage the ship and work the pumps. The next morning, all the male passengers assembled on the quarter-deck, and relays were formed to work with the watch. If the experience of the *Welsh Mountaineer* be that of all foundering ships, there was nothing of the terror and excitement of a ship breaking on an ice-mountain, or of one dashed upon a rock; it was more like the trench-work of a siege. As the second day wore on, and the light began to fade, and it became evident to all that the leak gained, a dead silence reigned over all the ship. I can see the group at the pump now; they all looked as if they were wondering what they could say to their wives and little ones when they went down the ladder. There was an old man, whose figure and visage had a solemn look in the dying day. His white hair blew in gusts over his face, like snow-drifts before the breath of the gale. He clutched the levers, as if he held himself upright with them, rather than rendered any help. Nor was it a seeming only, for while I was regarding him attentively, a 'weather-roll' of the ship, and a heavy sea that swept the decks at the same time, carried him right off his legs to the break made in the bulwarks the day before. The splintered timbers gave way even to his feeble grasp, and he must have been lost, but for the quick rush of the captain to his aid. Never shall I forget the night that succeeded. I was in no way terrified, yet sleep was out of the question at such a time. Although the storm had been raging for nearly three days, it was now at its height. I kept the deck throughout the night, moving about as much as the violent and eccentric movements of the ship would allow. The night was densely dark, and I could only just discern the 'teeth of the sea' in the gloomy wilderness around us. The moon was in her first quarter, and appeared once or twice that night. It cast little light on us, but enough just to reveal great dark clouds hurrying through the heavens, as if on some work of death. The noise of the wind was deafening; I scarcely knew which was the loudest—the everlasting roar it made with the waves, or its rushes through spars and sails and open places in the ship. Added to this, there was the constant motion of the pumps beating time to the rough music of the tempest, and the now plainly heard movement of the water in the hold, as it moved with the pitching of the vessel. When we first heard it, the sound was like that made by waves retiring from the narrow gullies of a rock; but as the night advanced, it grew deeper and more sonorous.

There were groups in earnest consultation on deck; and a little after midnight the captain lit his lamp in the round-house, and invited me in. He told me there was scarcely a chance of the ship keeping above

water for twenty-four hours, and that he was sorry to say there were not enough boats to save the passengers, even if the weather were favourable, and that our only chance was to fall in with a vessel, which in that latitude was but a poor look-out. This was not pleasant news, considering that we were fully a thousand miles from any land. 'Keep a brave heart, my boy,' said the captain, 'and if you go overboard, have a last blow for it,' as we sat down on the lee-floor to a midnight meal of corned beef and coffee.

It may startle the reader if I say that it is worse to hear the recital of a scene like this than to be in it, yet my experience tells me it is so. There are resources at the actual time which we never dream of when in safety; how else can we account for the heroism with which such dangers are generally borne? There are stories of soldiers who have stood, as upon parade, in a sinking ship, and coolly fired their own death-knell as they went down. I can well imagine these recitals to be true, for that night, when death seemed to be near, the captain and myself talked of old adventures, and told quaint stories; and though it has often seemed strange to me since, there was nothing forced or unnatural in it at the time. My companion in the cabin kept up a brave heart, but lost her appetite. By the dim light of the cabin-lamp we conversed about old times, and told our histories to each other.

One wish with reference to our apparently inevitable fate we both uttered, and but one—it was, that we might go down in broad daylight. It was an odd desire; but perhaps the darkness of the sea made the shadow of the silent land weigh more heavily upon us.

The cold leaden gray of the next morning came at length. Did ever such a morning dawn in my short life? Far off, over the cold waste of waters, in the hazy light of half-past three on a June morning, better eyes than mine had spied a sail. My first notice of it was the rush of the mate into the cabin, who seized the glass with a convulsive grasp, and made for the top of the round-house. He said not a word until his well-trained eye was sure of the prize, and then, with a voice that rang wildly on the wind, cried out: 'A sail—a sail to windward!' What a scene followed! The captain rushed from the round-house, the morning-watch turned out from the fore-deck, and in a moment more the hatchways, yet unopened, burst like a bomb-shell. Then poured forth from below every soul on board—man, woman, and child. The scene that followed baffles description. Many for the first time understood the immediate danger that threatened the ship; the wild cry they had heard a moment before told it all. Every eye was turned towards the direction which the captain's glass now took, but scarcely one could discern the black speck only just visible to sea-eyes. From such a prospect, fewer still could realise the possibility of help. I turned from the sea to the shivering group upon the deck. All the pent-up excitement of the last three days burst forth in the ecstasies of despairing love. Mothers were embracing their little ones, and rougher hands than theirs were busy at gentle work.

As the morning wore on, and the light was stronger, it became evident that there were two vessels about eight or ten miles to windward, one considerably in advance of the other, but both some miles astern. As soon as it was of any use, we hoisted the signal of distress—the merchant ensign inverted—and, lest that should escape observation, we hauled up the sails so as to shew that something was wrong. You may imagine the interest with which every one watched the progress of the nearest ship to see whether she would take any notice of us. For two long hours, every eye was fixed on her as she came steadily on, but without making any alteration in her course so as

to reach us. For a long time, the stillness of death prevailed; but when she came fairly abreast of us at the distance of six or seven miles, and threatened to pass us without the slightest notice, cries hoarse with despair clove the wind. The cries were useless, for she was to windward. We had no powder on board to make any further signal; but there can be no possible doubt she saw us and knew our condition. She *did* pass us, and steered away. We found out the nation she belonged to; but it need not be mentioned here. Let her flag perish from our recollection; but let it be known she was *not English!*

With redoubled anxiety, we now turned to our second and last remaining hope. Another hour of weary watching, that seemed an eternity. Her course lay a little nearer to us than the first, so that we could see her more distinctly. For a while, our signals seemed to promise no better success. At length the better eyes thought they could discern something black moving quickly up the head-mast; a moment more, and a red rag streamed on the wind. At this instant, the mate, who was standing on the bulwarks, looking intently through the glass, shook all over with violent emotion; the glass in his hand shared its convulsive movement, and a moment afterwards he sprang to the deck, and cried out, the 'Union Jack!' O ye who think that flags and standards are but the baubles of the brave, think how ye wrong the language of the heart's true chivalry! If we had been nearer, we should have heard that an English voice had already given the command to 'bout ship!' and have known surely that British hands handled the tackle. It was not long before she veered round, and the whole breadth of her canvas came to view. On she sped like an angel of mercy, with her wings spread to the favouring gale. I knew it was quite an hour before she could reach us, so I went straight into the cabin, and for the first time for two nights I slept soundly for just three-quarters of an hour. When I awoke, there was a stately ship just passing under our stern, and taking up her station about half a mile to leeward, to avoid collision in the heavy sea. Now came a fresh anxiety, for in the sea that was running, no boat could come close alongside, and the captain very much feared some lives might be lost in changing ships. It was yet tolerably early, and after a consultation through trumpets, it was deemed advisable to wait an hour or two. Towards afternoon, the wind happily lulled, and the sun shone out for the first time since our troubles commenced, though the sea was still heavy. But I will not enter into further detail; let it suffice to record, that the disembarkation was managed with consummate skill, and that after four hours of hard work, every woman, child, and man was safe on board the *Lesmahagow*, bound for St John's, New Brunswick, without a child's finger being hurt. Often, when a boat-load started from the *Welsh Mountaineer*, we lost sight of them altogether in the trough of the sea; but as often we could hear the cheers of the sailors giving courage to their trembling cargo.

The rest of the voyage had nothing specially interesting. We made the first landmark at night: I shall not soon forget it. We were growing somewhat uneasy in the fogs and cross-currents of the Bay of Fundy; but in the night the fog cleared off, leaving a clear dark air. The twelve o'clock watch had hardly taken their station when the word was given, a 'light on the starboard bows.' It grew larger as we neared it, and seemed to our grateful sight as if some spirit of mercy held out calmly its torch of light and love above a thousand storms that roared at its feet, an eternal welcome to poor tempest-driven wanderers.

Next morning I was awakened by a sound like the driving of a hundred hammers at the ship; I jumped out of my cabin in alarm; but a rough kind voice I

had often heard before said: 'The anchor, sir—the anchor.' I dressed hastily, and going on deck, saw the city of St John's lying in the light of a bright July morning. The angry waves had ceased, and broke in gentle ripples with a home-sound upon the vessel's side.

Our first business when on shore was to make public in the newspapers our grateful thanks to the two captains to whom, under providence, we owed our lives. I know not what has become of either of them. I have not seen them since my return to England; but if this brief sketch should be seen by them, let it serve as assurance that the kindness of the captains and crews of both vessels will ever be held in remembrance by the living freight the old *Lesmahagow* bore into the harbour of St John's.

MUSIC.

'Tis true no verse of mine can tell,
Fair lady, what the gentle breath
Within the flute, that rose and fell
And died in the far distance, saith:
The speechless echoes linger still;
Their meaning is not of the earth.
Thou know'st no less love's accents thrill,
Although the words be nothing worth:
The perfect sense we cannot tell,
And thence the glory grows the more.
The organ-billows, as they swell,
Roll far and farther from the shore,
Until from verge to verge they sweep,
And Thought, its wearied wings drooped down,
Slow sinking in the charmed deep,
'Mid the sweet thunder loves to drown.
The harp-voice best we understand;
Its grief is shaped by her who flings
Athwart its face the gentle hand,
And hides, in ruth, the sobbing strings.
The brazen trumpet's war-note shrill
Would ever teem with stir and life,
Although the earth had lost its ill,
And there was end to foemen's strife;
And though the cymbals ceased to beat
Amid the ranks of bristling steel,
They'd aye recall the thousand feet
In motion at the single will.
But what of war, the while we hear
These Christmas bells o'er hill and plain,
And all our memories drawing near,
Entrance us with a pleasant pain,
And fill our hearts with love and peace,
And lead us like an angel hand
Whereto the wondrous harmonies
Sweep away through the Better Land. J. P.

ROYAL NATIONAL LIFE-BOAT INSTITUTION.

This institution expended during the past year L.3421 in building eleven new life-boats, and in altering and repairing several others; L.1292 in building and in repairing life-boat houses; L.787 in building new life-boat transporting-carriages and in repairing others; L.855 in payment to cockswains and crews of life-boats; and L.578 for rewards for saving the lives of 376 persons, shipwrecked on our coasts, of which 132 were actually rescued by the life-boats of the society in that period. Its outstanding liabilities for life-boats, life-boat carriages, and boat-houses are L.3394. It would be needless to expatiate on the merits of an institution like this. The merchant, shipowner, or underwriter who does not support it, neglects his duty; while the philanthropy of private individuals could not elsewhere find a more meritorious channel.

A SEA-SIDE SHOW.

If I were asked what was the special attraction which drew me to Boulogne last August, I should be rather puzzled for an answer. It was not the camp in the neighbourhood, for that was not then a source of attraction to anybody. It was not that I had any little financial difficulty to contend with—any temporary congestion of credit or collapse of pocket—for which the air of Boulogne is notoriously so beneficial. Nor was it because I had any friend to visit, who, being under a cloud at home, had sought sunshine on that sunshiny coast. I have no grand friendships to boast; the few whose confidence I share are of that old-fashioned, slow, and vulgar class who look upon twenty shillings in the pound as a matter of religious principle, and want that moral courage, so remarkably general in this great age of progress, which enables its possessor coolly to turn his back upon his creditors, and to liquidate by a few months of agreeable exile abroad, the expense of his agreeable relaxations at home. It was not, either, the prospect of pleasant society, for I knew nobody in the town, where, though it had lain in my route a dozen times, I had never as yet spent twenty-four hours at a visit. And, least of all, was it the expectation of seeing what I did see; for if these coming events cast their shadows before, they had never fallen on my path; and it was in utter ignorance of what was about to take place that, before the month was a week old, I had crossed the strait, extricated my valise and carpet-bag from the fangs of the douaniers, and taken lodgings by the week in a quiet-looking café in a turning-out of the Grande Rue, not far from the highest ground of the ramparts.

The café, neat, clean, and comfortable, was kept by the Widow R—, and it was pleasant to find that in the domestic arrangements regard was had to island notions and predilections. Madame spoke little English, but then she had a daughter, a lively lass of sixteen, with black eyes and a face that would have been exceedingly pretty but for a rather damaging prominence of the cheek-bones, who chattered our insular tongue with astonishing volubility, and with the most charming accent imaginable. Both mother and daughter cheated me in numberless small matters; but as I did not object to their trifling peccadilloes, or disturb their self-love by rebuking them, they treated me in all other respects with notable consideration, and I thought that, on the whole, I had reason to congratulate myself on my quarters.

There was constantly coming to the house—now mingling with the guests in the common room, now closeted with madame and the daughter—a good-

looking florid-faced young priest, or acolyte, full of vivacity and apparently of business. I soon perceived that both the ladies, and the younger especially, were living in a condition of excitement, which, so far from subsiding, seemed hourly to increase, and that the priestly visitor was in some way or other connected with the cause. On the third day of my domiciliation, while Jeannette was arranging my breakfast, after my morning-bath in the sea, I mentioned the subject of the priest, confessing the curiosity his visits had excited, and wondering whether there was a matrimonial termination to be expected—who could be the happy man, and whether either of the ladies, Jeannette, for instance, was to be the bride.

Jeannette did not blush; she only turned to me, as she paused in her operations, a face of mingled astonishment and incredulity.

Monsieur did not know! O but that was strange, when all the world was coming to Boulogne this month to assist in the installation of Our Lady—and monsieur really did not know?

I assured her that I knew nothing about the installation, or of Our Lady of Boulogne either—who was she?

'O but that is droll,' said Jeannette; 'but I forget—you English are all Protestants—what pity! Shall I tell you about Our Lady of Boulogne?'

'Thank you—I wish you would.'

I drew a chair for Jeannette as I spoke; she sat down with an air of perfect self-possession, and having handed me a cup of coffee, began enlightening my ignorance, speaking with a very grave tone and in a dignified way. The story, however, is not very different from some other Catholic traditions, and at anyrate it would occupy too much space to give it in her version. The substance is simply this: that one morning, a vast number of years ago, a beautiful ship, without sails or sailors, and with no cargo or passenger on board but a wooden image of the Virgin, came sailing into Boulogne; that the heaven-sent gift was reverently placed in the cathedral, where it received the adoration of the faithful, from far and near, for more than a thousand years, performing innumerable miracles in return; till at length the Revolution came, when the sacred image was burned to ashes—all but one hand, and the cathedral itself sold and ruined. Forty years after, the cathedral was raised anew by contributions from all countries, and was now on the eve of completion, when another image of the Virgin, but of stone, and of colossal proportions, was to be placed on the top of the edifice, so as to be visible from far at sea; and the inauguration was to take place of the re-establishment of pilgrimages to the shrine of

St Mary of Boulogne. This was to come off, Jeannette concluded, 'on the festival of the Assumption, which is the 15th of this month; and then such a spectacle will be seen in Boulogne as has never been witnessed yet. Everybody will walk in procession on the 30th—already the whole town are busy, each preparing for the part he is to perform.'

'And you, of course,' said I, 'have your part allotted you.'

'Yes, truly. What would you have? I am to be one of the choir of our parish: there will be two fifties of us, all dressed alike in white muslin, with gold coronals and veils descending to the knee. Will it not be charming?'

The voice of Madame R—— screaming for Jeannette at the foot of the stairs, prevented my reply, and the damsel tripped away.

On quitting the house after breakfast, I made towards the new cathedral, which, standing on the summit of a hill, towers over the whole town. In the Place d'Armes, I passed the covered statue of the Virgin, standing veiled on its pedestal, waiting for the day of inauguration. The cathedral is a lofty and magnificent building—and the door being open, and workmen passing in and out, I entered to look around; but though perfectly finished without, the interior is almost a waste, and I found a number of men engaged in the erection of what were evidently temporary fittings for a temporary purpose.

I had no difficulty in obtaining further information. Not only was every one aware of what was coming off, but a good number had, by some means or other, penetrated so far behind the scenes as to make themselves masters of the policy which guided the whole affair. From one informant, an Englishman, and of course a heretic, I learned a few private particulars. According to his shewing, the superb cathedral, reared with such painstaking piety by the good old Haffreingue, was terribly in debt, while yet a prodigious sum was wanting to complete the interior. In this dilemma the bishop of Arras had come forward and manfully put his shoulder to the wheel. He it was, and none other, who had boldly resolved to restore the pilgrimages to the shrine of Our Lady, calculating that from the offerings of the devoted pilgrims might be raised, if the affair were well managed, not only enough to clear the expenses past and prospective of the cathedral, but to maintain a permanent fund for the sustentation of the worship on a scale commensurate with the dignity of the church. And well indeed did the bishop manage the business. In the first place, he applied to the pope for the sanction and co-operation of his holiness; and meanwhile, nothing doubting the result, he commissioned the execution of a statue of the Virgin in stone, ten feet high, to stand on the summit of the edifice as a landmark and 'Star of the Sea.' Before raising it to its lofty elevation, he resolved to consecrate and bless the image, with the most imposing ceremonial, in the Place d'Armes, the very spot where the former image had been burned, and in the presence of such an assembly as for centuries had not been gathered within the walls of Boulogne.

The bishop was not deceived in his expectations from the pope. Pio Nono recommended the subject of the restoration of the pilgrimages to the shrine of Our Lady of Boulogne to his council of cardinals, and in

due time they unanimously issued a decree uniting Our Lady of Boulogne with Our Lady of Loretto—thereby securing to the former all the spiritual and intercessory favours and influences so long enjoyed by the latter. Moreover, by the same liberal decree, an indulgence is accorded, once in the year, to all faithful Christians who, confessing and doing penance, shall pray devoutly, according to the directions of the church, before the holy image of the immaculate Virgin—the pilgrims being at liberty to choose for their indulgence any day of the year that suits them best. But that was not all—the decree offers also a seven years' indulgence, extending over the whole period, to those who shall come to pray daily in the church, exercising due contrition for their faults. Further, the sacred pontiff gives a warranty with the indulgences, guaranteeing their applicability to souls in purgatory.

The conditions on which these spiritual advantages were to be won, it will be seen, are by no means hard; and the promulgators of the decree were right in calculating that they would be pretty widely accepted. If I had had any doubts on the subject, they would have been dissipated by the eagerness and excitement that prevailed among the population of the town—by the indications that met me on all sides of zealous preparations for the great event; and by the sudden going and coming of strangers from the provinces; and by the influx of flowers and tinsel, finery and greenery, which, as the time drew on, suddenly inundated the place.

The pilgrimages commenced on the appointed day, the 15th of August. The first bands of pilgrims arriving were from the parishes of the north nearest to Boulogne; these, for the most part, came on foot, or in such rustic conveyances as they had at command. They formed in procession as they entered the town—the acolytes of each parish, in red and white garb, leading the way, and bearing the crucifix in the van. Next came the ecclesiastics, singing canticles to the Virgin. Then came the groups of pilgrims proper, in some cases forming a rather motley show, consisting of both sexes and all ages and ranks—white-headed, tottering old men, sturdy grandmothers in high-peaked caps, peasant girls and lads, farmers, shopkeepers, with here and there a country gentleman with his wife and daughters—to these must be added the sober-looking figures of the Sisters of Charity, and the juvenile bands of pupils of the parochial schools. The above, however, constituted the humblest order of pilgrims; those who came from towns of any pretensions at all, cut a much more imposing figure: with a more numerous clergy, they had choirs of young-lady singers; they shone in gayer costumes, and carried embroidered banners brilliantly emblazoned. Such companies generally arrived by the railway, and many came from great distances. The party from Paris was the most pretentious and picturesque of all. Starting from the capital in the morning, it was nightfall when they reached Boulogne, and they had to make their procession by the light of hundreds of torches—and they presented a really striking spectacle. Led by a long train of ecclesiastics in splendid attire, and accompanied by a powerful choir of skilled metropolitan voices, they promenaded the Grande Rue under a series of triumphal arches formed of flowers and foliage. They were apparently all of the well-to-do class, and were clad in the current fashions of the day—the gentlemen blossoming in vests of delicate hue and pattern, and the ladies bare-browed, oyster-shell bonneted, and most expansive in crinolines.

Day after day, the parishes of the northern provinces poured in their pilgrims, and though numbers unavoidably departed almost as soon as they came, the town grew rapidly full to overflowing. As each band of pilgrims arrived at the cathedral, the gates were thrown open, the organ began to play, and

the choir in the gallery to sing—and the old Abbé Haffreingue, placing himself at the head of the newcomers, led them through the body of the church into a small chapel in the rear dedicated to Our Lady of Boulogne, and to the foot of the altar of the Virgin, which was surmounted by an image of Mary in her boat, gleaming in the light of many lamps around. Here the companies were formed into ranks, and kneeling, recited the petitions which mother-church had exacted as the price of the indulgences that were to follow. The prayers being at length finished, a white-robed priest glided along between the ranks, presenting to each suppliant an open money-box for the reception of the votive-offerings. The appeal was liberally responded to; the silver and the gold chinked plentifully in the dark receptacle; and there can be little doubt that during the fortnight these collections lasted, several thousands of pounds were thus silently and unostentatiously contributed to the treasury of the church.

I expected to grow weary of these endless flocks of pilgrims; but I did not, the reason perhaps being that the spectacle was one of continual variety, and the excitement it occasioned was contagious. No two of the processions were alike—each seemed to have some prominent peculiarity of its own—and in all of them there was a mingling of old-world faith and feeling with modern modes and customs, which, when it was not ridiculous, and perhaps even when it was, was often touchingly simple and suggestive. I ought to mention that while so large a provision was made for the spiritual necessity of the pilgrims, their bodily wants and their recreations had not been forgotten. Good eating and drinking seemed, and was the order of the day, and the commissariat of the town had not been neglectful. Further, by way of amusement, the Vauxhall of Boulogne, the Tintelleries' Gardens, consummated a gala every night—where a six hours' set-to at dancing, gallanting, and carousing, was crowned with a grand display of fireworks about the small hours preceding the dawn. This nocturnal excitement was found particularly convenient for those hand-to-mouth Christians of the pilgrimage, who, having an indulgence to act upon, hardly knew what to do with it, and therefore summarily squared the account at once, ere they departed to their homes, by taking an equivalent in a debauch in the gardens. An entertainment of a different kind attracted the more intellectual order of pilgrims. Every night, the church, which will hold four thousand auditors, was thrown open, and every night during these initiatory pilgrimages did the Abbé la Vigne, in a voice which resounded through the vast edifice, thunder his advocacy of the distinguishing doctrines of the Romish Church, and his denunciations against heresy and heretics. His fervid eloquence drew crowds to hear him, and the church was nightly filled—though a part of the attraction was perhaps due to the powers of a young monk who, during the performance of the mass which followed the discourse, poured forth tones exquisitely melodious, and manifested capacities as a vocalist probably unrivalled.

The last and grand day of the pilgrimages, which was expected to be, and was, the crowning climax of the whole, was Sunday, the 30th of August. The sun rose that morning in an unclouded sky—a cool breeze blew gently from the north-west over the ocean, and moderated the heats which had for a long time prevailed—the air was balmy and fragrant with the odours of myriads of flowers which everywhere met the eye. Six thousand persons in Boulogne spent the best hours of that morning at the toilet. Soon after the hour of noon had struck, they began to assemble in the streets, walks, and open places around the cathedral. There they were met by the priests, who, acting on a well-considered plan, arranged the several

portions of the vast procession, allotting to each individual his or her proper place in the cortège, according to a programme previously distributed. The head of the procession, which in a straight line would have measured a mile and a half in length, was stationed in the Place d'Armes, close to the now unveiled statue of the Virgin. This statue is a work of remarkable beauty, and worthy of all the encomiums that have been bestowed upon it, and is all too good to be exiled to a height where its wonderful merit will be lost to the observer. It stood beneath a magnificent canopy of flowers and foliage; and from this point, as the clock struck two, the van of the procession moved forwards, descending the hill towards the lower town. The procession consisted of two parts—the first being formed of the representatives of the seven parishes of Boulogne—and the second being made up of pilgrims from other parts, and including a number of dignified ecclesiastics who sanctioned the proceedings with their presence.

In the front, marched a detachment of the police, horse and foot, to clear the way. Of the several parishes, that of Portel took the lead. The *suisses*, very like an English beadle, only not so fat or so blue, but dazzling in scarlet and gold, stalked grandly, leading the acolytes who in their vests of open lace bore the crucifix on high. Then followed the companies of young maidens in fifties, clad in white, and veiled almost to the skirt, each with a transverse scarf on the shoulder. These, as they walked, burst into song, chanting sacred harmonies in praise of the Virgin Mother. A following band, no less beautifully clad, carried the white banner of the Immaculate Conception, and held in their hands lilies of gold. Then came a troop of maidens, bearing baskets of flowers; then the pupils of the parish-school in white garments, and bearing flags, banners, and streamers of all imaginable devices, and brilliant with blossoms and gilding. Then came a company of men loaded with huge banners on lofty poles, and reliquaries, and carved and gilded representations of some event in the life of Mary. These were followed by troops of children, with more flowers, ever-more flowers, flowers. Then a group of cultivators of the soil carried an image of the Virgin, and these were followed by a band of music. The whole seven parishes, linked together, extended for nearly a mile. Among them were the representatives of nearly every profession—the military in full dress, captains, colonels, and commanders—the magistracy and municipality, with the guilds of all the trades—the navy, the mercantile marine, and the humble fishermen of the coast—shopkeepers, craftsmen, artisans, and agriculturists—and religious orders of every grade and every colour, and in all varieties of costume. Of the young girls who figured in the procession, there could not be many short of two thousand, each of whom had been fitted out by her family at a cost which must have been far from trifling. Their sweet voices rang pleasantly in the Sabbath air, and, answered by the deep responses of the priests at a distance, produced an effect as novel as it was striking to the ear.

The second part of the procession, though less varied, was of even weightier significance. A company of English Catholic ladies led the way; and it is no libel to assert that their costume offered a singular contrast to the display of French taste and elegance which had gone before. They were followed by a band of Parisians of both sexes, dressed as Parisians always dress for a spectacle. The nuns and friars in serge and frieze came next. Sisters of Charity, Redemptorist Fathers, and an endless column of aboven priests, succeeded. Another band of maidens in white pressed on behind them, bearing presents to the Virgin, and a golden heart containing that famous relic, the old burned hand of the miraculous image, and flags,

banners, branches, and censers of smoking incense without number. Last of all came a reverend assembly of bishops, who, to the number of nine, brought up the rear. The Bishop of Arras marched first, with two tail-bearers, and with uplifted hand blessing the multitude as he went. Archbishop Cullen—the great Irish Newton—and a cardinal in red stockings, closed the account.

The procession, on the whole, was brilliant and splendid beyond my powers of description. At the pace at which it moved, it took an hour and a half to pass any particular point. As it wound its slow trail sometimes in contrary directions through its sinuous route, flashing and sparkling in the clear sunlight, it seemed an endless stream of life that would never pass away; anon, it was thrown into perspective, and then the whole mass seemed moving under a forest of silken banners, which the west wind curled with countless ripples. And ever the voices rose in solemn chant; and the bursts of plaintive music from the accompanying bands were borne upon the breeze.

But alas for the glory of the hour. *Finis coronat opus*, says the adage; but the finish here was anything but a worthy crown to the proceedings. It had been resolved that, on the return to the point of departure, the bishops and higher ecclesiastics should take post at the top of the Grande Rue, and unitedly bless the assembled multitude. A scaffolding and platform had been erected on the spot for the purpose. As the dignified personages returned from their long walk, not a little weary, each took his place on the platform. They were all assembled, bishops, archbishops, and cardinals, and were on the point of lifting their sacred hands to shed a benediction on the crowd below, when suddenly the platform on which they stood gave way with a terrible crash. Happily the planks had been covered with a stout carpet; and the carpet, being firmly lashed to the scaffolding poles, did not fall with the timber. The august prelates, instead of being dashed precipitately to the ground, were therefore only caught, as it were, in a blanket; but thus jumbled together in a mass, there was a sad surrender of ecclesiastical dignity. Bare heads knocking together, headless mitres and red caps, abandoned crosiers, red legs sticking upwards, and redder faces puffing for breath; and hands just stretched out to bless, now clutching desperately at the empty air—such was the spectacle that greeted the expectant multitude. What is remarkable is the fact, if it be a fact, which we received from a near by-stander—that the great Irish luminary, he who smashed the *Novum Organum*, in the midst of this right-reverend tussle, kept his footing, and retained it to the last. Whether his Milesian blood, which, as all the world knows, is in its element in the atmosphere of a scrimmage, stood him in good stead—or whether, not believing in gravitation, he did not choose to gravitate himself, this deponent sayeth not; he only says that his reverence from the sister-isle stood his ground when all else lay prostrate, and emerged from the blanket unscathed and unruffled. The worst of this mishap, however, was not the bodily injury sustained by their reverences, but the unfortunate twist which it gave to the conclusion of the fête, which was to have been so sublime. For the mob who had come to see the show were base enough to relish this part of it most of all. They broke out with a tremendous cheer—they laughed, they roared, they yelled madly with delight—they clapped their hands till they were sore, and bawled for an encore; and so the final blessing had to be administered on a safer footing, amidst all this merriment and din.

After the blessing of the people, came the blessing of the Virgin, which was followed by a sermon on the spot from the Bishop of Nevers; and the sermon was followed by a banquet given by the mayor, to which the dignified ecclesiastics were invited; and where, it

is to be hoped, they found consolation for the mishap of the afternoon. And thus endeth the history of the re-installation of the pilgrimages to Our Lady of Boulogne.

THE RYOT.

THE term 'ryot' signifies simply an agricultural labourer. Bengal contains eighty millions of inhabitants, of whom fully sixty millions are of this class: in other words, more than double the entire population of the United Kingdom are in this one presidency engaged in cultivating the soil. This will cease to be matter for astonishment when we remember that not only Bengal, but the whole of India is, strictly speaking, an agricultural country, where nineteen-twentieths of the exports are of raw produce. The amount of manufactured articles is most trifling; for although sugar, indigo, saltpetre, lac-dye, and other articles of produce undergo a certain manufacturing before being fit for the market, they do not come under the head of manufactures: they are but prepared vegetable products.

The condition of this large class of labourers, who really produce the great staples of Indian commerce, and are, in fact, the sinews and bone of the land, must be a subject of considerable importance at the present moment. Until Great Britain can arrive at a true appreciation of the position and interests of the many classes of her Indian subjects, it is scarcely possible for her to determine her future policy in regard to the country and those people.

The ryot is not merely an agricultural labourer: he is something more. He approaches more nearly to the Irish cottier in the nature of his tenure, though far below him in the abjectness of his poverty, in the hopelessness of his struggle with his fellow-man.

We must understand, then, that the ryot is neither more nor less than a farmer on a very minute scale: a small renter of a small fragment of land, sometimes equal to several acres in extent; at other times, but a few rods from boundary to boundary. The lands they hold under various tenures are in nearly all cases included in some zemindary or landed estate, the rights and privileges of which are put up for sale, just as any nobleman's estate may be in Great Britain.

It usually happens, however, that in every village in a zemindary, there are far more hands than are needed for cultivating the land upon it; at any rate, in the rough antique style of culture which they are in the habit of giving it. This surplussage of labour is often sought for in indigo or sugar districts at considerable trouble, and some cost; indeed, it often happens that the only mode by which village-labour can be secured, is by the purchase out and out of the zemindary. The people belong to the soil, rather than the soil to them; hence, the purchaser of the one acquires with them an ownership in the other. It constantly happens that when a European wishes to commence indigo-making, silk-rearing, or coal-mining, the only possible chance for his obtaining labour is to purchase a few villages, well stocked with able-bodied men and handy women. It is the possession by sale or lease of these populous villages which leads to so many affrays and downright battles in various parts of the Indian Mofussil, as to call for legislative interference.

During the government of Lord Cornwallis was perpetrated one of the greatest blunders of that or any other period: he completed what is known as the 'Permanent Settlement,' by which government, as owners of the soil, fixed for ever the rate at which the land should be assessed to the zemindars, irrespective of any improvement which might take place.

So far as the policy of this measure was concerned, it might have worked to much advantage; but, unfortunately for the real progress of the country, not a word was said in this famous settlement as to the rate at which the zemindars might assess the ryots on their land; at the same time, the most arbitrary and summary powers were given the former, to enable them to enforce their demands against their unfortunate tenants. It is quite true that the act of settlement provided that an assessment, once made, could not be altered by any zemindar or other landholder—with only one exception, which was on the occasion of an estate changing proprietors. This one exception was quite sufficient for all purposes of extortion. If a zemindar wishes to raise the assessment of his land, he has but to make a pretended sale to some friend or relative, and the screw is at once put on, and, as a matter of course, submitted to; for who has ever heard of a ryot opposing the will of his zemindar? Sometimes, indeed, the labourer will be too poor, or too broken-spirited to work on at a higher rate, in which case he will be at once ejected, to wander homeless and hopeless, with no relief but such scanty charity as neighbours may care to dole out to him.

It is not merely in this way that the labouring population of Hindostan are placed at the mercy of a grasping, relentless race of men. Between the great zemindar and the people there is a little army of middlemen, the devourers of other men's substance, who act sometimes as his agents or bailiffs, sometimes as sub-renters, who take the trouble off his hands for a round sum for the year. In these cases, the extortions are generally doubled, for the farmer of the rents for the time being cares far less for the welfare of the ryots on the land than the zemindar. It is difficult for any one who has not resided for some time amongst an agricultural population in British India, to form a right conception of the exactions to which they are exposed, and the utter impossibility of escape for them under the present administration of the laws. The renter has not a want in his household that the villagers are not compelled to supply. Every article of daily consumption—rice, oil, milk, ghee, cotton—all must be found him by the ryots of his district. How heavily this presses upon the half-fed, half-clad people, only those can say who know their utter poverty.

The advocates of the present system, and amongst these are to be found many Europeans, maintain that the Indian ryot is a poor degraded creature, incapable of better things, unfit for progress, and reckless of the future. Alas! he has never had a trial, under British rule, of what he is capable, nor of what he might be under a better system. We are not among those who predict a rapid advance of civilisation amongst any Asiatic race, much less amongst the Hindoos, but we believe they might be made a prosperous and thriving people if the whole race of zemindars, putindars, and other middlemen were swept from the face of the land, and the ryots left in possession of the fruit of their daily toil.

Wherever European capital has been introduced throughout the Mofussil, and brought in contact with the village population, there a marked improvement is to be seen in their condition. A good deal has been said about the oppression of English indigo-planters: possibly some part of the statements may be correct, but the tyranny of a European is mercy beside the moderation of a Bengalee landholder. Many a hard bargain is doubtless driven by the planter with his ryots, but no one supposes him capable of the cruelties practised by the native renters, to wring the last copper pice or cowrie from the helpless dependent.

In India, proof of guilt is at all times difficult to obtain, but doubly so against the wealthy; yet evidence has not been wanting of the most barbarous tortures inflicted by zemindars of the soil upon their dependents,

even to the death, and that, too, for not more than copper coin—a few annas only, less than a sixpence due upon a balance of rent. So much is this the system amongst natives of Bengal, that we much doubt whether there be any zemindary in which torture is not employed in the collection of rents. We must not wonder at this, for Bengalees are proverbially cowards, and all cowards are cruel—and who such promising victims as the poor ryots?

There is no physical wretchedness nor abject misery within European limits that can in any way compare with the utter prostration and broken-down degradation of the great bulk of the Bengal ryots. The land how fertile, the climate how favourable, the rivers and canals how enriching for the production of the finest silks, the richest dyes, the most delicate fibres, the most valuable grain that nature has ever enabled man to produce for the markets of the world; and yet, amidst all this abundance of blessings, how miserable the condition of those who should be sharers in the general wealth! A stranger in the land might well mistake an ordinary ryot, in his pristine rags, and dirt, and squalor, for some wandering outcast from a jail, a hospital, or a lunatic asylum.

The oriental, of whatever grade, or caste, or calling, has an instinctive love for landed property. If it be but the most miserable corner of the poorest holding, the most wretched hovel that man could take shelter in, the Asiatic is still most anxious to be considered as the owner. It may be that the Indian tenant-farmer dwells in a place that might in Europe be deemed fit only for dogs; it may be that on the limited slip of soil encircling his hovel, a sickly mango-tree, a few date-palms, a cluster of plantains, or a knot of sugar-cane, may be seen; it may be that cultivated fields grace the environs in rich luxuriance; but be this as it may, the owner or renter is equally delighted, so that he may feel that he is the possessor of the homestead, the garden, or the field.

Of course, there are many grades of ryots, all differing as much in their material position as in their habits and inclinations. Besides the mere renter or the day-labourer, there are men who, holding no land of their own, yet possess a pair of bullocks, a plough, and a *kodahie* or hoe, with which they undertake to plant and tend the land of others, who are either too idle or too busy to cultivate it themselves, receiving half of the produce for so doing. There are, besides these, many others who hold land either as members of a family in common, or in their individual right, and who hold some appointment or office, whilst they leave others to cultivate for them, receiving, of course, their share of crops. It is scarcely too much to say, perhaps, that in Bengal, if not in the upper provinces, there are very few Hindoos, and not many Mussulmans, who have not a holding of some sort.

It would not interest the general reader to be told at what rate per *beegah* the generality of these tenures are held, nor to hear how the holdings vary in different parts of the country; it may, however, be stated, that the ryot who holds a *jumma* or tenure equal to fifty rupees per annum, is supposed to be in a tolerably good position. When he has paid his rent, his *abwabs* or presents, his fees to village *chowkedars* or watchmen, the interest on borrowed money, the value of his seed, repairs of tools, &c., he may have perhaps twenty rupees left for his year's family expenses, being about one penny a day.

It is true, his wants are few in number compared with those of a European labourer; but if he have more than one child, the above small sum cannot go far to supply his household wants. The article of clothing is indeed almost a superfluity; their cooking utensils, a few earthen vessels and wooden implements, value not above a few pice; his agricultural tools, plough,

barrow, and hoe, such as they are, of the pattern of the first Pharaohs and Nimrod, may be worth about three rupees, and perhaps cost him a shilling during the year for repairs. As for dress, the slips of dirty cloth about his and his wife's waist are scarcely worthy the name; their value cannot be more than a few pence.

What shall we say of his food? Surely he who tills the ground, who rears the bread of millions, cannot want a sufficiency of food. The ryot does not really starve, save in very extreme cases, but he feeds on the merest pittance of the poorest grain and vegetables. Rice is a luxury in many cases: parched grain, millet, and the smaller fish of tanks and streams, with vegetables and roots, make up the ordinary meals of these people. It must be remembered, however, that we speak only of the professional ryot; and even amongst these there are remarkable exceptions of successful industry and agricultural prosperity: these are mostly to be met with near the larger towns and cities; but the bulk of the population must not be judged from them.

In the Mofussil of India, one great want is that of roads. Away from the influence of rivers, the tiller of the soil finds it all but impossible to convey his produce to distant marts. Hence arise those fearful famines which have at frequent intervals desolated the land. One district with a failure of grain-crops lacks food, another province commands an abundance of rice; yet, without roads, how can the two effect any exchange. In this way, even in ordinary times, a superabundant crop has so glutted the local market, as to reduce the value of grain to the merest trifle—so low as to be unequal to the amount of rent and charges on the land, thus making a curse of a blessing. Rice has been known to fall to one rupee the hundred *seers*, or one shilling for a hundred pounds-weight; while a hundred miles away it was selling at four and five times that price; yet the owners of the cheap rice could not sell it to the buyers of dear grain, simply because the cost and difficulty of transport was so great.

The railway, it is clear, will prove one of the greatest boons to India. With it, famines will be all but impossible, and the fruit of labour on the soil far more certain. We are not amongst those who augur rapid changes and complete reformation amongst the natives of India, from the consequences of recent events, from what is termed the Anglicising of British India. But, on the other hand, we do firmly believe in a gradual and lasting improvement, not by legislative enactments, nor Orders in Council, but by many concurrent means—by the gradual enlightenment of the mass of the people; by the spread of vernacular education through village-schools, thus teaching the ryot what will in time lift him above his present misery, and take him out of the hands of the *mahajun* and the usurer; by the introduction of better implements, and a better system of agriculture; by a better, a more honest police; by railways and cart-roads helping to bring remote places near, and rendering the value of produce in different districts more equal, and less liable to sudden and disastrous convulsions; above all, by the gradual spread of Christianity, and with it the rooting out of the old leaven of heathenism, with all its accompanying social evils. We are careful to speak of this as a *gradual* change: those who look for anything like rapid progression will be disappointed. The work of a thousand years cannot be undone in one, nor in ten. As well might we attempt to bleach their skins.

It should not be assumed from what we have here written that we consider *all* ryots as impoverished and oppressed, and fitting objects of compassion. We are well aware of the vicious character of many village communities, of their obstinate idleness, and their

combined opposition to every lawful authority. As for extravagance on particular occasions, such as a marriage, leaving the ryot in debt for years to come, perhaps for a lifetime, that folly can scarcely be spoken of as exceptional; it is unfortunately the rule amongst both good and bad, high and low. The Hindoo indifference to all improvement is likewise not the less general. An Asiatic is from habit opposed to any expenditure of labour that does not yield a speedy return, or lead to some immediate perceptible good. These are amongst the most prominent of the ryot's defects, shared in by other classes of the Indian community, but more keenly felt in his own case from the general abjectness of his social position.

OCEOLA:

A ROMANCE.

CHAPTER XXXI.—THE TRAITOR CHIEFS.

SOON after, I retired from the mess-table, and strolled out into the stockade.

It was now after sunset. Orders had been issued for no one to leave the fort; but, translating these as only applicable to the common soldier, I resolved to sally forth.

I was guided by an impulse of the heart. In the Indian camp were the wives of the chiefs and warriors—their sisters and children—why not she among the rest?

I had a belief that she was there—although, during all that day, my eyes had been wandering in vain search. She was not among those who had crowded around the council: not a face had escaped my scrutiny.

I resolved to seek the Seminole camp—to go among the tents of the Micosauc—there, in all likelihood, I should find Powell—there I should meet with Maimee.

There would be no danger in entering the Indian camp—even the hostile chiefs were yet in relations of friendship with us; and surely Powell was still my friend? He could protect me from peril or insults.

I felt a longing, to grasp the hand of the young warrior, that of itself would have influenced me to seek the interview. I yearned to renew the friendly confidence of the past—to talk over those pleasant times—to recall those scenes of halcyon brightness. Surely the sterner duties of the chief and war-leader had not yet indurated a heart, once mild and amiable? No doubt the spirit of my former friend was imbibed by the white man's injustice; no doubt I should find him rancorous against our race; he had reason—still I had no fears that I myself was not an exception to this wholesale resentment.

Whatever the result, I resolved to seek him, and once more extend to him the hand of friendship.

I was on the eve of setting forth, when a summons from the commander-in-chief called me to his quarters. With some chagrin, I obeyed the order.

I found the commissioner there, with the officers of higher rank—the Ringolds and several other civilians of distinction.

On entering, I perceived that they were in 'caucus,' and had just ended the discussion of some plan of procedure.

'The design is excellent,' observed General Clinch, addressing himself to the others; 'but how are Omata and "Black Dirt" to be met? If we summon them hither, it may create suspicion: they could not enter the fort without being observed.'

'General Clinch,' said the elder Ringold—the most cunning diplomatist of the party—'if you and

* So Lusta Hajo was called by the Americans. His full name was Fuchta-Lusta-Hajo, which signifies 'Black Crazy Clay.'

General Thompson were to meet the friendly chiefs outside?—

'Exactly so,' interrupted the commissioner. 'I have been thinking of that. I have sent a messenger to Omatla, to inquire if he can give us a secret meeting. It will be best to see them outside. The man has returned—I hear him.'

At this moment, a person entered the room, whom I recognised as one of the interpreters who had officiated at the council. He whispered something to the commissioner, and then withdrew.

'All right, gentlemen!' exclaimed the latter, as the interpreter went out; 'Omatla will meet us within the hour. Black Dirt will be with him. They have named the "Sink" as the place. It lies to the north of the fort. We can reach it without passing the camp, and there will be no risk of our being observed. Shall we go, general?'

'I am ready,' replied Clinch, taking up his cloak, and throwing it over his shoulders; 'but, General Thompson,' said he, turning to the commissioner, 'how about your interpreters? Can they be intrusted with a secret of so much importance?'

The commissioner appeared to hesitate.

'It might be imprudent,' he replied at length, in a half-soliloquy.

'Never mind then—never mind,' said Clinch; 'I think we can do without them. Lieutenant Randolph,' continued he, turning to me, 'you speak the Seminole tongue fluently?'

'Not fluently, general; I speak it, however.'

'You could interpret it fairly.'

'Yes, general; I believe so.'

'Very well then; that will do. Come with us!'

Smothering my vexation, at being thus diverted from my design, I followed in silence—the commissioner leading the way, while the general, disguised in cloak and plain forage-cap, walked by his side.

We passed out of the gate, and turned northward around the stockade. The tents of the Indians were upon the south-west, placed irregularly along the edge of a broad belt of 'hommocky' woods that extended in that direction. Another tract of hommock lay to the north, separated from the larger one by savannas and open forests of pine-timber. Here was the 'Sink.' It was nearly half a mile distant from the stockade; but in the darkness we could easily reach it without being observed from any part of the Seminole camp.

We soon arrived upon the ground. The chiefs were before us. We found them standing under the shadows of the trees by the edge of the pond.

My duty now began. I had little anticipation that it was to have been so disagreeable.

'Ask Omatla what is the number of his people—also those of Black Dirt, and the other chiefs who are for us.'

I put the question as commanded.

'One-third of the whole Seminole nation,' was the ready reply.

'Tell them that ten thousand dollars shall be given to the friendly chiefs, on their arrival in the west, to be shared among them as they deem best—that this sum is independent of the appropriation to the whole tribe.'

'It is good,' simultaneously grunted the chiefs, when the proposition was explained to them.

'Does Omatla and his friends think, that all the chiefs will be present to-morrow?'

'No—not all.'

'Which of them are likely to be absent?'

'The mico-mico will not be there.'

'Ha! Is Omatla sure of that?'

'Sure. Onopa's tents are struck: he has already left the ground.'

'Whither has he gone?'

'Back to his town.'

'And his people?'

'Most of them gone with him.'

For some moments the two generals communicated together in a half-whisper. They were apart from me: I did not hear what they said. The information just acquired was of great importance, and seemed not to disconcert them.

'Any other chief likely to be absent to-morrow?' they asked, after a pause.

'Only those of the tribe of "redsticks."'

'Hoitle-mattee?'

'No—he is here—he will remain.'

'Ask them if they think *Ogeola* will be at the council to-morrow.'

From the eagerness with which the answer was expected, I could perceive that this was the most interesting question of all. I put it directly.

'What!' exclaimed the chiefs, as if astonished at the interrogatory. 'The Rising Sun! He is sure to be present: he will see it out!'

'Good!' involuntarily ejaculated the commissioner, and then turning to the general, he once more addressed him in a low tone. This time, I overheard what passed between them.

'It seems, general, as if Providence was playing into our hands. My plan is almost sure to succeed. A word will provoke the impudent rascal to some rudeness—perhaps worse—at all events, I shall easily find a pretext for shutting him up. Now that Onopa has drawn off his following, we will be strong enough for any contingency. The hostiles will scarcely outnumber the friendlies, so that there will be no chance of the rascals making resistance.'

'Oh! that we need not fear.'

'Well—with him once in our power, the opposition will be crushed—the rest will yield easily—for, beyond doubt, it is he that now intimidates and hinders them from signing.'

'True,' replied Clinch in a reflective tone; 'but how about the government, eh? Will it endorse the act, think you?'

'It will—it must—my latest dispatch from the President almost suggests as much. If you agree to act, I shall take the risk.'

'Oh, I place myself under your orders,' replied the commander-in-chief, evidently inclined to the commissioner's views, but still not willing to share the responsibility. 'It is but my duty to carry out the will of the executive. I am ready to co-operate with you.'

'Enough then—it shall be done as we have designed it. Ask the chiefs,' continued the speaker addressing himself to me, 'ask them, if they have any fear of signing to-morrow.'

'No—not of the signing, but afterwards.'

'And what afterwards?'

'They dread an attack from the hostile party—their lives will be in danger.'

'What would they have us do?'

'Omatla says, if you will permit him and the other head-chiefs to go on a visit to their friends at Tallahassee, it will keep them out of danger. They can stay there till the removal is about to take place. They give their promise that they will meet you at Tampa, or elsewhere, whenever you summon them.'

The two generals consulted together—once more in whispers. This unexpected proposal required consideration.

Omatla added:

'If we are not allowed to go to Tallahassee, we

* A name given to the Miccosauca, from their custom of setting up red poles in front of their houses when going to war. A similar custom exists among other tribes; hence the name 'Racon rouge,' applied by the French colonists.

cannot, we dare not, stay at home; we must come under the protection of the fort."

"About your going to Tallahassee, replied the commissioner, 'we shall consider it, and give you an answer to-morrow. Meanwhile, you need not be under any apprehension. This is the war-chief of the whites; he will protect you.'

"Yes," said Clinch, drawing himself proudly up. "My warriors are numerous and strong. There are many in the fort, and many more on the way. You have nothing to fear."

"It is good!" rejoined the chiefs. "If troubles arise, we shall seek your protection; you have promised it—it is good."

"Ask the chiefs," said the commissioner, to whom a new question had suggested itself—"ask them if they know whether Holata Mico will remain for the council of to-morrow?"

"We cannot tell now. Holata Mico has not declared his intention. We shall soon know it. If he design to stay, his tents will stand till the rising of the sun; if not, they will be struck before the moon goes down. The moon is sinking—we shall soon know whether Holata Mico will go or stay."

"The tents of this chief are not within sight of the fort?"

"No—they are back among the trees."

"Can you send word to us?"

"Yes, but only to this place; our messenger would be seen entering the fort. We can come back here ourselves, and meet one from you."

"True—it is better so," replied the commissioner, apparently pleased with the arrangement.

A few minutes passed, during which the two generals communicated with each other in whispers, while the chiefs stood apart, silent and immobile as a pair of statues.

The commander-in-chief at length broke silence:

"Lieutenant! you will remain upon the ground till the chiefs return. Get their report, and bring it direct to my quarters."

Salutations were exchanged; the two generals walked off on the path that led to the fort, while the chiefs glided silently away in the opposite direction. I was left alone.

CHAPTER XXXII.

SHADOWS IN THE WATER.

Alone with my thoughts, and these tainted with considerable acerbity. More than one cause contributed to their bitterness. My pleasant purpose thwarted—my heart aching for knowledge—for a renewal of tender ties—distracted with doubts—wearied with protracted suspense.

In addition to these, my mind was harassed by other emotions. I experienced disgust at the part I had been playing. I had been made the mouthpiece of chicanery and wrong; aiding conspiracy had been the first act of my warlike career; and although it was not the act of my own will, I felt the disagreeableness of the duty—a sheer disgust in its performance.

Even the loveliness of the night failed to soothe me. Its effect was contrary: a storm would have been more congenial to my spirit.

And it was a lovely night. Both the earth and the air were at peace.

Here and there, the sky was fleeced with white cirrhi, but so thinly, that the moon's disk, passing behind them, appeared to move under a transparent gauze-work of silver, without losing one ray of her effulgence. Her light was resplendent in the extreme; and, glancing from the glabrous leaves of the great laurels, caused the forest to sparkle, as though beset with a million of mirrors. To add to the effect, fire-

flies swarmed under the shadows of the trees, their bodies lighting up the dark aisles with a mingled coruscation of red, blue, and gold—now flitting in a direct line, now curving, or waving upward and downward, as though moving through the mazes of some intricate *cotillon*.

In the midst of this glittering array, lay the little tarn, shining, too, but with the gleam of plated glass—a mirror in its framework of fretted gold.

The atmosphere was redolent of the most agreeable perfumes. The night was cool enough for human comfort, but not chill. Many of the flowers refused to close their corollas—for not all of them were brides of the sun. The moon had its share of their sweets. The sassafras and bay trees were in blossom, and dispensed their odours around, that, mingling with the aroma of the aniseed and orange, created a delicious fragrance in the air.

There was stillness in the atmosphere, but not silence. It is never silent in the southern forest by night. Tree-frogs and cicadas utter their shrillest notes after the sun has gone out of sight, and there is a bird that makes choice melody during the moonlight hours—the famed mimic of the American woods. One, perched upon a tall tree that grew over the edge of the pond, appeared trying to soothe my chafed spirit with his sweet notes.

I heard other sounds—the hum of the soldiery in the fort, mingling with the more distant noises from the Indian camp. Now and then some voice louder than the rest, in oath, exclamation, or laughter, broke forth to interrupt the monotonous murmur.

How long should I have to wait the return of the chiefs? It might be an hour, or two hours, or more? I had a partial guide in the moon. They said that Holata would depart before the shining orb went down, or not at all. About two hours, then, would decide the point, and set me free.

I had been standing for half the day. I cared not to keep my feet any longer; and, choosing a fragment of rock near the water's edge, I sat down upon it.

My eyes wandered over the pond. Half of its surface lay in shadow; the other half was silvered by the moonbeams, that, penetrating the pellucid water, rendered visible the white shells and shining pebbles at the bottom. Along the line where the light and darkness met, were outlined several noble palms, whose tall stems and crested crowns appeared stretching away towards the nadir of the earth—as though they belonged to another and brighter firmament beneath my feet. The trees, of which these were but the illusory images, grew upon the summit of a ridge, which, trending along the western side of the pond, intercepted the rays of the moon.

I sat for some time gazing into this counterpart of heaven's canopy, with my eyes mechanically tracing the great fan-like fronds.

All at once, I was startled at perceiving a new image upon the aqueous reflector. A form, or rather the shadow of one, suddenly appeared among the trunks of the palms. It was upright, and evidently human, though of magnified proportions—beyond doubt, a human figure, yet not that of a man.

The small head, apparently uncovered, the gentle rounding of the shoulders, the soft undulation of the waist, and the long, loose draping which reached nearly to the ground, convinced me that the shadow was that of a woman.

When I first observed it, it was moving among the stems of the palm-trees; presently it stopped, and for some seconds remained in a fixed attitude. It was then I noted the peculiarities that distinguish the sex.

My first impulse was to turn round, and, if possible, get sight of the figure that cast this interesting

shadow. I was myself on the western edge of the pond, and the ridge was behind me. Facing round, I could not see the summit nor yet the palms. Rising to my feet, I still could not see them: a large live oak, under which I had seated myself, intercepting my view.

I stepped hastily to one side, and then both the outline of the ridge and the palm-trees were before my eyes; but I could see no figure, neither of man nor woman.

I scanned the summit carefully, but no living thing was there; some fronds of the saw-palmetto, standing along the crest, were the only forms I could perceive.

I returned to where I had been seated; and, placing myself as before, again looked upon the water. The palm shadows were there, just as I had left them; but the image was gone.

There was nothing to be astonished at. I did not for a moment believe myself under any delusion. Some one had been upon the ridge—a woman, I supposed—and had passed down under the cover of the trees. This was the natural explanation of what I had seen, and of course contented me.

At the same time, the silent apparition could not fail to arouse my curiosity; and instead of remaining seated, and giving way to dreamy reflections, I rose to my feet, and stood looking and listening with eager expectation.

Who could the woman be? An Indian, of course. It was not probable that a white woman should be in such a place, and at such an hour. Even the peculiar outlines of the shadow were not those that would have been cast, by one habited in the garb of civilisation: beyond a doubt, the woman was an Indian.

What was she doing in that solitary place, and alone?

These questions were not so easily answered; and yet there was nothing so remarkable about her presence upon the spot. To the children of the forest, time is not as with us. The hours of the night are as those of the day—often the hours of action or enjoyment. She might have many a purpose in being there. She might be on her way to the pond for water—to take a bath; or it might be some impassioned maiden, who, under the secret shadows of this secluded grove, was keeping assignation with her lover.

A pang, like a poisoned arrow, passed through my heart: '*Might it be Maimee?*'

The unpleasantness which this conjecture caused me is indescribable. I had been all day the victim of dire suspicions, arising principally from some half-dozen words, casually dropped from the lips of a young officer, and which I had chanced to overhear. They had reference to a beautiful girl among the Indians, apparently well known at the fort; and I noticed that the tone of the young fellow was that of one either triumphant or boasting. I listened attentively to every word, and watched not only the countenance of the speaker, but those of his auditory—to make out in which of the two categories I should place him. His vanity appeared to have had some sacrifice made to it—at least by his own statement; and his listeners, or most of them, agreed to concede to him the happiness of a *bonne fortune*. There was no name given—no hint that would enable me to connect the subject of the conversation with that of my own thoughts; but that the girl was an Indian, and a 'beauty,' were points, that my jealous heart almost accepted as sufficient for identification.

I might easily have become satisfied. A word, a simple question, would have procured me the knowledge I longed for; and yet I dared not say that word. I preferred passing long hours—a whole day—upon the rack of uncertainty and suspicion.

Thus, then, was I prepared for the painful con-

jectures that sprang into my thoughts on beholding that mirrored form.

The pain was of short duration; almost instantaneous was the relief. A shadowy figure was seen gliding around the edge of the pond; it emerged into the open moonlight, not six paces from where I stood. I had a full and distinct view of it. It was a woman—an Indian woman. It was *not* Maimee.

CHAPTER XXXIII.

HAJ-EWA.

I saw before me a woman of middle age—somewhere between thirty and forty—a large woman, who once possessed beauty—beauty that had been abused. She was the wreck of a grand loveliness, whose outlines could not be effaced—like the statue of some Grecian goddess, broken by Vandal hands, but whose very fragments are things of priceless value.

Not that her charms had departed. There are men who affect to admire this ripe maturity; to them, she would have been a thing of peerless splendour. Time had made no inroad upon those large rounded arms, none upon the elliptical outlines of that noble bust. I could judge of this—for it was before my eyes, in the bright moonlight, nude, from neck to waist, as in the hour of infancy. Alone the black hair, hanging in wild dishevelment over the shoulders, formed a partial shrouding. Nor had time laid a finger upon this: amidst all that profusion of rich raven clusters, not a strand of silver could be detected.

Time could not affect, nor had it, that fine facial outline. The moulding of the chin; the oval of those lips; the aquiline nose, with its delicate spirally curved nostril; the high, smooth front; the eye—the eye—what is it? why that unearthly flash? that wild unmeaning glance? Ha! that eye—Merciful heavens! *the woman is mad!*

Alas! it was true—she was mad. Her glance would have satisfied even a casual observer, that reason was no longer upon its throne. But I needed not to look at her eye; I knew the story of her misfortunes, of her wrongs. It was not the first time I had looked upon that womanly form—more than once I had stood face to face with Haj-Ewa,* the mad queen of the Micosauca.

Beautiful as she was, I might have felt fear at her presence—still worse than fear, I might have been terrified or awed—the more so on perceiving that her necklace was a green serpent; that the girdle around her waist, that glittered so conspicuously in the light of the moon, was the body of an enormous rattlesnake, living and writhing!

Yes, both were alive—the smaller serpent wound about her neck, with its head resting upon her bosom; the more dangerous reptile knotted around her waist, its vertebrated tail hanging by her side, while its head, held in her hand, and protruding through her fingers, exhibited a pair of eyes that scintillated like diamonds.

On the head of Haj-Ewa was no other covering than that which nature had provided for it; but those thick black clusters afforded ample protection against sun and storm. On her feet she wore moccasins, but these were hidden by the long 'hunna' that reached to the ground. This was the only garment she wore. It was profusely adorned with beads and embroidery—with the bright plumage of the green parrot—the skin of the summer-duck, and the fur of various wild animals. It was fastened round her waist, though not by the girdle already described.

* Literally, 'crazy wife,' from *Hajo*, crazy, and *Ewa* or *Awah*, wife. Philologists have remarked the resemblance of this Muscogee word to the Hebraic name of the mother of mankind.

Truly, I might have felt terror, had this singular appearance been new to me. But I had seen all before—the green snake, and the *crotalus*, the long hanging tresses, the wild flash of that maniac eye—all before, all harmless, all innocuous—at least to me. I knew it, and had no fear.

'Haj-Ewa!' I called out, as she advanced to where I was standing.

'I-e-ela!'* exclaimed she with a show of surprise. 'Young Randolph! war-chief among the pale faces! You have not then forgotten poor Haj-Ewa?'

'No, Ewa, I have not. What seek you here?'

'Yourself, little mico.'

'Seek me?'

'No—I have found you.'

'And what want you with me?'

'Only to save your life—your young life, pretty mico—your fair life—your precious life—ah! precious to her, poor bird of the forest! Ah! there was one precious to me—long, long ago. Ho, ho, ho!

O why did I trust in a pale-faced lover?

Ho, ho, ho!

Why did I meet him in the wild woods' cover?

Ho, ho, ho!

Why did I list to his lying tongue,

That poisoned my heart when my life was young?

Ho, ho, ho!

'Down, *chitta mico*!'† she cried, interrupting the strain, and addressing herself to the rattlesnake, that at my presence had protruded his head, and was making demonstrations of rage—'down, great king of the serpents! 'tis a friend, though in the garb of an enemy—quiet, or I crush your head!'

'I-e-ela!' she exclaimed again, as if struck by some new thought; 'I waste time with my old songs; he is gone, he is gone! they cannot bring him back. Now, young mico, what came I for? what came I for?'

As she uttered these interrogatives, she raised her hand to her head, as if to assist her memory.

'Oh! now I remember. *Hahuk*!‡ I lose time. You may be killed, young mico—you may be killed, and then—Go! begone, begone, begone! back to the topekee.¶ Shut yourself up; keep among your people: do not stray from your blue soldiers; do not wander in the woods! Your life is in danger.'

All this was spoken in a tone of earnestness that astonished me. More than astonished, I began to feel some alight alarm, since I had not forgotten the attempted assassination of yesterday. Moreover, I knew that there were periods when this singular woman was not positively insane. She had her lucid intervals, during which she both talked and acted rationally, and often with extraordinary intelligence. This might be one of those intervals. She might be privy to some scheme against my life, and had come, as she alleged, to defeat it.

But who was my enemy or enemies? and how could she have known of their design?

In order to ascertain this, I said to her:

'I have no enemy, Ewa; why should my life be in danger?'

'I tell you, pretty mico, it is—you have enemies. I-e-ela! you do not know it?'

'I never wronged a red man in my life.'

'Red—did I say red man? *Cooree*,¶ pretty Randolph, there is not a red man in all the land of the Seminoles that would pluck a hair from your head. Oh! if they did, what would say the Rising

Sun? He would consume them like a forest fire. Fear not the red men—your enemies are not of that colour.'

'Ha! not red men? What, then?'

'Some white—some yellow.'

'Nonsense, Ewa! I have never given a white man cause to be my enemy.'

'*Chepawnee*!‡ you are but a young fawn, whose mother has not told it of the savage beasts that roam the forest. There are wicked men who are enemies without a cause. There are some who seek your life, though you never did them wrong.'

'But who are they? And for what reason?'

'Do not ask, *chepawnee*! There is not time. Enough if I tell you, you are owner of a rich plantation, where black men make the blue dye. You have a fair sister—very fair. Is she not like a beam from yonder moon? And I was fair once—so he said—Ah! it is bad to be beautiful. Ho, ho, ho!

Why did I trust in a pale-faced lover?

Ho, ho, ho!

Why did I meet him—

'*Hahuk*!' she exclaimed, again suddenly breaking off the strain: 'I am mad; but I remember. Go! begone! I tell you, go: you are but an *achokee*,† and the hunters are upon your trail. Back to the topekee—go! go!'

'I cannot, Ewa; I am here for a purpose; I must remain till some one comes.'

'Till some one comes! *hahuk*! they will come soon.'

'Who?'

'Your enemies—they who would kill you; and then the pretty dee will bleed—her poor heart will bleed: she will go mad—she will be like Haj-Ewa.'

'Whom do you speak of?'

'Of—Hush! hush! hush! It is too late—they come—they come! see their shadows upon the water!'

I looked, as Haj-Ewa pointed. Sure enough there were shadows upon the pond, just where I had seen hers. They were the figures of men—four of them. They were moving among the palm-trees, and along the ridge.

In a few seconds, the shadows disappeared. They who had been causing them had descended the slope, and entered among the timber.

'It is too late now,' whispered the maniac, evidently at that moment in full possession of her intellect. 'You dare not go out into the open woods. They would see you—you must stay in the thicket. There!' continued she, grasping me by the wrist, and, with a powerful jerk, bringing me close to the trunk of the live oak: 'this is your only chance. Quick—ascend! Conceal yourself among the moss. Be silent—stir not till I return. *Htakias*!‡'

And so saying, my strange counsellor stepped back under the shadow of the tree; and, gliding into the umbrageous covert of the grove, disappeared from my sight.

I had followed her directions, and was now ensconced upon one of the great limbs of the live oak—perfectly hidden from the eyes of any one below by festoons of the silvery *tillandsia*. These, hanging from branches still higher up, draped around me like a set of gauze curtains, and completely enveloped my whole body; while I myself had a view of the pond—at least, that side of it on which the moon was shining—by means of a small opening between the leaves.

At first I fancied I was playing a very ridiculous *réle*. The story about enemies, and my life being in danger, might, after all, be nothing more than some crazy fancy of the poor maniac's brain. The men, whose shadows

* An expression of astonishment, usually lengthened out in a sort of drawl.

† Literally, Yes, yes, yes!

‡ 'Chief of the snakes'—the rattlesnake is so styled by the Seminoles, being the most remarkable serpent in their country. They have a superstitious dread of this reptile.

§ It is bad.

¶ Fort.

‡ No.

* Boy.

+ Fawn.

: It is good—it is well.

I had seen, might be the chiefs on their return. They would reach the ground where I had appointed to meet them, and not finding me there, would go back. What kind of report should I carry to headquarters? The thing was ridiculous enough—and for me, the result might be worse than ridiculous.

Under these reflections, I felt strongly inclined to descend, and meet the men—whoever they might be—face to face.

Other reflections, however, hindered me. The chiefs were only *two*—there were *four* shadows. True, the chiefs might be accompanied by some of their followers—for better security to themselves on such a traitorous mission—but I had noticed, as the shadows were passing over the pond—and notwithstanding the rapidity with which they moved—that the figures were not *those of Indians*. I observed no hanging drapery, nor plumes. On the contrary, I fancied there were *hats* upon their heads, such as are worn only by white men. It was the observation of this peculiarity that made me so ready to yield obedience to the solicitations of Haj-Ewa.

Other circumstances had not failed to impress me: the strange assertions made by the Indian woman—her knowledge of events, and the odd allusions to well-known persons—the affair of yesterday: all these, commingling in my mind, had the effect of determining me to remain upon my perch, at least for some minutes longer. I might be relieved from my unpleasant position sooner than I expected.

Without motion, almost without breathing, I kept my seat, my eyes carefully watching, and ears keenly bent to catch every sound.

My suspense was brief. The acuteness of my eyes was rewarded by a sight, and my ears by a tale, that caused my flesh to creep, and the blood to run cold in my veins. In five minutes' time, I was inducted into a belief in the wickedness of the human heart, exceeding in enormity all that I had ever read or heard of.

Four demons filed before me—demons, beyond a doubt: their looks, which I noted well—their words, which I heard—their gestures, which I saw—their designs, with which I in that hour became acquainted—fully entitled them to the appellation.

They were passing around the pond. I saw their faces, one after another, as they emerged into the moonlight.

Foremost appeared the pale thin visage of Arens Ringgold; next, the sinister aquiline features of Spence; and, after him, the broad brutal face of the bulky Williams.

There were *four*—who was the fourth?

'Am I dreaming? Do my eyes deceive me? Is it real? Is it an illusion? Are my senses gone astray—or is it only a resemblance, a counterpart? No—no—no! It is no counterpart, but the man himself!—that black curling hair, that tawny skin, the form, the gait—all, all are his. O God! it is *Yellow Jake*!'

DUTCH POETESSES.

THE application of a bad name to a dog is said to be equivalent to capital punishment. In the case of Holland, a whole people has suffered from the effects of an unfortunate designation. It is difficult to conceive that anything Dutch can be poetic, or that any man who is a Dutchman can be a hero of romance. It seems to be a generally admitted fact, that Holland is the country of dulness and common-place respectability, where all the women are fat and all the men are stupid, where a dike is the nearest approach to Parnassus, and where the only use of Pegasus would be to tow a *trekschuit*. Against Dutch books might be urged, without fear of contradiction, the charge that was formerly brought against those of Germany, 'that

they smell of groceries, of brown papers filled with greasy cakes and slices of bacon, and of fryings in frowzy back-parlours.' No wonder that there was a prejudice against German literature in days when a Schiller would have figured as 'a High-Dutch poet:' the name would have been fatal. Hollandish or Batavian would have been comparatively respectable. In the ages of erudition, when Holland was, in the words of Hallam, 'pre-eminently the literary country of Europe,' the Dutch writers were well aware of the advantage of bearing a good name. Nowhere did humble patronymics find themselves Latinised or Hellenised into greater splendour than in Holland; syllables that Fame would have been ashamed to whisper, acquired a grandeur that rendered them worthy to be bawled in her best trumpet-tones; the controversialists of the times assumed titles which bore the same relation to their original names that the classic toga bears to the gent's paletot; and even the author of a work proving that Adam and Eve talked Dutch in Paradise, inflated his simple appellation of Jan Van Gorp into *Toropius Becanus*.

Certainly Dutch cognomens are not remarkable for dignity. Nor is it in its proper names alone that the language is at fault; there is something ludicrous about the sound and the aspect of many of its words: only to a native eye can a Dutch sentence convey a pleasing sensation; the superfluity of *r's* gives it a cumbersome and lazy look: the vowels seem constantly to be jostling each other; as, for instance, in the epithet *blauwvoogig*—what a term to apply to the blue-eyed object of a poet's raptures!—and the frequent elision of vowels sometimes reduces a verse to little more than a row of consonants, hooked together by a series of apostrophes.

But if the language has its drawbacks, it can boast its merits also. A Dutchman is never weary of singing the praises of his native tongue—its strength, its serene majesty, its copiousness, its power of expressing the sense by the sound; its store of diminutives and terms of endearment; and of contrasting all these glories with the mean, weak poverty of the detested language of France. He might mention, as an additional merit, its likeness to our own speech, although the resemblance may remind a prejudiced Englishman of that which the monkey bears to man. Many of its words look remarkably like caricatures of ours, and every Dutch newspaper bears a certain likeness to the *Phonetic Nuz*.

A very ingenious theory was propounded, some years ago, by a gentleman who wrote four volumes in order to prove that all our nursery-rhymes were originally Dutch satires upon the clergy; as, for example:

Jack Sprat
Had a cat;
It had but one ear;
It went to buy butter
When butter was dear.

This simple narrative is metamorphosed by Mr Bellenden Ker into the following epigram:

Jacks Praet
Huydt er gult;
'Et huydt bot wan hier;
'Et wint toe baei bot er;
Wee'n bot er! wo aes dij hier?

which he paraphrases: 'The churchman's tales, while they serve to fill the rogue's belly on the one hand, serve to pinch that of doltish cloddy on the other; they convert the cloddy-dupe into the provider of the woollen-gowned gentry (the friars),' &c.

Holland is styled 'the land of song' by its inhabitants, who have ever been greatly addicted to the habit of rhyming, and who hold a poet in high esteem. Their

literature is very rich in popular lyrics, lovingly preserved and handed down from generation to generation; and few songsters have maintained so firm a hold over the affections of posterity, as Father Jacob Cats, whose memory and whose verses are embalmed in the heart of every true Dutchman. For more than two centuries, the songs of this Franklin of Holland have been the delight of his countrymen, and to know Cats by heart is said to be necessary before the student can pretend to any knowledge of the Dutch language.

In the palmy days of Holland, the vernacular tongue was almost surrendered to the unlearned, and the literary giants of the age clothed their thoughts only in a Roman garb; but with the political decline of the state came a reaction in favour of the national tongue. In Belgium, the vernacular was fast becoming obsolete, and it seemed that French was destined to be the language of the country, when a revival of the decaying speech was commenced about the middle of the last century. This gave rise to the division between Flemish and Dutch, as the dialect of Antwerp was adopted, and became general throughout the Austrian Netherlands. For a long time it was considered unworthy the attention of literary men; but lately a band of zealous national authors, first among whom stands Hendrik Conscience, have written in it with marked success.

Holland has been peculiarly rich in authoresses. Many of its most distinguished men of letters have transmitted the flame of genius to their daughters; and from the time of Anna Byns to the present day, there has been a succession of poetesses, whose statues would fill no inconsiderable space in the Dutch Pantheon.

A work has lately been published at Amsterdam, by Mr Van der Aa, containing a selection from the poems ('Pearls') of these ladies, and may serve to correct the popular ideas concerning the women of Holland. The poetry is not of the highest order of merit; there is no great originality of conception or vigour of execution to be found in the book, through which, as in most poetry written by the gentler sex, a strain of melancholy prevails; but much of it is graceful and touching. We select a few of the shorter pieces, which may convey an idea of the works of these ladies of Holland, and may perhaps avail to sweep away a few of the prejudices that must cling around the dreadful name of *Vrouw*.

The following poem is by Adelaide Kleyn, authoress of *Oden en Elegien* and *Nieuwe dichterlijke Mengelingen*, who died at Leyden in 1828:

THE WATCHMAN.

Watchman! thou whose salutations
Lonely through the darkness ring,
Who in saddest tribulations
Still must force thy lips to sing—

Whom, though toils by day may weary,
No sweet rest awaits at night,
Till thine eye through watchings dreary
Find the morning's rosy light:

Thou to me art Hope's revealer—
Let me keep thy duteous way,
Whether through the dusk I steal, or
Front the cheerful light of day.

I through all the wide horizon
Seek a better Fatherland,
But the seas I fix my eyes on
Hide as yet that sunny strand.

Round me, round me, creeps the gloaming,
Anxious cares upon me throng;
I, like thee, alone am roaming,
Sing, like thee, a lonely song.

But mine eye, through shadows straining,
Sees where lights with shadows blend;
Sees the hour of rest remaining
Steadfast for me at the end.

The verses on 'Tears' are by a lady of the name of Van Streek, *née* Brinkman, who also died in the year 1828. In addition to her lyric and dramatic compositions, she published a romance called *Julius en Amalie*, and translated the *Æneid*.

TEARS.

O tears! When we are sunk in sorrow,
'Tis you that soothe us, you that bless;
You bring to those a lighted morrow
Who swoon in darkness and distress:

And they whose bleeding bosoms languish
From wounds that never cease their flow,
Find, in their own sad drops of anguish,
A tender anodyne of woe.

To every tear of mute compassion
The poor with grateful smiles reply,
And welcome, in their homely fashion,
The magic of a moistened eye.

When friends o'er some green grave are weeping,
By no funeral pomp defiled,
Their tears descend to him that's sleeping,
Pure as the kisses of a child.

Therefore, when next the dark'ning hours
To me some mournful message bring,
Flow fast, sweet tears, and give your showers
The breezy coolness of the spring!

We conclude with a few lines to Death by Albertine Rijfkoel, who died at the age of twenty years, after a long and painful illness, during which she dictated a number of simple and touching poems to her father, who published them after her death.

TO THE BROTHER OF SLEEP.

Thee Folly waits with fear: but Wisdom smiling meets thee,

And finds in thee the best, the truest of all friends;
From many a couch of pain the weary sufferer greets thee,

Thy sympathising hand his term of sorrow ends.

I think of thee with joy, with patient expectation,

Until thy gentle touch shall lull me into rest;

Come, kindly friend, subdue my heart-string's last vibration,

And lap me in soft slumber, pillowed on thy breast.

THE MONTH:

SCIENCE AND ARTS.

Art has been making its usual winter-season demonstrations, perhaps with clearer purpose than heretofore. Lectures by the ablest men on art, ancient and modern—on Gothic Architecture, at the Royal Academy and at the South Kensington Museum—on Colour as applied to Architecture, at the Institute in Grosvenor Street—an Architectural Exhibition at the rooms in Suffolk Street—the Photographic Society's Exhibition at their rooms in Coventry Street, shewing unmistakable signs of progress—and Schools of Design as unmistakably flourishing—all testify to the growing interest of the people in the subject. Then we are to have a Great Exhibition memorial, and a Crimean monument, both probably in Hyde Park; and Sheffield is erecting a Crimean monument, which, in spite of the smoke, could not have a better site. It is to be sixty feet high, a handsome arched canopy finished with crockets and finials, within which, on the solid base, will be placed a sitting figure of

Victory. If we cannot be made a nation of artists by cultivation, it will clearly not be from want of endeavour.

So far as can be foreseen, a new style of architecture is not likely to be invented in the present century; and the best that architects can do is to work, with an enlightened eclecticism, upon the most beautiful of that which was produced either in the dark or classical ages, according to the building they have in hand, and conform our modern, our new buildings to it; for there is no good reason why beauty should not combine with utility. One of the ramifications of this subject has been discussed before the Society of Arts in a paper 'On House-construction, and its bearing on Social Welfare.' As regards the wholesomeness of buildings, we notice a paper by Dr H. E. Roscoe, Professor at Owen's College, Manchester, which, though it contains little that was not already known, is nevertheless valuable as recording facts and defining principles. The paper is entitled, 'Some Chemical Facts respecting the Atmosphere of Dwelling-houses;' and first, we are told that the quantity of carbonic acid given off by an adult man is rather more than nineteen litres an hour, and that it is not so much the diminution of the oxygen in a room that deteriorates the air, as the charging it with foul and waste matters. The normal amount of carbonic acid in the open air is 4 parts in 10,000, and the air indoors should as much as possible be kept in the same condition. Carbonic oxide—one of the products of combustion—is immediately fatal when present in an atmosphere to the amount of 1 per cent. only. Dr Roscoe agrees with Dr Arnott that at least 20 cubic feet of fresh air are required for each person every minute, to remove all the noxious and disagreeable effluvia, especially in crowded habitations, schools, barracks, and the like. But he finds that certain natural causes operate to weaken the hurtful consequences of bad ventilation—namely, diffusion through the walls. It appears from experiment, that carbonic acid actually escapes in that way through brick and mortar, and maintains the atmosphere in something like its proper condition. Hence the unhealthiness of new damp houses, and of iron houses, through the walls of which no diffusion can take place. Emigrants and travellers, who trust in iron houses, would do well to hold this fact in remembrance.

The launch of the *Leviathan* has inspired an inventor with the notion of a gas-ram, simple enough in construction, but requiring demonstration. Gas is admitted into a cylinder to raise a piston by which the lift or push is to be effected.—Gas is now successfully used to heat green-houses, and with manifest advantage, as it admits of regulation with nicety to any degree of temperature. And, if the statement be true, gas is a preventive of contagion; for, according to accounts from Lisbon, the yellow fever did not visit the houses in that city which are lighted with gas.

The application of steam to agriculture is becoming more and more an accomplished fact. The Society of Arts have given an evening to 'steam-cultivation;' and sundry enterprising farmers are making trial of the 'Guideway' steam-machinery, which includes rails, whereby the tramping of the field during the ploughing is avoided. We think it probable that in the course of another ten years, steam-ploughing will be general on all our large farms—and few are small now.

Pisciculture is to have a chance in the south as well as in the north. The Regius Professor of Medicine at Oxford, jointly with Sir W. C. Trevelyan, offer a prize of £20 to a *bona-fide* resident in the counties of Oxon or Berks, 'for the best essay on the methods of introducing and rearing fish in the waters of the Cherwell and the Isis.'

M. Menigault has made a series of experiments,

extending over several years, on wheat—on the causes which alter and deteriorate it, and the means of its preservation—which admits of practical application. He has examined the grain under every possible condition of heat, moisture, dryness, and cold, aggregation and diffusion. Among his conclusions, we find that the hygrometric condition of wheat varies $\frac{1}{4}$ per cent. in an ordinary atmosphere; that, however carefully heaped, there is always one-third of empty space in the heap; that soaking in water for eight days facilitates the growth of wheat; that imprisonment in ice for six months will not destroy its vitality; that when perfectly dried, it will keep for an indefinite time; that in a temperature of 103 degrees, it is completely spoiled in a month; and that heat and damp combined are the sole causes of corruption in wheat. If precautions are taken based upon these facts, there will be nothing to fear, for instance, from insects.

Fresenius, a German chemist, has made experiments on various kinds of fruits, demonstrating which are best, and why. The more a fruit contains of soluble matter, the more is it esteemed—such as the peach and greengage. And the more a fruit is cultivated, the more does it contain of sugar, and the less of free acid and insoluble matter. These facts may serve for household hints.—A French chemist has investigated the poisonous principle in the oleander, with a view to discover its medicinal properties. This tree grows abundantly in Algiers and in Spain. During the Peninsular War, many deaths occurred in Marshal Suchet's division from poison, owing, as was reported, to the men having roasted their meat on oleander spits at oleander fires.—Rudolf Wagner shews that a solution of decomposed salicylate of potash yields a liquor strongly charged with the scent of roses; and if this be distilled, it becomes an excellent artificial rose-water. Out of this, a new branch of industry may perhaps be created, for the substance is comparatively cheap, and rose-water is in much request as a luxury for the toilet.

The *Bulletin* of the Acclimation Society at Paris has an account of the quillay (*Quillaga Saponaria*), a tree which grows in the Cordilleras of South America, and of which the bark constitutes an important article of trade in Chili. Silks washed in water in which this bark has been macerated, preserve their colour a long time unaltered; but the principal use made of it is as a wash for the head once or twice a week. To this the women of Chili and of adjacent countries are indebted for the beauty and luxuriance of their hair; and it is said that not a few of the men make use of it also. It has, besides, a medicinal property, and is administered as a febrifuge.

A new kind of gutta-percha, and, as is said, the best, has been imported into Holland from Surinam. It is a product of a species of *sapodilla* which grows on the higher parts of the great savannas, and in such abundance, that for years to come the supply will be equal to the demand. The Americans have made themselves busy in that quarter of late; have surveyed a number of excellent harbours in the north of Sumatra, which were before scarcely known, and have contrived to get the principal share of the spice-trade of that island. We, on the other hand, have taken possession of the Keeling, or Cocos Islands, and find them to be a convenient half-way station between Ceylon and Western Australia. The inhabitants number about twenty European families, and a hundred Malays.—Our government and that of the United States are about to send a large party to make a joint survey of the boundary-line between the British and American territory on the Pacific side of the Rocky Mountains: our own party will subsequently explore Vancouver's Island, and in

order to get the best knowledge of the country, and to benefit science, the Foreign Office has asked the Royal Society to suggest inquiries and observations, and to recommend competent persons to carry them out.—And talking of explorations, we are reminded that the party which accompanies Dr Livingstone comprises his brother, a skilled economic botanist, and a mining geologist, besides an engineer for the steam-launch, and qualified persons for other duties. They take with them an iron house, which is to be set up in the highlands at the confluence of the Kafue with the Zambezi, where land is to be cultivated, so as to become the nucleus of a permanent settlement. Hence we may hope to gain a practical knowledge of the mineral and vegetable productions of Eastern Africa.—The news from the Niger is not encouraging. Dr Baikie had lost his steamer on rocks in the river; we hear, however, that another vessel has been sent out to enable him to resume his explorations.

We mentioned, some time since, that the New Zealand government had advertised considerable money-prizes for the best samples and quantities of native flax, in the raw and dressed state. We are glad to add, that response has been made in the way desired, and that the samples sent in for competition have been forwarded by the colonial government to the Society of Arts, where they may be examined by all who are interested in the important question of fibrous materials. If carried out as it has begun, there is no doubt that the flax-trade will be as beneficial to the New Zealanders as to manufacturers in this country. One of the competitors, Baron de Thierry of Auckland, gives an interesting description of his mode of treatment: boiling and alkali alike failed to convert the plant *Phormium tenax* into a fit state; but he succeeded with steam, and can make flax 'for sale at L.15 per ton at a large profit.' He claims, moreover, to have discovered a new kind named *Ti*, which can be sold at L.12 a ton, and 'will be found applicable to the finest textures, from lace downwards.' Dundee, and some other of our manufacturing towns, will hear of this with pleasure, and with visions of profit. For their information, we quote an interesting passage from the Society's Journal. 'The *Ti*,' says the baron, 'is a tree which grows as high as twenty to thirty feet, and the flax is the product of the leaves, which are about three feet long, and from three-quarters to an inch in width. The whole tree is of a stringy nature. It is very hardy, and cuttings upwards of six inches diameter will take root in moist land. It grows in swamps where nothing else will stand; it makes an impenetrable live fence; it grows either in or out of water, and prospers on the highest hill and in the deepest gully.' Here is an element of trade and prosperity! Only get the shrewd natives, so alive to their own interests, to cultivate the *Ti*, and there will be no lack of flax in our markets.

As we have from time to time noted the movements of the Pitcairn islanders, we take the opportunity here to mention that Sir W. Denison, governor of Tasmania, has paid them a visit in their new home on Norfolk Island, and established a form of government for them. It is essentially democratic. On the day after Christmas-day in every year, they are to meet to elect their chief-magistrate, who must not be under the age of twenty-eight. Every man of twenty-one is entitled to vote. The chaplain is intrusted with considerable powers; he is the returning-officer, and has the entire charge of education. Among the regulations for preserving the moral and physical welfare of the singularly interesting community, one is, that no beer or spirits shall be used on the island except as medicine. What will become of their old home, the lonely islet? left now to the care of Nature, or to be a resort of whalers?

We are glad to learn that the ways and means for Mr Robert Mallet's journey to Italy were supplied out of the government grant fund administered by the Royal Society. This gentleman's name appeared in our last. We recur to the subject, because at the latest accounts the earthquake phenomena were still recurring, and he is well qualified to describe them, and judge of their geological relations. Among his credentials, he carries an encyclical letter from his eminence Cardinal Wiseman, which perhaps, more than any other, will facilitate his inquiries in country districts where the village-priest is the only man able to give information. We may hope to hear of the results in about two months.

The counter-shock of these Neapolitan earthquakes has been felt in places far distant: near the Adriatic, and onwards into Carinthia, Illyria, and the Carpathians. The general direction was north and south; but when the movement struck the Alps, lateral vibrations were sent off from east to west. Some accounts state that there are signs of upheaval along parts of the coast of Naples.—In the Indian Archipelago also, and in America, great convulsions have taken place. At Payta, the results were surprising. The bay was observed to be swarming with crabs of a species rarely seen; after some days, an earthquake was felt, and a week later, there was a bank of crabs from three to four feet wide, and three feet high, thrown up all round the bay, and the water changed from a clear blue to a blackish green colour.—And in North America, as described by Professor Cook at the last meeting of the American Association for the Advancement of Science, subsidence is going on all along the coast from Delaware Bay to Boston. In New Jersey and Long Island, the effects are especially observable. Hundreds of thousands of acres of submerged forest lie a few feet below the swampy surface, and many farms are diminished in extent by the tide flowing further over the uplands than was formerly the case. Professor Cook estimates the subsidence at two feet in a century.—Mr Leonard Horner has just read the second part of his paper on the alluvial land of Egypt, to the Royal Society. He laid on the table a piece of pottery brought to light by his researches, which he believes was made by human hands 18,000 years before the Christian era.

In connection with these phenomena, we may notice those of the weather; for the fact that half the winter quarter has passed without snow or severe frost is remarkable; and it would appear, as M. Babinet told the Academy of Sciences at Paris, that an unusual broadening of the Gulf Stream, whereby the warm water has come nearer to our shores, is the cause. Rain has been scant; and the Rhine, Danube, and Loire are lower than at any time within the present century. But then the New Yorkers, on their side of the ocean, complain that their winter is too mild; they have not been able to use their sleighs, and are uneasy about their ice-harvest. On the other hand, it has been excessively cold in Piedmont, at Malta, and other parts of the south. Perhaps our turn is to come when our north-east monsoon (for such it is) begins to blow in the spring.

The Canadian Institute are trying to organise a plan proposed by Professor Kingston of Toronto, for telegraphing the approach of storms. Twenty stations are fixed on, ranging from Halifax to Goderich in Upper Canada; and it is thought the plan may be worked at a cost of two hundred dollars a year. One of the data on which it is based is, 'that gales prevail in some localities many hours, sometimes two or three days, before they reach other places only a few hundred miles distant.' Hence half-hourly signals may be flashed along the coast of the sea and of the great lakes, and mariners may prepare for the blast, or get out of the way; and landmen may be warned

of the hurricanes that rush at times with fearful destruction across the fields and forests. Toronto is to be the central station; and there tabulated records will be kept of all the phenomena.

An American M.D. has brought to England the Canadian, Alexis St Martin, who has been frequently mentioned in physiological works, as having a hole in his side through which the interior of his stomach can be seen. The visit will doubtless be taken advantage of by our physiologists to settle some of the unsettled points in the phenomena of digestion.

THE STREET-MUSICIAN.

Who is not acquainted with the chorus of trumpets, blowing brass discord throughout our streets in every note of the gamut simultaneously? What Londoner is ignorant of the drone of the organ, grinding solemn parodies of *Adoro Fideles*, or the *Old Hundred*; or exciting a wretched monkey in Highland costume to exhibit withered gambols for the behoof of a race of ragged pigmies, bent on mimicry, or lost in wonder; or to clash his cymbals with a horrible bathos in the face of the human automaton, who awakens his martial ardour by mechanically expressing *Partant pour la Syrie*, or the *Marsellaise*? Then there is the twanging harp, which comes at twilight, discoursing bold symphonies quite innocent of theory, to plaintive vocal strains; and the port flute extinguishing impossible operatic themes in a cataract of whimsical variations. On a wet and windy morning, you may reckon on encountering a tempest-tossed petticoat, screaming street-ballads against wind and weather; and you must account yourself fortunate if the same afternoon you escape the ambush laid for you in the shape of a family fugue, alternating in startling violence from gruff, surly bass, to shrill, quavering treble, and winding up with a chorus of juveniles, whose only initiation into the mysteries of the joyous science has been the melody of a 'cat's concert.' In this age of competition and insincerity, no calling, however humble, has escaped the general contagion; and it is pleasant now-a-days to meet with even a street-musician too simple for suspicion, and too candid to impose. For even here, life scatters its true poetry; and now and then, a chord of real music, the music of nature and humanity, will startle us into a smile of pleasure, and give back to us the delight and the glory of faith.

It was Christmas-eve. A thick, heavy fog was shortening the brief light of the late December day, and mimicking the pleasure-seekers of a full hour of their first holiday. The fog was as cold as snow, and not half so pleasant; and the passengurs in the crowded thoroughfares, jostling one another as they hurried home to their good Yule-fires, scornfully bestowed a glance on the boughs of 'Christmas' that flashed cheerily, red and green, among the doors and windows, under the early gaslight. Still less likely to detain them for an instant was the merry tinkle of a street-piano, hardly audible, indeed, among the roar and murmur of the Strand. Yet it was a beautiful piano in its way, quite tunable, and with something innocent and bird-like in its notes, chasing one another with the headlong, silvery haste of that fascinating toy, a musical-box. Its glories of rose and purple silk were shrouded for the moment in a covering of green balm, prepared by the careful artist against atmospheric emergencies—much to the disimination of certain youngsters who had followed, with inaudible perseverance, from street to street, the merry cycle of tunes. The itinerant was a foreigner, still young, with nothing that could be called characteristic in his personal appearance, except the French sparkle in his eyes, the unmistakable abandon of his motions, and the watchful anxiety with which he

regarded a very little child, who beat a tambourine at his feet. She was not more than three years old, a dancing creature with a bright, fair face, her yellow hair hanging into her saucy blue eyes, from beneath the shadow of a little hat, which, old and ragged as it was, set off her childish beauty gracefully enough. In that great rushing crowd they stood alone, the man and the child, the loud world hurrying by. 'Bertha,' he called her; and she laughed when he spoke: laughed to the passengurs who stopped for a moment to drop half-pence into her baby drum, and shook out her pretty music in downright defiance of time and tune, for which it was all the prettier. The picture was suggestive, and it was easy to divine their case; for the peculiar guardian tenderness in the eyes of the man, is an anomaly seldom observable except in brave dogs and the fathers of motherless children.

Karl Rosen, a Switzer of one of the French cantons. His Bertha had died among the mountains yonder, and left the little one behind her. No, she was not much of a care, and a great deal of comfort. *C'est la bon Dieu*. This was all. It was a simple tale enough, and their faces told it for them better than words. The child had fastened her eyes on the splendours of the toy-shops—all she was like to know of 'Noël,' poor little soul; she had danced in the joy of her innocent heart, and beaten proud 'music' to her favourite tunes. But the day was drawing in very fast; the air grew more raw and chill; the street-lamps began to blink through the fog; little Bertha's feet were heavy and chill; was it mist that hung in her pretty blue eyes?

The street-musician looks at her, stops short in the very middle of his liveliest tune, shoulders his pole and his piano, lifts the little thing tenderly on one arm, while the other steals from her uncertain grasp the ponderous tambourine. She, with both her small hands clasped tight round his neck, and her cheek resting on his shoulder, forgets weariness, hunger, cold; her merry laugh rings out again, but quietly; and with snatches of prattle, and sighs of happiness, they trudge away into the cold, cloudy twilight, as unmettable of 'peace and good-will'—sending up their unconscious amen to the tender glory of the Christmas chorus, already faintly rising, if we would but listen, in the deep heaven yonder, among the stars.

INDIGENT GENTLEWOMEN OF SCOTLAND.

It will be readily admitted that there is no sort of persons with greater claims upon a compassionate regard than aged females of the middle and upper classes, who, from non-marriage or widowhood, or any other contingency, have been left to spin out their last years in poverty. The indigent gentlewoman is everywhere a person of frequent occurrence. The families of clergymen, of military officers, of professional men, and of the minor gentry, supply them in great numbers. Persons, too, who have in earlier years been useful as teachers, often become indigent gentlewomen in old age.

Under a sense of the needs and deservings of many of these ladies, a few individuals in Scotland turned, about ten years ago, a society for the maintenance of what is called *The Indigent Gentlewomen's Fund*. It is an institution of which we can scarcely speak in terms of too high approbation. A vast number of gentlemen and clergymen throughout the country are connected with it, and there is a most extensive organisation of ladies for the collection of funds, application being systematically made annually at every house where individuals of the middle and upper classes reside. The society's object was not to support, but merely to aid and comfort these unhappy solitaires, after they had passed their fiftieth year; and we are proud to say that we recognise in the result the old kindly feeling

of the people of Scotland. The most scrupulous delicacy was observed in distributing the relief; and no aid from a public charity was ever administered in a way less likely to wound the feelings of the recipients. At the very first annual distribution of the fund, the sum of £878 was divided among 154 applicants. Last year, the annuitants numbered 322, and the sum distributed among them was £2060. The pecuniary assistance given by the society is small—but how important to the threadbare economical gentility of the class! An annuity of £5 to £15, to which the regular aid is limited, is found absolutely to elevate these old ladies from almost destitution to comfort. In particular cases, a trifle is sometimes given in addition to the annuity; and the following is copied as a fair specimen of the applications made for this benevolence: 'Humbly sheweth—that your petitioner has been a grateful recipient of the fund for some years, and that to the extent of £6 annually. That your petitioner for thirty years has almost entirely supported herself by teaching. That your petitioner is eighty years of age. Until two months ago, she has continued to teach; but, from extreme age and growing infirmities, she has now been obliged to give up her school.'

We need not say that ladies were from the first the main support of this admirable institution. In 1850, bazaars for the sale of ladies' work for the benefit of the fund were held in the principal towns in Scotland; and the produce was so considerable, as to warrant the institution of a sinking fund to provide for the greater stability of the society. The amount of this fund, to which come to be added every year legacies and donations, was, at the close of the financial year 1856, £5896.

To give an idea of the kind of cases which come before the society, we copy the following applications:

'(3-119.) — aged 93.—Petitioner is the daughter of the late — of —, sometime an extensive landed proprietor in the county of —. He was ruined by the failure of the — Bank, and died in 1802. With what she had saved by her own exertions, petitioner has hitherto been enabled to support herself; but now old age and infirmities have left her little to depend on, excepting what she receives through the kindness of friends. She has been confined to bed for nearly two years. Any relation she has is very distant.

'(1-65.) — aged 75.—Petitioner is the daughter of the late Rev. —, sometime clergyman of the parish of —. Her income is £10 per annum, purchased by her some years ago. She receives also occasional assistance from friends.

'(3-108.) — aged 72.—Petitioner is the daughter of the late —, sometime overseer of the extensive — Mines at —. He farmed at the same time the lands of —, belonging to the Duke of —, and the lands of — and —, belonging to the Marquis of —. Petitioner has now no income, excepting the trifle which she makes by sewing.

'(3-63.)—Petitioner is the daughter of the late —, M.D. Her income consists of the interest of a small sum of money earned by her own exertions. She has been a governess for nearly thirty years, and, if health permitted, is still willing to contribute to her own support by the exercise of her talents. She has no home, but is at present residing with a friend.'

After these melancholy cases, it gives us much satisfaction to add, that it is not an uncommon thing for an allowance to be resigned when the annuitant's circumstances have changed for the better; and that in one case, the whole amount that had been received was returned with interest.

For the above particulars, we are indebted to the Tenth Annual Report of the Committee of Management, and we recommend strongly to our readers a careful perusal of this document. Why should such a society be confined to Scotland? Could there be any more graceful and useful employment for ladies and clergymen in each of the wealthy counties of England, than the establishment of a similar institution? We trust the hint will fructify; and we are sure the secretary of the

Scottish Indigent Gentlewomen's Fund Society, Mr Fullarton, 5 Castle Terrace, Edinburgh, will be happy to assist with any information that it may be in his power to give.

A DEAD SEA-GULL:

NEAR LIVERPOOL.

LACK-LUSTRE eye and idle wing,
And smirched breast that skims no more,
White as the white foam, o'er the wave—
Hast thou not even a grave
Upon the dreary shore,
Forlorn, forgotten thing?

Thou whom the deep seas could not drown,
Nor all the elements affright,
Flashing, like thought, across the main,
Mocking the hurricane,
Screaming with wild delight
When the great ship went down:

Thee not thy beauty saved, nor mirth,
Nor daring, nor thy obscure lot
As one midst myriads; in quick haste
Fate caught thee as thou past—
Dead—how, it matters not;
Corrupting—earth to earth.

And not two leagues from where it lies,
Lie bodies once as free from stain,
And souls once gay as this sea-bird's,
Whom all the preachers' words
Will ne'er make white again,
Or from the dead arise.

Rot, pretty bird, in harmless clay!
We sing too much poetic woes:
Let us be doing while we can.
Go forth, thou Christian man,
On the dank shore seek those
Left dead of soul-decay.

THEORY OF SEA-SICKNESS.

The seat of the sense of nausea is the pit of the stomach, and there—like a sorcerer in his cave—lies the *solar plexus*. This, according to Erasmus Wilson (*Spas of Germany and Belgium*) is the god who is to be propitiated by those who are afraid of sea-sickness: some of whom offer him a good breakfast or a good dinner, a glass of grog, a pinch of cayenne-pepper, a dose of peppermint, camphor, creosote, laudanum, naphtha, ether, or chloroform. Others cover his pit externally with a camphor bag, and over it a warm plaster of cinnamon or frankincense. None of the internal preventives, Mr Wilson thinks, are worth anything, except a good dinner or breakfast at the usual time when the god is hungry, and soda-water when he is thirsty, with a little sherry or brandy in it; but the external remedies are better, chiefly because they bestow warmth and pressure. The cause of the sickness, however, is the unaccustomed motion—the vertical motion more especially, and added to that the horizontal and other motions we are more familiar with in a railway-carriage; and it is to this we are to apply any remedial process we adopt, with a view 'to fix the muscular system, over which we have control, and by that fixture to steady, if not totally to fix, the solar plexus.' Mr Wilson, after making experiments upon himself, advises that a belt, or, in the absence of that, a shawl, should be wound round the trunk, making strong pressure from the hips upwards to the middle of the chest, and that the patient—or rather he who is determined not to become a patient—should sit down on a bench, fix his heels against the deck, and resist with all his power any movement of the vessel.

GOING OUT TO PLAY.

Who that has lived to middle age, when to work has become the principal object of existence, does not look back with an amused interest, a half-melancholy wonder on that season when 'going out to play' was an acknowledged daily necessity; when we sallied forth with no pretence of duty or labour, neither to walk, nor ride, nor pay visits, nor do errands; bent on no definite scheme of action—going out simply and absolutely 'to play.' And those Saturday afternoons—those glorious whole holidays—those delicious accidental half-hours, form the largest feature in our recollections now.

Going out to play! It seems ludicrous to fancy ourselves ever doing such a thing—we, who have to tramp in and out of town on our daily business—and do it; or feel we are bound to pay a visit—and pay it; that it is our duty to take a constitutional walk—and we take it; to plan a pleasure-excursion—and we go through with it. But as for turning out of doors for a given space of time, to go nowhere and do nothing particular—what a ridiculous idea! It is only by a strong effort of mental transposition and retrogradation that we can sympathise with a certain dear little soul of my acquaintance, who, after being sedulously petted and entertained for a whole week by a houseful of benevolent grown-up people, said pathetically:

'Me want to go out and play! Me want a 'tittle girl to play with me! Me shouldn't care if she was a 'tittle girl in rage!'

Companionship in this play is a great matter—companionship based on quite different grounds from later-life friendship. Except a few, endowed with that passionate adhesiveness which is sure to prove in after-life at once their glory and their torment, children are seldom either unselfish or devoted in their attachments. Most of their loves are mere likings, contracted for the pleasure of the moment. Their dear little free hearts want neither a friend nor a lover—they only want 'somebody to play with.' Anybody will do—even the 'tittle girl in rage.' Those who have experienced that premature clouding of life's golden morning—a solitary childhood, may remember the wistful longing with which they have stood watching groups of dirty, happy little rogues, collected at street-corners and on village-greens, and how sorely they have rebelled at prohibitions to join them. Easy age! when there is no patrician exclusiveness, and very little of the eclecticism of personal tastes or affections: the chief thing wanted is society—companionship.

But as if in compensation, the tie, so slight then,

becomes afterwards so tightly riveted, that there are few pleasures purer or more exquisite than that taken by old playmates, or children of one family, in talking over every trivial thing belonging to their contemporary childhood. And the same free-masonry which makes most people hear patiently any sort of love-story, makes everybody listen with a vague interest to the chronicle of everybody else's childhood; for both themes form two out of the three universal facts of human life—birth, love, and death.

Therefore, it may amuse some, if, prior to saying a few serious words on the subject of play, I gossip a little, as we did the other night over our fire—I and the only one now left to gossip together over our childhood. We did so, apropos of the notion already started, that childhood is the only time when it is a necessary business—this going out to play.

We were not city children, thank goodness! We never had to be muffled as to the bodies, denuded as to the legs, our heads weighed down by beautiful hats and feathers, our feet compressed into the nastiest of boots, and sent out walking, solemnly and genteelly, through streets and squares. I am proud to say, ours was a very different costume. It consisted of a pinafore of common blue print, made after the pattern of a French blouse, put on over all our other clothes, fastened at the waist by a leather belt, and reaching nearly to the ankles, which, in boys and girls alike, were defended by stout shoes, merino stockings, and those substantial under-vestments which we were then not ashamed to call 'trousers.' Thus some light head-gear, cloth cap or straw-hat, was the only addition necessary to the universal, all-covering blue pinafore.

O sacred blue pinafore!—so warm, light, and comfortable—put off or on in a minute—allowing full liberty to run, jump, climb, scramble, or crawl, creating a sublime indifference to dirt or tears—that is, fractures—I have never seen any modern garment appropriated to children's wear which could at all be compared to this costume of my youth.

In it invariably we went out to play. Our play-place was the garden, the green, and the great field before the terrace where we lived: there was a tabooed region beyond, consisting of the parade and the public walks, where we were not allowed to go in our blue pinafores; but within the above limits, nobody and nothing interfered with us. On the green, ball-practice—not bullets—against a gable-end, tip-cat, trap-bat, prisoners' base, cricket, marbles, were carried on; likewise digging of holes and making of bonfires. The garden had its restrictions, especially as

the season of growing vegetables, though I remember a rhubarb-bed which mysteriously withered in consequence of a secret excavation under it, two or three feet deep; and an ash-tree, which, being made one of the principal supports of a hut—where there was a fire and a good deal of gunpowder used—was observed by next spring sensibly to have declined in its robustness of constitution.

But these things were trifles; so were a few prohibitions concerning the field, when it happened to be knee-deep in mud or snow, or filled with three hundred head of cattle which periodically visited it, for the poor burgesses of our town have enjoyed from time immemorial the right of successive pasturage in the three or four—I forget how many—large town-fields.

When they came to ours, what a jubilee it was! To be wakened by a distant murmur of lowing, neighing, shouting, trampling—to dart to the window, and see with sleepy eyes, in the gray dawn, our field covered, not with daisies and buttercups—these floral delights must be sacrificed forthwith—but with a moving multitude—equine, bovine, asinine; and gradually with countless milkmaids and milking-men, carrying their pails, or sitting peacefully leaning against well-behaved cows.

After then, no want of a place to play in. We used to get dressed by six A.M., leap the ditch-bank, mug in hand, to have it filled direct from the cow, our own particular animal; for we chose favourites, whose proceedings we watched, to whom we gave names—Daisy, Brownie, Cowslip, and the like—and over whom we were exceedingly jealous. Wo be to the individual who presumed to go for a pennyworth of milk to anybody else's cow! And still worse, who dared offend any but his or her own cows with what we were particularly fond of doing—namely, stirring them up, and squatting down on the yard or two of warmed and perfumy grass where they had been lying all night.

The other animals we patronised little, though occasionally it was fun to run after an infant donkey, or come stealthily behind some drowsy old mare, and twitch a hair or two, invaluable for fishing purposes, out of her long tail. Strange to say, I do not remember our ever coming to harm, though with the mixed cautiousness and fearlessness of country-bred children, we used to roam among these beasts all day over as long as they stayed; and we were inconsolable for at least an hour, when, starting up as usual to give a morning glance at our favourites, we would find the well-cropped field all brown, bare, and desolate—the cattle were gone!

Once, and only once, the great field was made into hay. The novelty of the thing—the beauty of acres upon acres of waving, flowery grass, the exquisite perfume when it was down, and the excitement during the whole of hay-time—lasting a good while, for I remember one end of the field was green again before the other was mown—makes that summer one of the most vivid points in our juvenile history. Its daily joys, being holiday joys, were only bounded by the terrible necessity of having to go to bed.

Even now, a sympathetic pang affects me, as I remember how dreadful it was to be 'fetched in' on those lovely summer nights; how we envied those 'poor' children on the green, who happier far than we respectable ones—and probably having no particular bed to go to—were allowed to play as long as ever they chose: how cruel it was to be undressed in broad daylight, and expected to go to sleep! which expectation, I must confess, was generally fulfilled in five minutes. Nevertheless, we rebelled, and kept up for years a fondly cherished dream of some time contriving to play out of doors all night long, and never go to bed at all.

And once we regularly planned this, laying a well-arranged plot—which, for the moral safety of any young reader, I beg to state, proves that, like most children, we were extremely naughty at times.

We thought, if we could only lie quiet and keep awake till all the household were asleep, we might steal down stairs, grope through the kitchen, unbolt the back-door—and so away! Out to play—when there was nobody about but ourselves; out under the stars, or obeying that summons—which to my mind still conjures up a dream of unattained bliss, that haunted at least a dozen years of my childhood—

The moon doth shine as bright as day;
Boys and girls, come out to play:
Come with a rattle, and come with a call;
Come with a good will, or come not at all!

For the furtherance of this plan, we determined to go to bed in our clothes. How we managed it, I now forget—whether we generously came in without being 'fetched,' and volunteered to put ourselves to bed, or tried some other *rus* calculated to throw dust into eyes that were aching with many cares, never understood till little boys and girls grow up to be fathers and mothers; but we certainly did manage it. To prevent discovery, we put on, outside all our clothes, our innocent-looking night-gowns—and lay down to sleep as quiet as mice, and as good as gold.

But fate was against us, as against most conspirators. Maternal surveillance missing the aforesaid clothes, including the boys' boots, which were safe on their feet, also, a little surprised at our all appearing so very fat in bed, proceeded to investigate. Alas! we were ignominiously found out, and made to undress and go to bed, like good children; and though, since then, we have kept many a night-watch, sleeping roofless under foreign stars, or seeing the English dawn break from sick-room windows, never, never have we been among the number of those fortunate little boys and girls who came out to play when the moon did 'shine as bright as day.'

But once, on a birthday, we obtained permission to rise early enough to go out and play by starlight. Well do I remember the look of that chilly November morning, the brightness of the stars, the intense blackness of the trees, the solitude of the terrace and the road; how hard we tried to persuade ourselves that it was very pleasant and that we enjoyed everything very much. Our chief proceeding, in defiance of numb fingers and tingling toes, was to gather laurel in order to make a crown for the hero of the day—who, protesting it was 'cold' and 'epidery,' declined putting it on his head after all, but placed it on the top of the pump. There for weeks we watched it dangle, watched it dolefully from behind windows, where, shut up with hooping-cough, we still protested—as even yet we protest—all save one, whose birthday passes by, outwardly unkept, and whose fair head has long since been laid down in peace, without any laurel-crown—that we would not on any account have missed that going out to play under the November stars.

Our play was sometimes exceedingly hard work. One laughs now to call to mind the extraordinary delight there was in digging a hole—not for any purpose or after any design, but simply digging a hole. We would be at it for entire days, with a perseverance worthy of Cornish miners or Australian gold-hunters. If our labour had any aim at all, it was that of digging till we came to water, which not unfrequently happened, and then our hole became a pond. Once, after hearing of the central fire, we started the idea of digging down in search of it, and burrowed several feet deep; when, finding the earth no warmer, we gave up our project. We never made any particular use of our holes, except to sit in

them occasionally, enthroned on brick-ends and pieces of stone from the neighbouring quarry; exceedingly proud and happy, but slightly damp and uncomfortable.

But towards the 5th of November, the great epoch in our year, we ceased to dig, and began to build. Our architecture was at first very simple, consisting merely of a few bricks, so placed as to keep off the wind from our bonfire. From that, we planned seats round it, where we might watch our potatoes roast, and light our crackers at ease. Then, after reading Cooper's novels, and George Lillie Craik's *New Zealanders*, we conceived the bold idea of erecting a sort of wigwam. More than one was attempted, and failed; the last, which lingers in most vivid recollection, is that before mentioned, of which the door-post was the ill-fated mountain-sash.

Aladdin's palace was nothing to this wonder of architecture. Its site was in a triangular corner, where two walls joined—the other walls were built of quarry-stones and earth. Its roof had proper beams—old pea-sticks, or, as we called them, 'pea-rice'; and was slated over with thin stones. There was a chimney, with two seats in the chimney-corner, quite proper and comfortable, save that in these seats, or any other, you never could get further than eighteen inches from the fire; and that the smoke obstinately persisted in going out anywhere except by the chimney.

Nevertheless, it was a magnificent house, impervious to wind and rain, except on very bad days. In it we spent our holiday afternoons, for many weeks—obliged to rush out at intervals to clear eyes, mouths, and noses from the smoke, and to cool ourselves after being nearly as well roasted as our potatoes: still, I repeat, it was a magnificent dwelling. It finally, like all mansions, fell into decay; the last thing remembered of it being that one of our boys, in bearing the roof down, saw, to his horror, emerging from the ruins, a school-fellow, who had sat by the hearth all the time, and now shook himself composedly, put on his cap and walked away—perfectly safe and sound. Truly, children, like cats, have nine lives.

These were winter pleasures. In those days, what a grand event was the first frost, which I have known come as early as the 9th of November—'mayor-choosing-day,' or 'clouting-day'—which, by an old town-custom, was the very saturnalia of play. All the children in every school or private house were 'clouted out' by a body of young revolutionists, armed with 'clouts'—knotted ropes—with which they battered at school-doors till the delighted prisoners were set free. Woe be to the master or mistress who refused the holiday! for there would not have been a whole pane left in their windows; and I doubt if his worship, the new mayor, would have dared to fly in the face of public opinion by punishing any 'clouter-out.'

Our next era was 'when the canal bore'—which meant, when that famous piece of water, our Thames, our Rhine, our Loch Lomond, our Lake Superior, was hard enough for skating; when we could actually walk on foot across those depths, sacred to boat-sailing and fishing; and kick our heels against the clumps of frozen water-grass, which had wrecked many a bold ship, and harboured many a gudgeon, swimming away with our unfortunate hook in his mouth—sorely lamented by us, but not, I fear, because—like George Stephenson's cow—it was rather unfortunate for the gudgeon.

We knew we every inch along the canal banks—up to the big stones, where the skaters used to sit tying on their skates, and the timid lookers-on stand watching the two beautiful slides that were always made right across the canal basin. We had never heard then of Webster, R. A.; but his famous 'Slide'

in the Art-Treasures Exhibition brought back to me, as it must have done to thousands more, those glorious frosts of old, when we were out at play from daylight till dusk, as merry as crickets and as warm as 'toasts'—barring our noses, toes, and finger-ends; running in at noon for a scrap of dinner, which we gobbled down as fast as possible—bless us! we had the digestion of young ostriches: and were off again instantaneously. For, who could tell? it might be a thaw to-morrow.

In one thaw after a long frost, we—in the absence of lawful authority—performed a feat which under no other circumstances could have happened; and which, in its daring originality, still gives us a degree of naughty satisfaction. We discovered that the canal opposite a coal-wharf had been broken up by boats into large blocks of ice, which still went floating about. One of us, who had unluckily been presented with a volume of Arctic Voyages, embarked on the nearest of these icebergs, and went floating about too—guiding his course by the aid of a long pole. Of course, there were some half-a-dozen more imitating him. O the delight of that sail—in its total ignoring of danger, its indifference to shipwreck, and cool enjoyment of submersion! One of the voyagers still tells with pride that he 'got in' up to the neck three times that afternoon—the only termination of which was his being obliged to go to bed, because the whole of his available wardrobe was hanging to dry by the kitchen-fire.

Nothing worse happened, much as it might have been deserved. And if that handful of fool-hardy lads—one or two of whom, chancing to read this, may call to mind that very afternoon's play—could be gathered together now, out of India, China, Australia, from happy paternal English homes, and quiet graves, where the solitary name, left behind to neither wife nor child, moulders away upon the forgotten head-stone—happy they if they could plead guilty to no freak more perilous, no delirium of pleasure more fatal, than the sailing on those icebergs across our old canal!

But reflecting on these facts of our childhood—we, brought up with at least as much care as falls to the lot of middle-class children generally—on our daily risks of life and limb, and moral contamination—though this latter was a less peril, as it is to all who have the safeguard of a good mother and an innocent home; and yet remembering what a boundless enjoyment, what a vital necessity was to us this going out to play; we cannot but ponder deeply on the lot of those other children whom we used to envy for being allowed to play anywhere and anyhow, without being called in to the interruption of meals or the ignominy of bed. "Poor" children—as with a genteel school-mistress's accentuation of the adjective, Dickens's *Miss Monflathers* terms them—we have come to think differently of them now. Not exactly for their poverty—hunger is sauce to any fare, short of no fare at all, and dirt makes a capital substitute for clothes: in hard times, it is rarely the children who suffer, at least consciously. Nevertheless, we view them with a full heart. We wonder how, in cities especially, they ever manage to arrive at maturity, or, so surviving, and blessed with their due share of limbs and bodily faculties, that they do not all turn out thieves, rogues, sluts—or worse. We marvel at finding anywhere decent, sober workmen, and tidy workmen's wives.

Dangers infinite, all children must meet: it is an old saying, half true and half profane, that Providence guards the child and the drunkard; but Providence guards by strictly natural means—namely, the exceeding elasticity of frame, tenacity of life, and power of eradicating evil by perpetually renewed growth, which belongs to all young animals. There

is no need to double the risks, as they are doubled and trebled to poor people's children—that class upon which society depends mainly for health, labour, and industry. Any person of common sense, during an hour's walk along the streets of London or any large town, will have sufficient evidence on this subject.

Now, it seems pretty well agreed upon by modern philanthropists, that if we are to mend the world at all, it must be through the new generation; for the old, God help it! is almost hopeless to meddle with; and in the balance of advantages, it is wiser to expend labour over a young tree, than on one which, toil as you will, you can seldom straighten out of the crookedness of years, or graft with pleasant fruit upon a long sour stem. Still, we are bound to 'dig about it and dung it,' as the good Master allows; but let us not for its sake neglect the growing trees which spring up around us on every side. Apparently, there is more hope in Ragged, Industrial, National, or even Infant Schools—in teaching establishments of every sort and kind, religious or secular—than in all our prisons, workhouses, reformatories, and penitentiaries.

The great want in this admirable movement for the benefit of the young, is its being almost exclusively on the teaching system. However varied be the instruction, and the mode in which it is imparted, the chorus of it is always 'Teach—teach—teach.'

Now, children do not need teaching every day, and all day long; any more than a tree requires perpetual watering, pruning, propping, and manuring; and Providence never meant any such thing. Set it in the ground, and let it grow. It will grow in spite of you; and the best you can do is to watch it that it grows straightly and safely—defend it from all noxious influences; but on the whole, leave it in its early season of development to the dews, and sunshine, and fresh air; and meddle with it as little as you can.

And thus we should never forget how equal with all learning, and often before it—for education can be gained in very mature life—is to children that indispensable blessing, *play*: safe, well-watched, harmless, and properly restricted, but daily play. Not doled out in ten-minute portions between hours of lessons; or according to *Miss Monfathers'* creed for 'poor' children—

In work, work, work. In work alway
Let their first years be passed—

but granted as an indispensable and very large item in their sum of existence. Poor little souls—why not? it is but a tiny sum, after all; a dozen years or so, at best. As says Christopher Sly:

Let the world wag, we shall ne'er be younger.

Perhaps even well-to-do parents scarcely think enough of this great necessity of play for their little ones, boys and girls both, up to as long a period as possible; which will be short enough with most. Alas! well do I myself remember the last evening that ever I put on my blue pinafore and 'went out to play.' Of these respectable fathers and mothers I am not now speaking; but of the fathers and mothers—not less tender and scrupulous, often—of working-people's children.

Schools are excellent things; but when a child is turned out of school, to a home which is probably only a single room, or two rooms—where labour and sickness, misery, drunkenness, or want, make it worse than no home at all—where does he go to? To play, of course; but where? In filthy alleys, making mud-pies—swimming boats along open sewers—busy at hop-scotch on pavements, or pitch-and-toss at street-corners; darting under horses' heads and carriage-wheels; exposed all day to the policeman's collaring, the errand-boy's 'whopping;' and

half the night to the foul-mouthed 'rows' which take place at gin-palace doors; open, in short, to every sort and kind of bodily harm and mental corruption.

You, fond and gentle mother, who send your children out for a walk, or into the safe garden, under the guardianship of two nursery-maids, or on wet days have them for a game in the dining-room, and at eight o'clock every night go up to kiss them in their little beds—only fancy *your* boys and girls turned out for one single day of such a life as this!

Can anything be done to remedy it?—anything which, without detracting a jot from the usefulness of schools, will provide for a want which no schools can supply?

A society, lately started, has tried to answer this question. It is called 'The Playground Society,' and its object is 'to provide playgrounds for poor children in populous places.' Its originator, a benevolent London clergyman, thus states how the scheme arose—the paragraph is taken from a private letter, which, for public good, there can be no objection to make public:

'The immediate impulse to our Society came from a little street in my late district, wherein I found a woman "blowing up" some little boys well for making a noise before her house. I entered into a conversation with her upon my wish to have a playground set apart for poor children who had no room to play at home, and must play somewhere. She replied "that the idea was a good one, because then they would not trouble *her*." Feeling, therefore, that all classes were to benefit by the movement, I began to look up friends to the cause, and a good many were found. We hope to be more useful by assisting in the conveyance of sites, than by their purchase. We do not propose to do more than procure the playground, leaving the management to local authorities.'

Therefore, the brief prospectus urges 'support from the nobility and gentry, with reference to the towns and cities contiguous to their estates;' and invites such earnestly to make 'grants of land, which can be legally conveyed for that purpose.' We feel that we are perhaps affording one chance more to a substantial public good in giving in this Journal the address of this Society—'17 Bull and Mouth Street, St Martin's-le-Grand, London.'

Thus, with a plea for playgrounds and for play, end these reminiscences of our play-days—now gone by for evermore. Yet blessed are those families, however dwindled and separated, who are bound together in heart by remembrances such as these! And blessed is the memory of those parents, who, by justice, patience, forbearance, and tenderness—tried, how sorely none find out until taught by parenthood themselves—have through all afflictions of their own given to their children that blessing, which nothing afterwards can take away, and the want of which nothing can ever supply, the recollection of a happy childhood.

SHELLEY AND HIS WRITINGS.*

FOR more than a quarter of a century, Shelley has been a sort of myth to the British public, and a myth, moreover, with two very different characters. By a few, he has been regarded as an angel, but by the majority as a sort of malignant demon, muttering perpetually necromantic incantations, to blast the tillers and the fruits of the earth. A friend who knew him well once went down to visit him while he was staying at Great Marlow. Shelley, like Rousseau, lived his whole life in the full persuasion that all mankind were habitually engaged in talking about him. After the usual civilities, he exclaimed,

* By Charles S. Middleton. 2 vols. London: Newby, 1858.

therefore, in his strange, sepulchral voice: 'Well, what do they say of me now?' The man of town replied: 'They say you are engaged in blaspheming as usual.' Shelley, evidently delighted, rejoined, in his most animated manner: 'Tell them I have run away with my grandmother—that I entertain peculiar notions about the iron railings in Lincoln's Inn Fields—and that I worship the mystery of the devil's tail!'

By talking this sort of ranting stuff, the young poet shocked a great number of persons, while he amused others. It would have been fortunate had he contented himself with shocking people's nerves in conversation only; but he delighted in doing the thing on a larger scale, and wrote several books for the same purpose. Had his life been protracted to the threescore years and ten supposed to be allotted to us for spinning speculations and sundry other duties, these fantastic tricks of youth might have been thrown completely into oblivion by the conduct and writings of his riper age; but Shelley died before public attention had been withdrawn from his intellectual frolics; and it is therefore to be feared that many generations must pass away before he can be viewed in the proper light. To hasten the consummation so devoutly to be wished, is the object of Mr Middleton's two interesting volumes.

There is nothing new in saying that a great majority of the human race are fond of indulging in severe criticisms on the few who are endowed with the remarkable powers of genius. The reason is by no means difficult to be discovered. Swift celebrates it in the following lines:

I have no title to aspire;
Yet if you sink, I seem the higher.

Without being actuated at all by this motive, we will venture to say that poor Shelley did furnish people with many strong reasons for speaking against him. He was mad occasionally, and occasionally sane; but habitually fluctuated between these two states of being, and acted wildly or outrageously simply because he could not help it. His very physical organisation suggested at once to the beholder the idea of something strange and inexplicable. He had the face and delicate figure of a girl, with light-blue eyes, fair skin, and flaxen hair, and the voice of a very old woman, cracked, broken, and tremulous. When excited, his scream was unearthly. This, whether right or wrong, was the cause why the boys delighted in tormenting him at school. It amused them to make him frantic, and they listened with a mixture of fear and wonder to the thin, weak, though infuriated voice of eld, issuing from those delicate rosy lips, which might have been expected to give birth to the softest and sweetest sounds.

It is Mr Middleton's determination to take part with Shelley in almost everything, and accordingly he is very severe upon the boys for the system of persecution they carried on at Brentford against the young poet; but we have never known any school in which so queer a little elf as Shelley then was would not have excited what Mr Middleton calls persecution. It was not the poet's fault; it was his misfortune that he was weak and timid, given to mooning about in solitude, and averse from the sports which amused and occupied the other boys. At school, as in the world, respect is paid to the possessor of power; and the only power which boys understand being that which confers victory in fighting, they could not avoid feeling a contempt for Shelley, who possessed nothing of the virtue which excited their admiration. The power that really was in him, they could not be expected to perceive. Neither could the master. He only knew by experience that he had to do with a wayward, fretful, fanciful, and unintelligible boy, who, when he should

have applied himself to his lessons, was always thinking of something else.

The same frailty of organisation led to most of the irregularities of Shelley's after-life, as well as to many of his out-of-the-way notions. He appeared to be reasoning with the world thus: 'You think because I avoid the shocks of physical force and the rough jostling of men in ordinary society, that I possess no courage. I will prove to you the contrary. I will fly in the face of public opinion; I will set at nought the notions of mankind; I will assail what they respect; I will recommend for practice what they detest; I will throw an irresistible charm around loathsome things. I will confuse—I will overthrow, and thus compel you to recognise the intrepidity of my nature.'

From the whole tenor of Shelley's career, we are convinced that this was the secret theory of his actions. By nature he was gentle and compassionate, generous, and full of charity. But he had no regulating principle in his mind; or rather, if he had, it was that overweening vanity which led him to derive supreme satisfaction from talking, thinking, and acting differently from other men. In whatever form of society he had lived, he would have selected the most unpopular opinions, and become a martyr to them. Hazlitt used to say of Coleridge that he had a knack of always preferring the unknown to the known. With Shelley, it was not the unknown, but that which was generally detested. He seemed to reason with his contemporaries as *Slender* does with *Sweet Anne Page*. 'You are afraid if you see the bears loose, are you not?' *Anne*. 'Ay, indeed, sir. *Slender*. That's meat and drink to me, now: I have seen Sackerson loose twenty times; and have taken him by the chain: but I warrant you the women have so cried and shrieked at it, that it passed.'

This was Shelley all over. He had not only seen the Sackerson of opinion loose twenty times, but had let him loose, merely that he might have the pleasure of taking him by the chain while all the world stood looking on and shrieking. But if the young poet was absurd to seek pleasure from these antics, were his contemporaries much wiser in raising such an outcry as they did? Had they ceased to scream, he would have ceased to take the bear by the chain. Any man, with a man's brains in his head, might have perceived that Shelley was a mad boy, playing with dangerous opinions, because it excited the world's attention. He was not a philosopher launching forth a new system to influence the reasonings and the thoughts of mankind for ever; but a young man of vivid imagination, rich fancy, and distorted intellect, blowing gorgeous bubbles for their entertainment. He had an instrument at his command which would occasionally discourse most elegant music, but suddenly fly off into sharps and discords, grating most harshly upon the ear. In the way of opinion, there is nothing whatever that is new in Shelley. He had groped among the ruins of the past, and picked up a number of strange ideas, which he draped fantastically after the modern fashion. It was ridiculous, therefore, to look upon him as a teacher of men. He required to be taught himself, and was only urged by the pardonable impetuosity of youth to set himself up as the antagonist of established opinions and principles. Unhappily, he found much older and graver persons ready to encourage him in the attempt to reduce his dreams to practice. Being the heir of a wealthy family, he could always, though for the time an outcast, obtain sufficient money, not only to provide for his own wants, but to give generously to others, and occasionally even to play the fool with it. We can hardly expend any great amount of pity on the pecuniary embarrassments of a young man who could make paper-boats

of fifty-pound notes, and set them floating across the Serpentine.

In the matter of ethics, Shelley's practice was not much more respectable than his theory. His conduct towards his first wife is susceptible of no defence; it was heartless and unprincipled. Of many other acts of his life we must likewise disapprove, though we are willing to give their full weight to all those circumstances which are urged by Mr Middleton in extenuation. After making all possible allowance, however, for the faults of others towards him, for the evil influences which were exerted over his mind, for the wickedness of his parents, for the pernicious counsel and example of his friends, we must still insist that Shelley's life was very far indeed from being an exemplary one. He did many kind and many noble actions—where the goods of fortune were concerned, he was in a high degree unselfish; he cheerfully underwent discomforts and privations that he might relieve the minds and the sufferings of others; he was profuse in his generosity towards his friends, and even the most complete strangers often partook of his indiscriminate bounty. Carefully considering, therefore, both the good and the evil, we are forced to the common-place conclusion that Shelley's was a mixed character—partly blamable, partly praiseworthy. The events of his life, however, were varied, strange, and interesting. He was born in a delightful part of Sussex, where, in the midst of opulence and splendour, he passed the early years of his life. But even his childhood could scarcely have been happy. Both his father and mother would appear to have been coarse, vulgar, worldly-minded individuals, no more qualified to comprehend the mind of their gifted son, than to achieve the quadrature of the circle. Even his sisters, of whom the biographer speaks kindly, may be suspected of not having been endowed with any wonderful amount of sympathy. At all events, they soon disappear from the narrative of Shelley's life, and take refuge in complete oblivion. In the selection of friends, Shelley displayed, from the commencement, very little tact or discernment—Medwin, Hogg, Godwin, Leigh Hunt, Trelawny, Byron—all were individuals more or less at war with society. At Eton, the agreeable qualities of Shelley's mind were so completely overbalanced by the disagreeable, that he made no friends, and carried away no agreeable reminiscences. At Oxford, he contracted only one friendship, that of Mr Hogg, which was obviously more prejudicial to him than otherwise. Instead of checking his tendency to what was extravagant and offensive, his new companion joined him in his vagaries, and strongly encouraged that course of study which rendered him hostile to the leading principles of his age. At the same time, it must be owned that the plan of instruction then pursued at the university was not only imperfect, but cold, dull, and mischievous. The superiors of his own college were pre-eminently unfit to be intrusted with the training and disciplining of youth. They were ignorant, harsh, ill-tempered, and bigoted; and instead of dealing gently and compassionately, as they ought, with the errors and aberrations of youth, they brought to bear against him all the fierce fanaticism of narrow minds, and expelled him from the college.

Shelley's parents, instead of receiving and consoling him, as good parents would have done, joined the hue-and-cry raised against him by his enemies. He was thus rendered an Ishmaelite, and precipitated into an interminable war with society. He became a wanderer upon the earth—married rashly, took to opium-eating, borrowed money of Jews, visited Scotland, Ireland, Wales, fought like Don Quixote with imaginary assailants, deserted his wife, and then went to sit down and read quietly at the British Museum.

At this time, he became acquainted with Godwin, whose singular character and ultra opinions possessed a powerful fascination for the young poet, who now launched forth *Queen Mab* as a sort of desperate manifesto against all the received opinions of mankind. This was the one fatal step in Shelley's literary career which inaugurated all his subsequent errors. The reader of *Gil Blas* will recollect the instructive story of Dr Sangrado. On the occasion of an epidemic at Valladolid, Gil Blas observing that his master's patients went the way of all flesh with startling rapidity, ventured one day to advise a reconsideration of his practice. 'Truly, Gil,' replied the doctor, 'the perverse alacrity of these people in dying perplexes me also not a little. But you see I have written a book in which our mode of treatment is maintained to be the best.' 'In that case,' answered Gil, 'perish all Valladolid rather than you should recant.' So, adds the historian, we went to work again; and in less than six weeks made more widows and orphans than the siege of Troy.

Like the doctor, Shelley had now written a book, and fancied that his honour was concerned to defend it. For several years, therefore, the fairy *Mab* acted like his evil genius, and betrayed him into all sorts of Quixotic enterprises. But the rich and beautiful character of his genius could not be entirely misdirected. From time to time, he produced poems of great splendour and originality; and even in the most dreary of his epics, there were passages so exquisite, so fresh, so saturated with the influences of external nature, that his worst enemies could hardly refuse to recognise their transcendent merit.

With his second wife, the daughter of Mr Godwin, Shelley now went abroad, traversed France, Switzerland, Italy, and pitched his tent at last in the sweet valley of the Arno. There, in ancient Pisa, his name is still remembered, even by the common people, who will point out to you with pleasure the house in which he dwelt under the frowning Apennine. Visible, full in front between the rocks, is that fatal blue sea in which he was destined to perish. Generally, especially in summer, it looks like a huge expanse of molten amethyst or turquoise, sleeping serenely beneath the sun. But in winter, a sudden boreas, a strong north wind, or even the Homeric sephyr, will blow it up into a chaos of spray and foam.

Here Shelley remained for a considerable time, though not without frequent removes and residences elsewhere. He passed some time on the Lake of Como, at Florence, Rome, or Naples; but generally returned in a short time to Pisa, where he loved to meditate in the shadow of the Campanile, among the ashes of the Campo Santo, or on the half-deserted Lungarno. The influence of the climate and scenery produced a pleasant change in Shelley's mind; he became less harsh, less fretful, less inclined to social Quixotism. But his imagination was diseased, and loved to revel amid the triumphs of decay and death, on the verge of moral obliquity, sin, crime, hideousness, and horror. For what was genuinely healthy in mind or body, he had no sympathy. His Parnassus was dark, and peopled with frightful phantoms; his Helicon was the black pool of melancholy; his Muses, the Eumenides, whose voices of terror howl around the criminal, as they track and chase him to his doom. During his whole life, Shelley never was happy; he had a never-failing well-spring of bitterness within. He could create gorgeous pictures; he could delight the fancy with transient scenes, beautiful as Eden; he could diffuse splendour over the desert; he could call up visions of female loveliness, and place them in gardens which rivalled the Hesperides—but

Full in the fount of joy's delicious springs,
Some bitter o'er the flowers its bubbling venom flings.

Accordingly, to follow Shelley's track through life is like reading a Greek tragedy. You always feel that there is an invisible being moving beside you, which throws its shadow over your mind. For this reason, you are never easy, never taste anything with confidence, never yield yourself up to the joyousness of the passing hour. On the contrary, you hold your breath, you look about you, you listen to catch, if possible, the stealthy steps of Nemesis, as she approaches from behind. Whether you hear them or not, you know she is there, watching you everlastingly, and as you raise the goblet to your lips, ready to strike you down in the midst of your pleasures. By a species of second-sight, you look forward, and behold the boat upon the gulf, the thick evening clouds, the mounting waves; and then, upon the sea-shore, a knot of friends about a funeral-pile, and an urn, filled with ashes and burned bones.

Mr Middleton, through strong admiration for Shelley and his writings, has become an advocate and apologist. He tells the poet's story interestingly and well; he attacks his enemies with vehemence, and shows all his actions and his friends in the best possible light. This renders his volumes very agreeable to read, but we are by no means disposed to accept all his conclusions. In the matter of opinion, he proves, we think, clearly enough, that Shelley, ere he died, was passing through that phase of intellectual existence, so admirably described by a Roman poet, and not badly interpreted by an Englishman:

A fugitive from heaven and prayer,
I mocked at all religious fear,
Deep scienced in the mazy lore
Of mad philosophy. But now
Hoist sail, and back my voyage plough
To that blest harbour which I left before.

Great instruction may be derived from an attentive study of Shelley's life. That he possessed genius of a very high order, no one, we fancy, will be inclined to dispute. It seems to be equally clear that he was gifted with many excellent qualities—that he was benevolent, charitable, a lover of knowledge, and a lover of freedom. What, then, did he want to render him happy himself, and a source of happiness to others? Common sense. He partook of an opinion very widely diffused in modern times, that genius is not amenable to the laws which regulate the proceedings of ordinary individuals. An acquaintance with the history of literature might have taught him to think differently. The greatest intellectual powers ever ingrafted upon human nature have claimed no exemption for themselves from the common duties and observances of life. Shakespeare and Milton, Æschylus and Homer, breathe throughout their writings obedience to the great universal code of ethics which we must allow to guide our conduct, if we would taste of happiness. A man, whatever may be his poetical faculties, can never be contemplated as merely a poet: he is the citizen of some state, he is the son of some father, he is the husband of some wife, he is the father of some children; he has friends, he has acquaintances, he has contemporaries in literature, he has competitors for fame. In all these relations, he has duties to perform, and must perform them, or make up his account to be unhappy. If Shelley's whole career be examined, he will be found to have performed scarcely one duty as he ought. If his parents were bad, it will hardly be contended that, making all due allowance for that circumstance, he was a good son. He certainly was not a good husband, or a good father. What he was as a brother, we hardly know; but, if we must draw any inference at all, it is, that he was by no means exemplary. Towards his friends, he seemed always to have behaved generously, and, for the most part, much

better than they deserved, because the cardinal error of his life was the choice of those very friends. He should have borne in mind the immemorial adage: 'Shew me your familiars, and I will tell you what you are.' To say the best, there was not one of them desirable. To the poor, Shelley invariably behaved with kindness and sympathy. He felt keenly for misfortune, and detested oppression of all kinds. He was ready at any hour of the day or night to sally forth and make sacrifices and succour the needy. Upon this point, Mr Middleton very properly insists, as it ought to be taken into account when we are drawing up our estimate of Shelley's character. His works, however, and his life are now before us, and whatever may be the design with which we sit down to examine them, we shall be inevitably influenced by our own idiosyncrasies. The fanciful and imaginative will be inclined to be lenient; the affectionate, the impassioned, the impetuous, will probably condemn; the calm and philosophical will award a portion of blame and praise, according to the quality of the actions and writings they review. But friends and enemies, admirers and detractors, the poetical and the unpoetical, must acknowledge that his life was singularly checkered, strange, and full of vicissitudes. From the cradle to the grave, he was in perpetual troubles, difficulties, embarrassments, misfortunes, dangers, and his existence was at last terminated by a fierce and pitiless storm.

OCEOLA:

A ROMANCE.

CHAPTER XXIV.—A PRETTY PLOT.

To dispute the identity was to doubt the evidence of my senses. The mulatto was before me—just as I remembered him—though with changed apparel, and perhaps grown a little bigger in body. But the features were the same—the *tout ensemble* the same, as that presented by Yellow Jake, the *ci devant* woodman of our plantation.

And yet how could it possibly be he? And in the company of Arens Ringgold too, one of the most active of his intended executioners? No, no, no! altogether improbable—utterly impossible! Then must I be deluded—my eyes deceiving me—for as certain as I looked upon man, I was looking upon Jake the mulatto! He was not twenty feet from where I lay hidden; his face was full towards me; the moon was shining upon it with a brilliancy scarcely inferior to the light of day. I could note the old expression of evil in his eyes, and mark the play of his features. It was Yellow Jake.

To confirm the impression, I remembered that, notwithstanding all remonstrance and ridicule, the black pertinaciously adhered to his story. He would listen to no compromise, no hypothesis founded upon resemblance. He had seen Yellow Jake, or his ghost. This was his firm belief, and I had been unable to shake it.

Another circumstance I now remembered: the strange behaviour of the Ringolds during the post-prandial conversation—the action of Arens when I mentioned the mulatto's name. It had attracted my attention at the time, but what was I to think now? Here was a man supposed to be dead, in company of three others who had been active in assisting at his death—one of them the very keenest of his executioners, and all four now apparently as thick as thieves! How was I to explain, in one moment, this wonderful resurrection and reconciliation?

I could not explain it—it was too complicated a mystery to be unravelled by a moment's reflection; and I should have failed, had not the parties themselves soon after aided me to an elucidation.

I had arrived at the only natural conclusion, and this was, that the mulatto, notwithstanding the perfect resemblance, *could not be* Yellow Jake. This, of course, would account for everything, after a manner; and had the four men gone away without parley, I should have contented myself with this hypothesis.

But they went not, until after affording me an opportunity of overhearing a conversation, which gave me to know, that, not only was Yellow Jake *still in the land of the living*, but that Haj-Ewa had spoken the truth, when she told me *my life was in danger*.

'D—! he's not here, and yet where can he have gone?'

The ejaculation and interrogative were in the voice of Arens Ringgold, uttered in a tone of peevish surprise. Some one was sought for by the party who could not be found. Who that was, the next speaker made manifest.

There was a pause, and then reached my ears the voice of Bill Williams—which I easily recognised, from having heard it but the day before.

'You are sartint, Master Arens, he didn't sneak back to the fort 'long wi' the ginral?'

'Sure of it,' replied 'Master Arens; 'I was by the gate as they came in. There was only the two—the general and the commissioner. But the question is, did he leave the hommock along with them? There's where we played devil's fool with the business—in not getting here in time, and watching them as they left. But who'd have thought he was going to stay behind them; if I had only known that—' You say,' he continued, turning to the mulatto—'you say, *Jake*, you came direct from the Indian camp? He couldn't have passed you on the path.'

'*Carajo! Señor Aren!* No!'

The voice, the old Spanish expression of profanity, just as I had heard them in my youth. If there had been doubt of the identity, it was gone. The testimony of my ears confirmed that of my eyes. The speaker was Yellow Jake.

'Straight from Seminole come. Cat no pass me on the road; I see her. Two chiefs me meet. I hide under the palmettoes; they no me see. *Carrambo!* no.'

'Deuce take it! where can he have gone? There's no signs of him here. I know he *might have a reason* for paying a visit to the Indians—that I know; but how has he got round there without Jake seeing him?'

'What's to hinder him to hev goerd round the tother road?'

'By the open plain?'

'Yes—that away.'

'No—he would not be likely. There's only one way I can explain it: he must have come as far as the gate along with the general, and then kept down the stockade, and past the sutler's house—that's likely enough.'

This was said by Ringgold in a sort of half-soliloquy.

'Devils!' he exclaimed in an impatient tone, 'we'll not get such a chance soon again.'

'Ne'er a fear, Master Arens,' said Williams—'ne'er a fear. Plenty o' chances, I kalkerlate—gobs o' chances sech times as these.'

'We'll make chances,' pithily added Spence, who now spoke for the first time in my hearing.

'Ay, but here was a chance for *Jake*—he must do it, boys; neither of you must have a hand in it. It *might leak out*; and then we'd all be in a pretty pickle. *Jake* can do it, and not harm himself, for *he's dead*, you know, and the law can't reach him! Isn't it so, my yellow boy?'

'*Carrambo! si, señor.* No fear have, Don Aren Ringgol; 'fore long, I oppourtuny find. *Jake* you get

rid of enemy—never hear more of him; soon Yellow *Jake* good chance have. Yesterday miss. She bad gun, Don Aren—not worth shuck gun.'

'He has not yet returned inside the fort,' remarked Ringgold, again speaking in a half-soliloquy. 'I think he has not. If no, then he should be at the camp. He must go back to-night. It may be after the moon goes down. He must cross the open ground in the darkness. You hear, *Jake*, what I am saying?'

'Si, señor; *Jake* hear all.'

'And you know how to profit by the hint, eh?'

'*Carrambo!* si, señor. *Jake* know.'

'Well, then, we must return. Hear me, *Jake*—if'—

Here the voice of the speaker fell into a half-whisper, and I could not hear what was said. Occasionally there were phrases muttered so loudly that I could catch their sound, and from what had already transpired, was enabled to apprehend something of their signification. I heard frequently pronounced the names of Viola the quadroon, and that of my own sister; the phrases—'only one that stands in our way'—'mother easily consent'—'when I am master of the plantation'—'pay you two hundred dollars.'

These, with others of like import, satisfied me that between the two fiends some contract for the taking of my life had already been formed; and that this muttered dialogue was only a repetition of the terms of the hideous bargain!

No wonder that the cold sweat was oozing from my temples, and standing in bead-like drops upon my brow. No wonder that I sat upon my perch shaking like an aspen—far less with fear than with horror at the contemplated crime—absolute horror. I might have trembled in a greater degree, but that my nerves were to some extent stayed by the terrible indignation that was swelling up within my bosom.

I had sufficient command of my temper to remain silent; it was prudent I did so; had I discovered myself at that moment, I should never have left the ground alive. I felt certain of this, and took care to make no noise that might betray my presence.

And yet it was hard to hear four men coolly conspiring against one's life—plotting and bargaining it away like a piece of merchandise—each expecting some profit from the speculation!

My wrath was as powerful as my fears—almost too strong for prudence. There were four of them, all armed. I had sword and pistols; but this would not have made me a match for four desperadoes such as they. Had there been only two of them—only Ringgold and the mulatto—so desperate was my indignation, at that moment, I should have leaped from the tree and risked the encounter, *côte qui côte*.

But I disobeyed the promptings of passion, and remained silent till they had moved away.

I observed that Ringgold and his brace of bullies went towards the fort, while the mulatto took the direction of the Indian camp.

CHAPTER XXXV.

LIGHT AFTER DARKNESS.

I stirred not till they were gone—till long after. In fact, my mind was in a state of bewilderment, that for some moments hindered me either from acting or thinking; and I sat as if glued to the branch. Reflection came at length, and I began to speculate upon what I had just heard and seen.

Was it a farce to frighten me? No, no—they were not the characters for a farce—not one of the four; and the reappearance of Yellow Jake, partaking as it did of the wild and supernatural, was too dramatic, too serious to form an episode in comedy.

On the contrary, I had just listened to the prologue

of an intended tragedy, of which I was myself to be the victim. Beyond doubt, these men had a design upon my life!

Four men, too, not one of whom could charge me with ever having done him a serious injury. I knew that all four disliked me, and ever had—though Spence and Williams could have no other cause of offence than what might spring from boyish grudge—long forgotten by me; but doubtless their motive was Ringgold's. As for the mulatto, I could understand his hostility; though mistaken, it was of the deadliest kind.

But what was I to think of Arens Ringgold, the leader in this designed assassination? A man of some education—my equal in social rank—a gentleman!

O Arens Ringgold—Arens Ringgold! How was I to explain it? How account for conduct so atrocious, so fiendish?

I knew that this young man liked me but little—of late, less than ever. I knew the cause too. I stood in the way of his relations with my sister—at least so thought he. And he had reason; for, since my father's death, I had spoken more freely of family affairs. I had openly declared that, with my consent, he should never be my brother; and this declaration had reached him. I could easily believe, therefore, that he was angry with me; but anger that would impel a man to such demoniac purpose, I could not comprehend.

And what meant those half-heard phrases—'one that stands in our way,' 'mother easily consent,' 'master of the plantation,' coupled with the names of Viola and my sister? What meant they?

I could give them but one, and that a terrible interpretation—too fearful to dwell upon.

I could scarcely credit my senses, scarcely believe that I was not labouring under some horrid hallucination, some confusion of the brain produced by my having been *en rapport* with the maniac!

But no; the moon had been over them—my eyes upon them—my ears open, and could not have deceived me. I saw what they did—I heard what they said. They designed to kill me!

'Ho, ho, young mico, you may come down. The *honowaw-hulwa** are gone. *Hinklas!* Come down, pretty mico—down, down, down!'

I hastened to obey, and stood once more in the presence of the mad queen.

'Now you believe Haj-Ewa? Have an enemy, young mico? Ho—four enemies. Your life in danger? Ho? ho?'

'Ewa, you have saved my life; how am I to thank you for the service you have done me?'

'Be true to her—true—true—true.'

'To whom?'

'Great Spirit! he has forgotten her! False young mico! false pale-face! Why did I save him? Why did I not let his blood fall to the ground?'

'Ewa!'

'*Hulwak, hulwak!* Poor forest-bird! the beauty-bird of all; her heart will sicken and die, her head will go mad.'

'Ewa, explain.'

'*Hulwak!* better he should die than desert her. Ho, ho! false pale-face, would that he had died before he broke poor Ewa's heart; then Ewa would have lost only her heart; but her head—her head, that is worse. Ho, ho, ho!

Why did I trust in a pale-faced lover?

Ho, ho, ho!

Why did I meet him?—

'Ewa,' I exclaimed with an earnestness that caused

the woman to leave off her wild song, 'tell me! of whom do you speak?'

'Great Spirit, hear what he asks! Of whom?—of whom? there is more than one. Ho, ho! there is more than one, and the true one forgotten. *Hulwak, hulwak!* What shall Ewa say? What tale can Ewa tell? Poor bird! her heart will bleed, and her brain be crushed. Ho, ho! There will be two Haj-Ewas—two mad queens of the Micosauca.'

'For heaven's sake! keep me not in suspense. Tell me, Ewa, good Ewa, of whom are you speaking? Is it?—'

The name trembled upon my tongue; I hesitated to pronounce it. Notwithstanding that my heart was full of delightful hope, from the confidence I felt of receiving an affirmative answer, I dreaded to put the question.

Not a great while did I hesitate; I had gone too far to recede. I had long waited to satisfy the wish of a yearning heart; I could wait no longer. Ewa might give me the satisfaction. I pronounced the words:

'Is it—Maïmee?'

The maniac gazed upon me for some moments without speaking. The expression of her eye I could not read; for the last few minutes, it had been one of reproach and scorn. As I uttered the name, it changed to a look of bewilderment; and then her glance became fixed upon me, as if searching my thoughts.

'If it be Maïmee,' I continued, without awaiting her reply—for I was now carried away by the ardour of my resuscitated passion—'if it be she, know, Ewa, that her I love—Maïmee I love.'

'You love Maïmee? You still love Maïmee?' interrogated the maniac with startling quickness.

'Ay, Ewa—by my life—by my!—'

'*Cooree, cooree!* swear not—his very oath. *Hulwak!* and lie was false. Speak again, young mico! say you love Maïmee—say you are true, but do not swear.'

'True—true!'

'*Hinklas!*' cried the woman in a loud, and apparently joyful tone—'*Hinklas!* the mico is true—the pretty pale-faced mico is true, and the *haintchitz** will be happy.'

Ho, ho!

Now for the love, the sweet young love

Under the *tala*† tree.

Who would not be like yonder dove—

The wild little dove—

The soft little dove—

Sitting close by his mate in the shade of the grove—

Co-cooing to his mate in the shade of the grove,

With none to hear or see?

'Down, *chitta mico!*' she exclaimed, once more addressing the rattlesnake; 'and you, *ocola chitta*!‡ Be quiet both. It is not an enemy. Quiet, or I crush your heads!'

'Good Ewa!—'

'Ho! you call me good Ewa. Some day, you may call me bad Ewa. Hear me!' she continued, raising her voice, and speaking with increased earnestness—'hear me, George Randolph! If ever you are bad—false like him, like him, then Haj-Ewa will be your enemy; the *chitta mico* will destroy you. You will, my king of serpents? you will? Ho, ho, ho!'

As she spoke, the reptile appeared to comprehend her, for its head was suddenly raised aloft, its bright basilisk eyes gleamed as though emitting sparks of fire—its forked, glittering tongue was protruded from its mouth, and the 'skir-rr' of its rattles could be heard for some moments sounding continuously.

* The pretty one.

† Palm (*Chamærops palmetto*).

‡ Green snake.

* Bad men.

'Quiet! now quiet!' said she, with a motion of her fingers, causing the serpent to resume its attitude of repose. 'Not he, *chitta*! not he, thou king of the crawlers! Quiet, I say!'

'Why do you threaten me, Ewa? You have no cause.'

'*Hinklas*! I believe it, fair mico, gallant mico; true, I believe it.'

'But, good Ewa, explain to me—tell me of'—

'*Coores, coores!* not now—not to-night. There is no time, *chepawnee*! See! look yonder to the west! *Netle-hasse** is going to bed. You must be gone. You dare not walk in the darkness. You must get back to the *topokes* before the moon is hid—Go, go, go!'

'But I told you, Ewa, I had business here. I dare not leave till it is done.'

'*Hulwak*! there is danger then. What business, mico? Ah! I guess. See! they come for whom you wait?'

'True—it is they, I believe.'

I said this, as I perceived the tall shadows of the two chiefs flitting along the further edge of the pond.

'Be quick, then: do what you must, but waste not time. In the darkness, you will meet danger. Haj-Ewa must be gone. Good-night, young mico; good-night!'

I returned the salutation; and facing round to await the arrival of the chiefs, lost sight of my strange companion.

The Indians soon came upon the ground, and briefly delivered their report.

Holats Mico had struck his tents, and was moving away from the encampment.

I was too much disgusted with these traitorous men to spend a moment in their company; and, as soon as I had gained the required information, I hurried away from their presence.

Warned by Haj-Ewa, as well as by the words of Arens Ringgold, I lost no time in returning to the fort. The moon was still above the horizon; and I had the advantage of her light to protect me from being surprised by any sudden onset.

I walked hastily, taking the precaution to keep in the open ground, and giving a wide berth to any covert that might shelter an assassin.

I saw no one on the way, nor around the back of the stockade. On arriving opposite the gate of the fort, however, I perceived the figure of a man—not far from the sutler's store—apparently skulking behind some logs. I fancied I knew the man; I fancied he was the mulatto.

I would have gone after him, and satisfied myself; but I had already hailed the sentinel, and given the countersign; and I did not desire to cause a flurry among the guard—particularly as I had received injunctions to pass in as privately as possible.

Another time, I should likely encounter this Jacob *redivivus*; when I should be less embarrassed, and perhaps have a better opportunity of calling him and his diabolical associates to an account. With this reflection, I passed through the gate, and carried my report to the quarters of the commander-in-chief.

CHAPTER XXXVI.

IN NEED OF A FRIEND.

To pass the night under the same roof with the man who intends to murder you is anything but pleasant, and repose under the circumstances is next to impossible. I slept but little, and the little sleep I did obtain was not tranquil.

* The night-sun—the moon.

Before retiring for the night, I had seen nothing of the Ringgolds, neither father nor son; but I knew they were still in the fort, where they were to remain as guests a day or two longer. They had either gone to bed before my return, or were entertained in the quarters of some friendly officer. At all events, they did not appear to me during the remainder of that night.

Neither saw I aught of Spence and Williams. These worthies, if in the fort, would find a lodgment among the soldiers, but I did not seek them.

Most of the night I lay awake, pondering on the strange incidents of the day, or rather upon that one episode that had made me acquainted with such deadly enemies.

I was in a state of sad perplexity as to what course I should pursue—uncertain all night long; and when daylight shone through the shutters, still uncertain.

My first impulse had been to disclose the whole affair at head-quarters, and demand an investigation—a punishment.

On reflection, this course would not do. What proofs could I offer of so grave an accusation? Only my own assertions, unbacked by any other evidence—unsustained even by probability—for who would have given credence to crime so unparalleled in atrocity?

Though certain the assassins referred to me, I could not assert that they had even mentioned my name. My story would be treated with ridicule, myself perhaps with something worse. The Ringgolds were mighty men—personal friends both of the general and commissioner—and though known to be a little scoundrelly and unscrupulous in worldly affairs, still holding the rank of gentlemen. It would need better evidence than I could offer to prove Arens Ringgold a would-be murderer.

I saw the difficulty, and kept my secret.

Another plan appeared more feasible—to accuse Arens Ringgold openly before all, and challenge him to mortal combat. This, at least, would prove that I was sincere in my allegations.

But duelling was against the laws of the service. It would require some management to keep clear of an arrest—which of course would frustrate the scheme before satisfaction could be obtained. I had my own thoughts about Master Arens Ringgold. I knew his courage was but slippery. He would be likely enough to play the poltroon; but whether so or not, the charge and challenge would go some way towards exposing him.

I had almost decided on adopting this course, though it was morning before I had come to any determination.

I stood sadly in need of a friend; not merely a second—for this I could easily procure—but a besom-companion in whom I could confide, and who might aid me by his counsel. As ill-luck would have it, every officer in the fort was a perfect stranger to me. With the Ringgolds alone had I any previous acquaintance.

In my dilemma, I thought of one whose advice might stand me in good stead, and I determined to seek it. Black Jake was the man—he should be my counsellor.

Shortly after daylight the brave fellow was by my side. I told him all. He appeared very little surprised. Some suspicion of such a plot had already taken possession of his mind, and it was his intention to have revealed it to me that very morning. Least of all did he express surprise about Yellow Jake. That was but the confirmation of a belief, which he entertained already, without the shadow of a doubt. He knew positively that the mulatto was living—still more, he had ascertained the mode by which the latter had made his almost miraculous escape.

And yet it was simple enough. The alligator had seized him, as was supposed; but the fellow had the adroitness to 'job' its eyes with the knife, and thus cause it to let go its hold. He had followed the example of the young Indian, using the same weapon!

This occurred under water, for the mulatto was a good diver. His limbs were lacerated—hence the blood—but the wounds did not signify, nor did they hinder him from making further efforts to escape.

He took care not to rise to the surface until after swimming under the bank; there, concealed by the drooping branches, he had glided out, and climbed up into a live-oak—where the moss sheltered him from the eyes of his vengeful pursuers. Being entirely naked, there was no sign left by dripping garments, to betray him; besides, the blood upon the water had proved his friend. On seeing that, the hunters were under the full belief that he had 'gone under,' and therefore took but little pains to search further.

Such was Black Jake's account of this affair. He had obtained it the evening before from one of the friendly Indians at the fort, who professed to have the narration from the mulatto's own lips.

There was nothing improbable in the story, but the contrary. In all likelihood, it was strictly true; and it at once dispersed the half-dozen mysteries that had gathered in my mind.

The black had received other information. The runaway had taken refuge with one of the half-negro tribes established amid the swamps that envelop the head waters of the Amazura. He had found favour among his new associates, had risen to be a chief, and now passed under the cognomen of the 'Mulatto-mico.'

There was still a little mystery: how came he and Arens Ringgold in 'caboot'?

After all, there was not much puzzle in the matter. The planter had no particular cause for hating the runaway. His activity during the scene of the baffled execution was all a sham. The mulatto had more reason for resentment; but the loves or hates of such men are easily set aside—where self-interest interferes—and can, at any time, be committed for gold.

No doubt, the white villain had found the yellow one of service in some base undertaking, and vice versa. At all events, it was evident that the 'hatchet had been buried' between them, and their present relations were upon the most friendly footing.

'Jake' said I, coming to the point on which I desired to hear his opinion, 'what about Arens Ringgold—shall I call him out?'

'Golly, Masser George, he am out long 'go—I see um 'bout dis two hour an' more—daat ar bossy don't sleep berry sound—he hant got da good conscience, I reck'n.'

'Oh! that is not what I mean, my man.'

'Wha—what masser mean?'

'To call him out—challenge him to fight me.'

'Whugh! masser, d' you mean say a dewel ob sword an' pistol?'

'Swords, pistols, or rifles—I care not which weapon he may choose.'

'Gorramity! Masser George, don't talk ob sech a thing. O Lordy! no—you hab moder—you hab sister. 'Spouse you get kill—who know—the bullock he sometime kill tha butcha—den, Masser George, no one lef—who lef take care ob ya moder—who be guardum ob ya sister Vagin? who 'tect Viola—who 'tect all ob us from dese bad bad men? Gorramity! masser, let um 'lone—doant call 'im out!'

At that moment, I was myself called out. The earnest appeal was interrupted by the braying of bugles and the rolling of drums, announcing the

assembly of the council; and without waiting to reply to the disinterested remonstrance of my companion, I hastened to the scene of my duties.

BIRTHS, DEATHS, AND MARRIAGES.

Most people know that there is an organisation existing throughout England and Wales for the purpose of recording the births, deaths, and marriages of the population; but few are aware how extensive and elaborate it is. We purpose in this paper to give some description of its machinery, more particularly so far as the central controlling office at Somerset House is concerned.

Previously to the year 1837, the business of registration was chiefly in the hands of the clergy, or rather of the parish-clerks; and a pretty business they appear to have made of it. They did not profess to record births and deaths, but only baptisms and burials; so that the system was imperfect in theory, but ten times more so in practice. It is a curious thing that the civil duties of religious bodies have nearly always been bunglingly performed; and nowhere is this more apparent than in the parish registers. The parochial officials, to whom they were generally intrusted, were for the most part illiterate men, with a very grand idea, no doubt, of the magnitude of their own office, and of beadedom and bumbledom generally, but with a very vague notion of the importance of the documents committed to their charge. Alterations, erasures, and interlineations, to suit the convenience of interested persons, were of no uncommon occurrence, and are traceable, like many other crimes, not so much to a distinct determination to do wrong under a full sense of the enormity of the offence, as to a drowsy inapprehension that any great violation of the law is being committed. We remember hearing that on one occasion in a borough in one of the eastern counties, there was a violently contested election, and every vote was of importance. Now, it so happened that the choice of a member rested with those who possessed the freedom of the town. This freedom could be obtained in various ways. Persons who married the daughters of freemen were considered as freemen themselves; and numbers of poor women were married in order to qualify their husbands, who voted as soon as the ceremony was concluded. It was also at that time the law that a man could take up his freedom from his grandfather, and it consequently became necessary for a certain person, whom we will call George Smith, to prove that his grandfather, whose name was Thomas Smith, was born in the parish. On searching the registers at the church, no Thomas Smith could be found; but on further search, the name of John Smith was discovered. This was of no avail; and the great cause represented by the worthy aspirant to parliamentary honours for the borough of M— was likely to lose a supporter, when the parish-clerk soon settled the difficulty by pulling out his penknife, altering John into Thomas, and giving his certificate to the man, who forthwith went and voted.

Since the year 1837, all this has been altered; and the whole business has been placed by act of parliament in the hands of the registrars of births, deaths, and marriages, who are controlled by the registrar-general in London.

It is the duty of the registrars of births and deaths to register these events as they occur; and it is the duty of the registrars of marriages to be present at and record every marriage which takes place amongst the dissenters, Jews and Quakers alone excepted, for whom provision is made by a special enactment. It might be supposed that the duties of the registrar-general were of a very subordinate character: nothing of the sort.

He has to see that the act of parliament is properly carried out, that the registers are properly kept, that all discoverable errors are corrected, and that the whole of the vast returns made to him are properly indexed and arranged in volumes. His establishment consists of nearly seventy persons, who are divided into the various classes of superintendents, travelling inspectors, senior, assistant, and junior clerks, transcribers, indexers, sorters, and messengers. These are distributed into four departments, to which are respectively intrusted the care of the records, the compilation of statistics, the issuing of the books and forms, together with part of the correspondence, and the management of the accounts. Each of these departments is under the control of one or two superintendents, while the chief clerk acts as general secretary. At the close of each quarter, the registrars throughout the country make out copies of all the births, deaths, and marriages which they have registered; and collect from the clergymen copies of the various entries in the register-books of the different churches. These are then transmitted to the superintendent registrars of the respective districts, who examine them so far as the births, deaths, and dissenting marriages are concerned, and finally transmit them to the registrar-general. On their arrival, they are carefully arranged in volumes, indexed and paged. Now comes one of the most arduous duties surely that was ever committed to mortal clerk: all these volumes are carefully examined by seven clerks, who do nothing else all the livelong day but microscopically inspect these sheets to see whether all the forms of the act of parliament are complied with, and whether or not there are internal discrepancies which shew that any entry of a birth, death, or marriage is imperfect or invalid. In each entry there may be twenty or thirty blunders arising from nonconformity with regulations, besides all those which have their origin in ignorance or bad writing. Consequently, every record of a birth or death—and there are more than a million persons in England who are either born, married, or die in the course of a year—has to be regarded from all these points. All day long do these seven gentlemen sit at their posts investigating whether Alfred Jones is truly and properly described as the son of Thomas Jones, and not as the son of Thomas Junea, or some other equally mythical personage; whether Timothy Smith is dignified with the title of boy, and not, as is too frequently the case, unsexed by the careless registrar, who describes him as girl; whether the poor thing, by an unpardonable substitution of March for February, is not described as having been born after he was registered—besides a thousand other questions which turn upon the construction of the act of parliament and the various regulations founded upon it. The great enemies of these seven examiners and the registrar-general are imperfect 'e's' which look like 'r's,' 'n's' which look like 'u's,' and decapitated 'o's' metamorphosed likewise into 'u's.' These little trifles appear at first sight of no consequence; but when it is recollected that by a slight touch of the pen, instead of asserting that the Lady Blanche did, on the 12th instant, give birth to a pretty Rose, you affirm to her great horror that she did give birth to a Nose, which Nose henceforward appears in the index amongst the Noses, and not amongst the Roses, you will see that these gentlemen cannot well attach too much importance to clear caligraphy. We should scarcely be surprised if, occupied as they are in judging men according to their capacity of forming 'u's' like 'u's,' and not like 'o's,' they were to make it the test as to whether a man ought to have a vote: 'Does he join the two sides of his "o's"?'

All sorts of revelations are unfolded by these registers—some pathetic, some ridiculous. Name after

name alike, down a page of deaths, shews a whole family swept off by some epidemic. Signature after signature of the coroner, shews a ravaging colliery explosion or a shipwreck. Here is a poor child named Alpha Omega—on looking closely, you see that it is illegitimate—First and Last the mother calls it, recording her repentance on the brow of her offspring. No names are too absurd for parents to give their children. Here are innocents stamped for life as Kidnum Toats, Lavender Marjoram, Patient Pipe, Tabitha Cumi, Fussy Gotobed, and, strangest of all, here is one called Eli Lama Sabachthani Pressnail! Other parents are more ambitious, and prematurely ennoble their children by designating them Lord, Earl, Princess Charlotte, &c.; whilst, during the Russian war, numbers of poor things were labelled Malakoff, Sebastopol, Redan, Inkermann, and Balaklava. Florence Nightingale, however, seems to have been the greatest favourite, especially amongst the poor, who have shewn their admiration for her by perpetuating her name in their families all over the country. The returns for the last two years would shew that Florence has become a much commoner name lately. Some of the marriage registers are curious. The greatest extremes of age—seventy and seventeen—are often found to unite in matrimony. Occasionally we see an entry only half completed, and a note to this effect: 'Ceremony begun, but not finished, the marriage being broken off;' or, 'Bridegroom so drunk that the marriage could not proceed.' If people's names are any index to their characters, the most extraordinary union of qualities often appears to take place. 'Friend' marries a woman named 'Amor'; a 'Lamb' before marriage, becomes a 'Lion' after; a 'Nightingale' marries a 'Partridge'; 'Mutton' takes 'Ham'; 'Salmon,' 'Codd,' &c. Some of the mistakes which the registrars make with the causes of death are rather remarkable. People are discovered to die of the following strange complaints, most of which are probably new to our medical readers: 'Imperfect closure of the foreman,' 'Turner on the right anse,' 'Disease of the lever,' 'Hanged himself in a fit of temperate insanity from excessive drinking,' &c.

All the errors discovered by the examiners, are noted on proper forms, which are sent to the clerk, who writes to the registrars respecting the different mistakes. The average number of errors discovered each quarter may be between three and four thousand, so that the correspondence necessary to point them out and give instructions for their correction, is no easy matter: of course, great assistance is obtained by means of printed forms, each of which applies to a certain class of error. To write a special letter on each case would be absolutely impossible. About one hundred and thirty different printed circulars are used, and it is found that even these do not include every description of blunder. The registrars are not allowed to make any alteration in an entry when it is once completed, so that a correction can be effected only by means of a note in the margin. Neither are they allowed, except in certain cases, to alter the copies which are once delivered to the office. A fresh copy of every entry which is corrected must be transmitted to Somerset House, and there it is placed in a supplement, which is almost a kind of hospital for entries; for although most of those which are there imprisoned are good, sound, and able to do service, yet the majority at some time or other have had their limbs set, or have been otherwise tinkered. Some are so hopelessly bad, that nothing but a feeling of compassion prevents their existence being terminated by speedy cancellation. Four clerks are constantly occupied in instructing the registrars how to place these poor fractured entries on their legs again, while another sees that, when in a state of convalescence, they are comfortably

deposited for the rest of their lives in the institution appropriated to them, instead of mixing with their more capable companions. The mass of writing necessary in order to conduct all this correspondence and the other business of the office, may be estimated from the fact, that the annual expense of postage reaches the enormous sum of £6000 a year. Every mistake which is discovered in the returns is carefully entered in a large kind of ledger to the account of the man by whom it was made. There will be found a complete record of all his official delinquencies—how many times he has wilfully left out his dots to his 'i's' and crosses to his 'r's,' and otherwise neglected his duties. After the sheets are dismissed by the examiners, they are bound up, and sent to the transcribers, who copy out the name and surname in each entry, together with the district, volume, and page in which it is to be found, on sheets of paper, which are afterwards cut into slips. These slips are then sorted into alphabetical order, and so copied into large parchment indexes. After this, the volumes pass into the hands of the statistical department, who eliminate from them all those manifold results which appear in the registrar-general's quarterly and annual Reports. Magnificent theories to be evolved respecting population and disease lie here only waiting, like those that were to be deduced from the collection of errata by Jean Paul's parson, for some one to deduce them. But it is a mistake to suppose that no practical results have been obtained. Many of the zealous inquirers in cholera and epidemic times have had light thrown upon the subject by these tables. Thence we see that mortality increases in inverse proportion to the purity of the water-supply and the height of the district above the sea. It is a fact, though, that the law of elevation which Dr Farr has shewn, other things being equal, to regulate the cholera, was noticed by Procopius more than thirteen hundred years ago, as characteristic of the plague which devastated Constantinople.

After having passed through these various manipulations, the volumes are finally entombed in the vaults, so as to be easily accessible to the public at large. Here lies the real history of the English people for the last twenty years. My history's epochs are my birth, my marriage, and the memorable days when Tom and Jack, Susan and Jane, came into the world and gathered round me. The history of the nation may be in Macaulay or in the columns of the *Times*, but the history of the people is in the registrar-general's vaults at Somerset House.

MY THIEF.

Yes, respected reader, my thief! Your eyes have not deceived you, and there is no glamour on the page, no talisman but the type, no spells but the compositor's, no black art except the printer's.

My thief! I, I the writer of this confession, and the reader's very humble servant, once kept, harboured, and maintained a light-fingered, soft-treading, slippery conveyancer, who would have taken honours in Rat's Castle, and becomingly graduated at the Central Criminal Court. Having volunteered such a statement as the above, I feel it due to my reputation, to use a parliamentary form of speech, to vindicate the character which, I cannot doubt, is already painted in sufficiently dark hues by the fancy of those who may peruse these lines.

I'll warrant me, now, good friend, that you have already sketched for me an uglier portrait than even cheap photography, in its most malignant mood, could inflict upon a suffering world.

You imagine me a member of the reputable tribe of 'fences,' some hook-nosed, greasy-bearded individual, with a shining yellow face, goggle eyes, three napless hats on his head, and a class of youngsters under his tutelage, to be trained for the station-house, the hulks, and the gallows.

You never made a worse guess in your life.

At the period to which my present admissions refer, instead of being surrounded by the squalid hovels, flaunting gin-shops, and all the seething caldrons of blended guilt and misery which form the natural abode of a resetter of thieves, I dwelt in a highly respectable bungalow, clean and trim as bamboo-thatch and whitewash could make it, and encircled by a 'compound' or homestead, that contained four such giant palms, with Titanic trunks and feathery branches, as the untraveller hath not beheld, no, not even in his dreams.

Instead of a patched wrap-rascal and nailed high-lows, I wore the red coat and epaulets of the Company's regular infantry when on duty, and a sort of planter's suit of white linen when off it—no bad exchange when the hot winds are blowing, and the thermometer keeps steadily at ninety of Fahrenheit, except when it rises to a hundred. In short, I was one of those officers whom irreverent guardsmen on the shady side of Pall Mall are wont to speak of as 'Quy Hys.' Yet I kept a thief!

To be sure, many an Anglo-Indian might say that he did the same, not in one, nor two, but in a dozen instances. Lucky, indeed, is the oriental resident whose score of servants all deserve a certificate of unimpeachable honesty; lucky he whose khansamah is not a rogue, and whose bearers never indulge their supple fingers in the luxury of picking and stealing! And in England itself, are such deeds unknown? Does no butler's nose assume an unlicensed purple, due to stealthy potations of fine crusted old port? Is there no groom on whose slumbering breast remorse should weigh in the shape of many a sack of purloined oats, many a truss of embezzled hay, while defrauded horses sniff at an empty rack, and hungrily whinny over a rifled manger? And as for that much reviled, long-enduring race, the 'slaveys' of lodging-houses, are all the extant traditions of pillaged tea-caddies and miraculously lessening joints to be esteemed as fabulous? But I scorn unworthy subterfuges, Jesuit quibbles, pitiful evasions. My thief was no tricky page, no fraudulent Abigail, no finger-licking cook: he was one of the moon's choicest minions, a bird of prey from the hour in which he chipped the shell.

The blood in his veins was all felonious, for he could boast, and often did boast, that his father was a thief; his mother, a thief; his venerable white-bearded grandsire, a perfect patriarch of pickpockets, was a thief; his brothers and sisters, his aunts and uncles, thieves all, from the lisping brat that could scarcely crawl to pilfer, up to the dim-eyed crone that flched on the verge of the grave. The very first precept engraven on my thief's plastic mind was, 'Thou shalt steal.' It was his mission, his labour, the object of his education. His early lessons were directed to this one end; so were his sports, in which he was taught to abstract and conceal the toys and ornaments of his childish comrades, a game at hide-and-seek, which the elders superintended with fond pride. In short, this creditable retainer of mine was just what Falstaff wished for, 'a young thief' who could 'steal well.' And this personage did I, being an officer in the — Native Infantry, openly and avowedly foster, feed, lodge, cherish, and maintain, not mewing up the thief,

who, like a poet, might be said to be born, and not made, in wild-beast fashion in a cage, but giving him the run of the house, and a fair share of confidence.

This was how it came about.

We were in the extreme south of India, and were ordered to take up our station in a little town at the edge of an alluvial plain. We heard the order, however, with some dismay, for this town bordered on the territory of a certain little tributary rajah whose reputation was more than dubious. It is a delicate operation to discuss the petty failings of royalty, but the painful truth must be told: the prince was a thief, and a receiver to boot, while every one of his amiable subjects followed the same ancient calling.

You may inquire whereabouts his royal highness's dominions lie, but I am not at all sure that my worshipful masters of the Honourable Company would approve of my being very exact in that particular. The rajah is rather a pet with the Council at Madras, and in good odour in Leadenhall Street and Cannon Row, for he is punctual with his tribute, though somehow he always takes back with the left hand what he pays with the right. So I must content myself with observing, that this potentate reigns near the river Cauvery, and not very far from the Ghauts.

On arriving upon the frontiers of his light-fingered highness, we were strongly advised by the garrison whom we came to relieve to pay black-mail to the rajah, and to hire a certain number of his people for our protection. On this subject there was a difference of opinion, and most of the ladies protested vehemently against admitting such allies within their doors.

'It's the only plan, I assure you,' said Jack Tompion of the artillery: 'these fellows respect no houses but such as contain one of their own tribe. Mere vigilance is useless. They'd steal the eye-teeth out of your head without your missing them.'

Then followed a long catalogue of predatory doings, evincing, certainly, wondrous dexterity and craft on the part of our unpleasant neighbours. Still, the ladies declared they could never sleep comfortably with a thief, 'a wretch of a thief,' in the house, until the old colonel lost patience, and silenced his wife by alluding to an oft-lamented crimson satin, which an ayah was more than suspected of having cut up into turbans and loongees for her two swarthy sons. Then every lady present took up the cry, and amid endless tales of domestic trickery and pilfering, declared that never, never, never were such dishonest servants as theirs.

'Then,' said Jack Tompion, 'can one more thief in each bungalow be so very formidable?' And so the matter was settled.

'But, Jack,' said I, 'if one hires a thief, can one rely on his vigilance?'

'Set a thief to catch a thief!' answered the artilleryman pithily.

'And will he be trustworthy?' asked Mrs Colonel Pypeley.

'Honour among thieves!' responded Jack, who, in proverbs, was a match for Sancho Panza himself.

So we hired thieves—that is to say, the majority of us, for some obstinately held out, headed by the police magistrate, who thought it *à la dîe* to bargain with plunderers, and chose to trust to his own grim-faced peons. Well, we took possession of our bungalows, bought mutton and poultry, beat the jungles for peafowl, and sent a foraging party of reckless subalterns to kill snipe in the swamps, and explore for wild hogs. On the whole, we made ourselves pretty comfortable, barring a trifle too much heat and a few fevers. But we, who had feed and housed thieves, soon had cause of self-congratulation. All the obstinate ones suffered. Mrs Girder's fat poultry

were conjured out of a walled yard in open day; the adjutant's pistols were taken from under his very pillow; a six-foot hedge of prickly pear did not save the chaplain's plump sheep; and while the paymaster lost a bag of rapeseeds from a Bramah-locked chest, his wife's pet Arab horse, a pretty white creature, with just the pinkish nose and long tail that ladies love, was conveyed out of a stable in which slept two armed syces, with a grass-cutter lying across the threshold, and a watchman with a lantern hard by. Endless were the laments, terrific the apprehensions. Guards were posted, sentinels doubled, traps set, but all to no purpose; something vanished daily. Young Hall's new uniforms, fresh from Buckmaster's—Lieutenant Straddle's big Australian mare, the Flyer, that had won the Bellary handicap, and run second at the Ascot meeting, were missing on the same morning.

Then the police magistrate's turn came. He had set our neighbours at defiance, and his whiskered peons had sworn great oaths that their swords should make mince-meat of the first robber who should approach the verandahs where they kept ward; but alas! one night the magistrate's house was thoroughly looted. Every coin, every weapon, the contents of all the wardrobes, every ounce of plate, down to the egg-spoons, disappeared; and when the peons, who had smoked themselves stupid with hemp and opium, were aroused to active life by the kicks of their irate master, thieves and spoil were miles away, never to be traced to their lair, for nothing that crossed the rajah's borders could ever be recovered.

Still, such as had hired marauders had no reason to lament it. Mine was a civil, intelligent lad of twenty, with a handsome face and bright eyes. He slept all day, and by night sat in the verandah, a red paper lantern beside him, beating a small drum at intervals, and calling out in his own language, though he spoke Hindustani fairly. His presence kept all his kith and kin aloof, and I never lost the value of a single pice. When I passed, the lad would rise and gravely salam, and I often conversed with him, and was much pleased with his ready wit and sense. I paid him good wages—about double those of a common chowkedar. One night I was awakened by a crash and clatter without, and the noise of a violent struggle. Pistol in hand, I darted out. A prostrate form lay on the ground, with a sack beside it, and another figure was crouching beneath the brandished sword of a man whose left foot was pressing on the breast of the first, while his left hand compressed the throat of the other. A number of bundles lay around, containing various portable articles of value, among which were my epaulets and my wife's bracelets and rings. A robbery had been evidently attempted, and frustrated by the gallantry and vigilance of—my thief.

Yes, to my unutterable amazement, I found the sprawling wretch on the ground was my trusty mussaulchee; the other fellow, whose teeth chattered with terror, my respectable butler, or khansamah; and the triumphant swordsman, who hailed my appearance with a cry of delight, was no other than my invaluable thief, who had surprised the rascals in the act of absconding with their booty.

'Upon my word, Ghoolab Ramdeen,' said I—'upon my word, my worthy thief, you are the honestest fellow I ever knew in my life!' Will the reader say nay?

Now, improbable as the above narration sounds, I beg to assure those who doubt its accuracy that what I have related is strictly and literally true, and I have no hesitation in saying that few officers, who have been quartered in the extreme south of the Madras presidency, can fail to have become acquainted, at least by report, with the robber rajah, his tribe,

and the singular custom of thief-hiring; while many will no doubt smile as they recognise an anecdote which they first heard among the torrid plains or tangled forests of Southern India.

MINERAL WATERS.

It is a common complaint that the titles of books have little or no affinity with their contents. The purchase of Miss Edgeworth's *Essay on Irish Bulls* for an agricultural society may have been no fault of the author; but, generally speaking, title-pages are without apology, mystifying us, as they do to the best of their ability, as to the nature of what follows:

Perhaps it may turn out a sang, perhaps turn out a sermon.

This is not the case with the volume before us—a *Three Weeks' Scamper*.* Scamper is the word, and the only word in the language that would suit it. The author neither walks, nor trots, nor gallops: he scampers through Germany and Belgium, and from spa to spa, on the most cordial terms with himself and everybody else; complimenting and being complimented at every bound; drinking freely of every sort of nasty water he can get at; eating ravenously of the table-d'hôte dinners; quaffing his half-bottle of wine at each—a much more elevating quantum, he knows well, than the whole bottle; and all with alarming good-humour, and such breathless haste—

Tramp, tramp along the land he speeds,
Splash, splash across the sea;
Hurra, the doctor can ride apace—
Dost fear to ride with me?

We don't: but the book, nevertheless, is so preternaturally springy and buoyant, that we feel as if we wanted something weighty to keep it down upon the table, and let us read it comfortably.

The doctor feels this too; for he flings in here and there, as he passes, some bits about mineral waters, and ties on to the end, like the steady tail of a kite, an appendix on their nature and uses. It is from these parts of the volume we mean to draw a few points of information, which, placed in a collective form, will serve to give an idea of a subject on which even the habitual frequenters of mineral springs are, generally speaking, in profound ignorance.

Mineral waters are either cold or thermal (warm); and the latter must always be sought for in a mountainous country, in the neighbourhood of volcanic operations, however long suspended, where the fires of the earth's centre approach nearest the surface. The surrounding scenery, therefore, is usually beautiful and picturesque; the thermal spring is *sedative*, the feeling of warmth and comfort it bestows upon the skin penetrating to the inner man; and, influenced by this natural medicine, the pains of chronic rheumatism, the twitchings of disordered nerves, and the morbid fancies of the brain, are laid asleep. Thermal baths may likewise be stimulant, according to the temperature employed and the mode of administration. When the waters are taken internally, the warmth increases the action of the salts they may contain, and enables the patient to drink more freely.

Cold mineral waters, as well as thermal, owe their medicinal properties to the substances they contain in solution, derived from the soil or rocks through which they have passed in rising to the surface of the

earth. These substances are chiefly soda, magnesia, lime, iron, and sulphur; and the acids combined with them are the muriatic, sulphuric, and carbonic. 'Thus the muriatic acid uniting with soda, magnesia, and lime, will give origin to the compound salts, muriate of soda, muriate of magnesia, and muriate of lime, and distinguish the group of mineral waters known as the *muriated saline waters*. In like manner, the sulphuric acid will give rise to sulphates of soda, magnesia, and lime, and constitute a group of *sulphated saline waters*; and the carbonic acid with similar bases will form carbonates of soda, magnesia, and lime, and compose a third group of *carbonated saline*, or, more correctly, *carbonated alkaline waters*. Iron is the basis of the chalybeate waters, and, to be held in solution, requires in the first instance to be united with oxygen, forming an oxide of iron; and it is rendered additionally soluble and efficacious by a combination of the oxide of iron with carbonic acid gas, constituting a *carbonated or acidulated chalybeate water*. Sulphur, forming the peculiar characteristic of the *sulphurous waters*, is present in the shape of sulphuretted hydrogen, and may be combined either with the muriated saline water, constituting a *sulphuretted saline water*; or with the carbonated saline water, so as to produce a *sulphuretted alkaline water*. In addition to the above, the presence of bromine and iodine in the waters gives rise to a *bromated and iodated saline water*; while certain waters are met with which are so deficient in salts of any kind as to deserve the distinguishing title of *negative waters*.'

1. *Muriated saline waters* are alterative, aperient in a slight degree, and tonic; but in choosing the special waters, it will be necessary to ascertain the relative proportions of their qualities. The chief types of this class are the Kochbrunnen of Wiesbaden, the Elizabethbrunnen of Homburg, and the Ragosi of Kissingen. The first of these waters is thermal, the second cold, the third 52 degrees of temperature. The popular Selters water is of this description. Its sparkling and piquant qualities are caused by the large quantity it possesses of carbonic acid gas, which is 80 cubic inches to the pint. It is found useful in dyspepsia, gout, rheumatism, acid secretions from the kidneys, and in scrofulous and glandular affections. It has also some popularity in chronic catarrh and bronchitis, and it is used with warm milk or asses' milk in consumption.

2. The *sulphated saline waters* are found for the most part grouped in the mountainous parts of Bohemia; and we may take as their types the Sprudel of Carlsbad, the Kretzbrunnen of Marienbad, and the Franzensbrunnen of Franzensbad. These waters are primarily aperient, and secondarily alterative, differing in these respects from the muriated saline waters, which are primarily alterative, and secondarily aperient. They have likewise the alkaline element wanting in the others. They are applicable to all the diseases of the blood and the digestive system for which the muriated saline waters are useful, and are less likely to create congestion of the brain.

3. The *carbonated alkaline waters* are represented by the springs of Ems, Fachingen, and Gellnau. Their peculiar properties are derived from the presence of carbonate of soda, and an excess of carbonic acid gas; being thus antacid and *solvent*, or in other words, with the power to soften and dissolve morbid tissues. They are used remedially in chronic affections of the mucous membrane of the air-passages, in threatening consumption, gout and rheumatism, neuralgia, gallstones, tumours and chronic thickening of organs, and in female complaints.

The *chalybeate waters*, which are represented by Spa and Langen Schwalbach, owe their character to the tonic element, iron, and are likewise alkaline, aperient, and alterative. 'The diseases in which the

* *A Three Weeks' Scamper through the Spas of Germany and Belgium, with an Appendix on the Nature and Uses of Mineral Waters*. By Erasmus Wilson, F.R.S. London: J. Churchill.

chalybeate waters are of essential service, are those of debility from deficiency of blood in the body, either from previous loss, or from imperfect formation. They are sometimes employed as the after-cure in maladies of various kinds attended with debility; and are particularly serviceable in anæmia [deficiency of blood] from whatever cause, and debility of the mucous membranes of the body, whether of the respiratory, digestive, or organic system. Chalybeate waters are also indicated in cases of scrofula, accompanied with inertness of the general powers.'

The *sulphuretted waters*, such as those of Aix-la-Chapelle and Weillbach, are essentially alterative, acting especially on the liver, the kidneys, and the skin—indeed, on all the mucous membranes of the body. These waters are divided into several kinds, being modified by the muriated saline, sulphated saline, and alkaline elements they possess. The diseases these waters, taking them generally, are used for, are gout, rheumatism, neuralgia, chronic bronchitis, certain cutaneous eruptions, chronic dyspepsia, chronic disease of the liver and lower stomach.

The *bromated and iodated waters* are characterised by the presence of the salts bromine and iodine, in combination with soda or magnesia. They are alterative and tonic, with little or nothing of the aperient element. They are serviceable in scrofula, and all diseases springing from a scrofulous origin.

The *negative waters*, which are always thermal, owe their medical qualities chiefly to their warmth. 'They may be either *stimulant* or *sedative*, according to their temperature and their mode of application; stimulant to the skin, so as to increase its functions; stimulant to the nerves, when used in the form of douche and combined with friction; and sedative when employed at a moderate temperature and in a passive state of the muscular system and brain.'

It will be seen from the above slight sketch that mineral waters form a very complicated study. No person should use them without skilful advice; for, in fact, even if they should contain in their composition the very quality the invalid wants, this may be modified by other qualities, or altogether neutralised by some component part, which our doctor terms the *drag*. There can be no doubt, however, that if one must swallow medicine, this is a very nice way of doing so. The travelling before you get at the brunnens, the scenery when there, the new faces, the new manners—all are powerful aids of Hygeia that give double effect to the actual remedy. They are, in fact, like the springy buoyant parts of this amusing volume, which lead you to the important matters, and make you accept them as a component part of the amusement.

For our part, we have on this occasion reversed the common process: instead of skimming the surface, we have exhibited the minerals at the bottom. And the doctor has nothing to complain of: for he will get plenty to scamper with him, and tramp and splash, who would otherwise be but little sensible of the riches they pass over.

A ROYAL CUP OF TEA.

The following curious anecdote is taken from a very elaborate article in the *Spectator* of January 30, on the origin, intermarriages, and connections of the royal families of Europe. Gustavus Adolphus had been deposed from the Swedish throne, and his uncle crowned as Charles XIII., with the reversion to Bernadotte, one of Napoleon's generals, who had worked his way up from a corporalship of marines. 'As soon as the deposed king had left the country, the new heir-apparent came to Stockholm, where he was well received by the whole royal family, with the exception of the wife of the ex-monarch, who had not followed her husband into exile, but, for

some reason or other, preferred to stop in her old residence. She was continually shut up in her palace, and seldom mixed with the gay world, except when she could not help doing so without offending her kind uncle, the new king, who always treated her with the greatest consideration. At last, wishing to draw her out of her seclusion, he succeeded in persuading her to receive the crown-prince, John Bernadotte, who all the while had stood aloof respectfully, not intruding himself on the ex-queen, nor on anybody else. Having consented to receive him, the wife of Gustavus Adolphus arranged the meeting at her own palace; stipulating that the entertainment on the occasion should only consist of tea and cards, as music had never been allowed under her roof since her misfortune. To this rather meagre fête the whole court and all the distinguished foreigners residing in Stockholm were invited. Sudden indisposition prevented the old king from joining the party, but the ex-queen did the honours with great seeming affability. She played a rubber of whist with Prince Bernadotte and the ambassadors of England and Russia. After cards, the tea was served, with a magnificent plateau, prepared for the queen and prince. The queen advanced, and poured out the tea into two cups, indicating one to Bernadotte, who was just in the act of taking it, when suddenly he felt the pressure of a thumb on his shoulder, forcible and significant enough to convince him that it was meant for a warning. Calm and collected, as Bernadotte was throughout his life, he did not move his eyes, but quietly and in the most unconcerned manner exclaimed: "Ah, madame, it is impossible that I can permit your majesty to serve me!"—which saying, he seized the plateau, and turned it round adroitly in such a manner that the cup which was intended for him was placed before the queen, and the other before himself. On this, the ex-queen turned deadly pale, and made a movement as if fainting. However, the hesitation was but momentary. Collecting herself suddenly, she bowed to the crown-prince and the company, and, taking the cup, drank its contents to the last drop. Great was the astonishment of the citizens of Stockholm, when they read next day, in the official gazette of Stockholm, the following short paragraph—"The Queen Dorothea died suddenly during the night. The cause of the death is believed to be apoplexy." The writer of this anecdote refers to the *Diary of Thomas Raikes, Esq.*, iii. 199.

A L O N E.

PATIENT and faithful, and tender and true,
Praying, and thinking, and working for you—
Bearing all-silently sorrow for years—
Hopefully striving to conquer my fears:
Say, did my patience, my tenderness, truth,
Merit not more than the blight of my youth?

Give me once more my wild energy back,
Give me the hopes that illumined life's track;
Give me the faith that I wasted on you—
Give me the love that I squandered thereto—
You cannot: too lightly you cast them aside,
And for you and all others those feelings have died.

Yet, though the hopes that I cherished are dead,
Though the light from my spirit for ever hath fled,
Though 'twas doubting in God when I doubted in
you—
As my standard and type of the leal and the true;
O'er the wreck of my life I would never repine,
If the peace I have lost were but added to thine.

POPULAR PARADOXES.

MR WALDO EMERSON is a person of great talent, but he has done society much evil: he has increased the admiration of paradoxes amongst us to an alarming extent. The love of common-place folk for paradox has been long one of the small unpleasantries of social life, and it has now got to be absolutely rampant. To one who is at all enamoured of fact and truth, conversation seems at present to have become little more than a series of contradictions. Polite society appears to have got one degree beyond the three stages of M. Comte's philosophy, and to the religious, the metaphysical, and the positive, has added the paradoxical—the tenets of which are, that everything is in reality the reverse of what common sense and reason would suppose it to be.

The cause of it all, of course, is, that the true is now felt to be trite, and we are too smart and too fond of excitement to bear triteness, or any approach to it. The process followed is almost mechanical, consisting simply of a catching up of exceptional cases, and converting these into rules. For instance, let a boy at a great public school chance to distinguish himself not only in the examination-hall but in the playground, be not less excellent at hockey than at hexameters, surpass all at fives, and carry away the foundation scholarship—his astonished companions circulate young Crichton's fame; and innumerable paterfamiliares, with sons all for hockey and fives, protest straightway that animal vigour and talent—*mens sana in corpore sano*, if nothing more rare and applicable strikes them—are generally found united. Byron was a great swimmer and also a man of genius. Popular paradox has thus got its rule complete—made out of a couple of exceptions—and is prepared to contend that most heads of eights, most captains of boats at public schools, are in the habit of carrying off prizes from the studious and unathletic of their own standing; nay, that young men at the universities competing for high wranglerships and first classes in the tripos, are so far from being necessitated by the severity of their course to give themselves up almost entirely to study, that the senior is generally selected from the racing-boats, and the head of the classical year from among the members of the drag.

We have ourselves had much school, and the ordinary amount of university experience, and in both cases have doubtless seen one or two exceptions, such as popular paradox delights to point out; but certainly, as a rule, the youths who gave most attention to the amusements of the playing-fields, shewed, as was naturally to be expected, less diligence

at their books; while the *sappers*, or readers out of school-hours, for the most part rose—nor were we surprised at it—to the head of their forms. We don't mean to state that the great football players or first-rate bowlers were fools—no person who excels in any pursuit whatever can well be termed so—but they were, upon the whole, although very good fellows, the dullest amongst us. The school of so-called muscular Christianity has been supposed to give some colour to popular paradox in this respect, but we think without reason. It only protests against an undue prominence being given at our schools to the mere development of intellect, and insists upon the great advantage and moral benefit of athletic sports. Mr Kingsley's Tregarva did not write poetry because he was a gamekeeper and always out in the open air; nor is it asserted that gamekeeping is the profession most suitable for a bard to follow during his uninspired hours.

It used to be acknowledged that men of genius did not make good men of business, or men of the world; but latterly, a few instances of the reverse having appeared, the paradoxical are now heard asserting that such men are quite as acute and knowing as their neighbours. Now the fact is, that, to be a man of genius implies a nervous organisation of great delicacy, impressionableness, and excitability—a frame of mind little suited for bearing well the rubs and contentings of common worldly life; while to pursue the path of a man of genius, in poetry or in art, demands an abstraction and concentration of thought which usually unfits one for paying attention to common worldly things. Hence it is not to be expected, as a rule, that such men are to shine in the world of affairs, or even in ordinary social life. But sometimes there is an instance of a poet or a high-class painter being successful also as a man of the world or of society; and the paradoxical accordingly *discovers* that it is a mistake to speak of men of genius as heretofore—see such and such instances. Or perhaps he points to instances of men who are merely men of ability, as verifying his rule; when the truth is that all the successful men of the world are men of ability—a different thing, however, from being men of genius.

Another very popular paradox is this, that the cleverest persons are the most modest. As we do not happen to have known, nor even to have read of, any person at all remarkable for cleverness who was not aware of the fact, and perfectly conscious of his superiority, in that respect, over his fellow-creatures, we are at a loss to conceive how this opinion first arose: it must, we think, have been

coined in malice to cast at some conceited wit; just as one might viciously invent, for the setting down of a vain young woman, that really pretty people were always the least cognizant of their prettiness. We do not, of course, contend that there is not a charming modesty, the companion of true talent, which shrinks from a comparison with even an inferior rival; but that is not at all what popular paradox in this case means. It means, we believe, simply to convey something disagreeable to a clever antagonist, or to one who thinks himself so—who, in the matter of confidence, has often, it is true, the advantage of him of genuine powers. In the same spirit, it is alleged that your new great man is always exclusive and proud, while your old aristocrat is the reverse. We have had opportunities of observing people of all ranks and conditions, and of every kind of history; and our conclusion is, that there is, with scarcely ever an exception, a hesitation and want of assumption in those who have risen from mean estate, and even in the children of such, as if feeling how unbecoming anything else would be in them; while the utmost affability of the old aristocracy—and affability is with them the rule—always leaves a certain halo of dignity reserved, which is never to be broken through. On this latter point, let us only consider—is it to be expected that a class of persons studiously toadied, or, to say the least, most deferentially treated, from their bassinets with Valenciennes trimmings, to their coroneted fourfold coffins, by nine-tenths of those who surround them, should *not* be proud?—that persons exempt from the ordinary cares by which they perceive the rest of the world to be annoyed, should not consider themselves as superior beings?—and that those who, by the accident of birth, find themselves entitled to rule their fellows, should *not* fully estimate that accident? The contrary cannot reasonably be looked for; nor is it, save in exceptional cases, found. Popular paradox is in this matter guilty of a flattery so gross, that snobism herself—for she is certainly less male than female—has forged an excuse for it: she calls the pride of birth a proper pride.

Now and then, and to our extreme disgust, we find some virulent democrat abasing himself to the dust at the feet of a lord; and from our astonishment at chance specimens of this kind, arises the not uncommon saying, that there is no toady like your radical. Such a sweeping paradox must, in the very nature of things, be false. What a vain disguise must the mantle of independence be to that poor wretch who stripes himself, and spreads it for a carpet for the first great man who comes his way to tread upon! What possible end can it serve? Its would-be proprietor can scarcely get a single day's wear out of it; not to mention that his less pretentious fellows are always ready to tear off the flimsy garment, and expose him in his cringing nakedness. So difficult, indeed, is the assumption of this independence by a character to which it is not natural, that the vulgar have a popular paradox to excuse their laying claim to it at all—the superior mind minds its superiors; which, although somewhat plausible-looking, is, as it stands, next to meaningless, and, in the sense which they would have it to signify—persons most conscious of their individuality, are the most ready to defer to the authority of rank—is simply untrue.

Now and then, a man of distinguished talent is found to have had a clever mother, while the father was an ordinary person; and paradox, delighted with the unlikelihood of the weaker vessel thus manifesting the superiority, rushes to the apothegm, that talent *always* comes through the maternal parent. Perhaps the illusion is assisted by an amiableness in men of ability themselves, which disposes them to attribute as much as they possibly can to that parent

from whom all are conscious of having received the most affection. While autobiographies are generally favourable to this paradox, biographies shew its fallaciousness; there we find whole strings of men—father, son, grandson—all eminent in some particular walk, and not a word of the mother. The truth is, ability sometimes comes from the one parent, and sometimes from the other. It is perhaps an equal chance—no more.

Proverbs, from the necessity of their being sententious and epigrammatic, are very often paradoxical, and not seldom contradictions in terms. The fact, for instance, that, here and there, circumstances have occurred in real life so extraordinary, that no one could have imagined them, and far less ventured to embody them in a work of fancy, assumed, proverbially, the form of 'truth is stranger than fiction'; although, when anything particularly astounding appears in the public prints, it is straightway ascribed to America, and turns out, as was to be expected, not to have had foundation in fact.

What terrible mistakes in the judgment of character have arisen from a proverb such as this: 'A little straw shews where the wind blows'; that is to say, an individual and unimportant act may be taken as an index of a disposition; as though, of all the thousand springs which influence a human soul, we could lay our finger upon the particular cause that has actuated it in some transitory matter, and, far less, as if from that action we might assume the mainspring of a nature. How often has a mere kindly impulse been thus mistaken for a noble principle, or a thoughtless deed ascribed to the dark influence of self!

Let us forget these sad reflections in the recital of an amusing circumstance very illustrative of the fallacy of a similar proverb. We had occasion once in our hot youth to start from Oban on the west coast of Scotland to join a reading-party at Inverary, and, as is sometimes the case in that locality, it was raining; the third silk umbrella which we had purchased within that year had been 'mislaid' on the sea-passage, and we were resolved to buy no more: a very ugly ootton one, however, bulgy as Mrs Gamp's, and without even the decoration of a handle, tempted us by its very reasonable cost of one-and-ninepence, to become its proprietor; and with that we started on the coach-box, where it did its duty through the whole journey as bravely as though it had been valued at thirty shillings. At Inverary it was the most useful machine possible; its ferrule happening to fit into the rudder-hole of a somewhat rudely appointed boat, in which we navigated the loch, and so steering us; and its ample folds forming an admirable drag-net for shrimps, much better than either pocket-handkerchiefs or towels, in the pools left upon the rocks when it was low-water. Finally, it answered its original purpose in keeping off the rain so far as Tarbet upon our homeward journey; but at that fashionable hotel we were of course not desirous that attention should be directed to it. It was old, indeed, in years already (for we had bought it at second-hand), and besides that, the uses to which it had been put had prematurely aged it. It was much worn, in some places even to baldness; more than one of its ribs were broken; and the action of sea-water had very much affected its original colour. Now that we had thrown off our long-vacation toggery, and were on our way to the metropolis, we would not indeed have been seen in its company upon any account; therefore, on the morning of our departure, we laid it carefully beneath the bedroom window-seat, as in a tomb, intending to bid it a good-bye for ever, and forget it like any other old friend in evil circumstances, who was become no longer necessary to us.

But while the company were waiting upon Loch Lomond pier for the arrival of the steam-boat, and we

ourselves in fashionable costume were becoming impressive to certain young ladies of rank and fortune, a cry arose from the direction of the inn, and down rushed one of the waiters towards us, waving the horrid thing in his hand, and shouting that some gent had left his umbrella behind him.

We knew indeed that it was a shabby one; but never before that moment, when it was held aloft amid the general laughter and contempt, had we had any conception how very disreputable and even debauched its appearance was.

'Whose can it be?' cried one of our fair friends in convulsions of merriment.

'We can't imagine,' cried we: 'there must be some mistake. I dare say it belongs to poor Boots.'

'Surely,' cried one of our long-vacation party maliciously, being consumed with envy at our popularity with the beautiful heiresses—'surely that must be your favourite old umbrella.'

'Yes, sir,' cried the waiter snappishly: 'No. 15; that was the party's room, sir; and the party's name is scratched, I see, upon the stick.'

Amidst roars of laughter, we were obliged to confess to the proprietorship of the disgraceful object.

'Remember the waiter, please, sir,' urged the officious menial. 'I ran down as quick as I could for fear of your losing it.'

'Yes,' said we, with withering sarcasm; 'in remembrance of your kind attention, you may keep the umbrella all to yourself.'

The mischief, however, had been done; and for any attention, not to say kindness, that was thenceforth paid to us, we might just as well have been among the steerage-passengers. A new *silk* umbrella, we had never been able to keep above two months; but the old *gingham*, you see, stuck to us whether we would or not. Now, we put it to the reader, does not this pretty effectively dispose of the popular paradox: 'Take care of the pence, and the pounds will take care of themselves.' That is to say: 'Be careful in little matters, and you will surely be prudent enough in great affairs.' As though the celebrated miser, Elwes, had not been accustomed to walk away from the gambling-house where he had lost his thousands, to meet, in polished leathers, his muddy sheep, and see that they were cared for upon their road to Smithfield. As though there were not countless speculators upon 'Change this day, who have risked their all twice over, and yet would think it wild extravagance to return home by cab instead of omnibus. Nay, as though there were no antidote to be found among proverbs themselves, for such a poisonous paradox, in the simple saw of 'Penny wise and pound foolish.'

CATALOGUE OF THE IRISH ACADEMY MUSEUM.

Amongst the books of general interest in which our day abounds, we may fairly begin to give catalogues a place. They are no longer uninviting columns of hard names, additional perplexities to the unlearned: they are becoming interesting and suggestive companions; friendly guides, combining simplicity of plan with minuteness of detail; teaching us how to observe, as well as telling us what to observe. It is happy for us that there are such works, for few of our searches after pleasure prove more utter failures than visits to museums, galleries, collections of any kind, without the clue a systematic and explanatory catalogue affords. This holds good especially of antiquarian museums, where there is comparatively little to attract the eye, and things by no means tell their own tale. The Museum of the Royal Irish Academy has had rare service done to it by Mr Wilde in his

catalogue now before us. A laborious undertaking it must have been; but it was, we are told, a labour of love, with success for its only, yet adequate reward. Equally profound and clear, it is calculated to give elementary knowledge to the previously uninformed, and to extend the specific information of the archaeologist. But it is in its former capacity we have to deal with it on the present occasion; and therefore it is to the many who, whatever their floating notions on the subject of Irish antiquities may be, prefer, like the immortal M. Jourdain, that their instructor should proceed as if they had none at all, we now say: 'Come and place yourselves, with us, under Mr Wilde's guidance; and let us follow him through the grim and dingy treasures of three sections of the Dublin Antiquarian Museum.' Grim and dingy indeed, yet appealing to our sympathies, by the claim irresistible, when pondered, of their human interest. These rude unshapely stones around are not bones or footprints of some mighty monster of the pre-Adamite earth; these vegetable remains are no fossilised branches of its giant flora, waking our vague wonder, and drawing largely upon our imagination. These relics come more nearly home; they have all been hewn out in the sweat of the brow of our brother-man; more, they have been the weapons of his warfare against human foes—some, of his better warfare against the stubborn soil; others were the decorations dear and significant to him as ours to us—others, the implements that ministered to his sense of comfort in his temporary home; these, the altars sanctified by the form of his ignorant worship—those, the monuments made sacred by his tears for his beloved dead. The whole represent, or form an unwritten history of our species in the earliest stage of their being, while as yet the use of metals had not been learned.

Availing ourselves of the system of classification adopted by our guide, and relieved to find that, in the absence of positive chronological information, it is a simple one referring to material and use, we know beforehand what we are going to look at—no inconsiderable point gained. In the first place, at class one—Stone materials subdivided into three orders—flint, stone, and crystal; next, at class two—Earthen materials, comprising clay and pottery, glass and enamel; then at class three, which includes wood, amber, and jet. Such is the primary division, so far as it concerns us on the present occasion, for animal and metallic materials, as well as for excepted classes, form no part of the first volume of this remarkable catalogue. The secondary division is according to use, and contains twelve species: 1. The earliest necessity of savage communities—weapons offensive and defensive against man and beast. 2. Weapon tools. 3. Food-implements, almost all of them as familiar in name as they are diverse in materials and structure from their modern representatives—old-world means for present ends. 4. Household economy, comprising articles of domestic use, aid to the toilet, models of habitations. 5. Dress and personal decoration. 6. Amusement. 7. Music. 8. Money. 9. Medicine—that is, magical medicine, with crystals and amulets for its pharmacopoeia. 10. Religion. 11. Sepulture, including relics illustrative both of the heathen and Christian mode of hiding their dead out of their sight. And 12. Miscellaneous—objects arranged according to material, but the uses of which are problematical.

First in order, then, we glance at a tray of flint-flakes of various hues and sizes; flint, the steel of those olden times when iron was slumbering in the earth's veins, unguessed at and unneeded, for it is marvellous how much and well flint could do, when it was to be had. Flint proper, however, is by no means abundant in Ireland. We should be rather puzzled to chip those flakes so cleverly now,

especially with flint for our only tool; and how those we call barbarians conquered the difficulty, must remain as yet matter of conjecture. We are rather comforted by supposing that they failed sometimes, for we find a large collection of rude and shapeless objects, evidently the production of 'prentice hands,' and thrown aside as useless.

Next, we have flint sling-stones, carefully shaped and polished, looking at which, all, even the youngest of our party, is reminded of the smooth stones out of the brook which the ruddy shepherd-boy chose for his weapons, although the heavy sword and armour-of-proof of Israel's king were ready for his use. Very fatal these sling-stones were in the hands of skill, even when these were feminine hands; a fair Kathleen, in dim distant times, having thus killed Balor, a one-eyed chieftain. A less fortunate Amazon, Meane, Queen of Connaught, fell victim to a stone, slung across the Shannon by a cowardly Ulster prince, who took dishonourable advantage of an unsuspecting hour when she was bathing in that beautiful river. Equally fatal was a sling-stone to the poetess Dubh—a warlike muse, no doubt—who fell down into the Linn, a dark pool of the Liffey; whence comes the name of her country's capital, Dubhlinn, or, as we write it, Dublin.

From sling-stones, we pass to arrow-heads of every variety; from the simple triangle to the more convenient stemmed arrow, the true barbed arrow and the delicate leaf-shaped—the connecting-link between the arrow and the most perfect manufacture of the weapon class, that of the spear. But before we leave the arrows, we must allude to the ancient superstitions that among the northern peasantry attributed to them certain malignant influences. This fact gives us some idea of their remote antiquity, since we find that at a very early date these stone-weapons were looked on as relics of a far-distant period, and wondered at as now. The Norwegians called them thunder-stones; the Gaels, elf-darts; nay, the popular mind still pronounces them as uncanny, connects them with the falling away of that family-prop, the cow; and the cattle-doctor, by some legerdemain, is sure to verify the theory by producing a fairy missile or two—found, he avers, in its skin—which being, upon some homeopathic principle, placed in the water the animal drinks, is known to effect a cure. Curious this popular poetising of what was once matter-of-fact everyday implements, appealing no more to the fancy of those who aimed them, than the Minié-balls our soldiers ram down into their rifles do to theirs. Time has ever some gradual growth of legend to green over the driest fact.

The line of demarcation between large arrow and small spear-heads is, we are told, difficult to draw; and we are led to suppose that such specimens may have been turned to either use as the case required. But we proceed to flint-tools, invariably made of the best and hardest flints, which are generally of a yellow or orange hue. Here we have the picks, punches, points, piercers, and chisels, or, as we generally find them called, celts, with which the early inhabitants of Ireland wrought in wood, horn, leather, and stone alike; for all these flints—unmentioned in the earliest existing records—belong to the pre-metallic period.

We pass next to the weapons of softer stone, and tools which were hard enough to work with in wood. Under this head we have swords, knives, cleavers, and, above all, we have celts—so called from the Latin word *celtis*, a chisel—the most widely distributed of stone-implements. Ireland and Scotland alike abound with them, and they are to be found of every species of native rock, from the brittle sandstone and the soft micaceous schist, to the sharp-edged silex and compact porphyry. As in

materials, so they differ in workmanship, some of them being blunt and clumsy, others elegant in form and elaborate in polish—marvellous to behold indeed, when we reflect that all this symmetry and precision was the result of no better tool than another stone afforded. An immense amount of skill and toil must have gone to the turning out of a 'first-rate article,' in those days of honest and unpuffed manufacture. These celts were formidable weapons, no doubt, in the hands of their namesakes. It is generally believed that they were first used as a mere hand-tool, and subsequently fixed in a cleft stick. It is thus that some South-sea Islanders use them at the present time. Some late researches tend to shew that the French celt, as might be expected, was more elegantly fitted into the hollow portions of a stag's horn.* But perforated celts are very rare in Ireland. Whether celts were exclusively weapons or exclusively tools, is a nice little open question for the scientific to differ upon. The chances are that a celt was turned to many purposes, and hacked down a tree as well as a foe. It has come to peaceful uses in its later days. The weavers in the north of Ireland rejoice to find a smooth celt to rub on their cloth, thus giving it the desired gloss. There is one in the Museum of 'green felstone, stained bluish,' and marked with mysterious lines and scratches much like Ogham characters. Before, however, any imaginative archaeologist had translated them into a meaning, the Rev. Dr Graves discovered their recent origin. The blue turned out to be caught from the indigo dye of a linsey-woolsey petticoat, the tracery thereon being perhaps the work of the weaver's child, who no more dreamed of perplexing the erudite than did Aiken Drum of misleading the worthy Monkbarns into his splendid day-dream of Agricola's Prætorium.

From the five hundred and twelve specimens the Irish Academy Museum possesses, we pass on to what implies a decided advance in art—the stone-hammers, of which we have here several varieties, one resembling a good deal in its form the hammer of our own day. In Scotland, so we are told by Dr D. Wilson, these hammers were often found in old cists; and superstition explained the fact by supposing that the owner had wanted them to knock with at the gate of purgatory.

We glance next at objects the use of which involves the acquaintance with metals, such as whetstones, burnishers, touchstones, and moulds for casting. We look with peculiar interest at primitive stone plough-shares and grain-rubbers for tritulating corn—the latter an implement of incalculable antiquity, since the rotatory querns we come to next have been in use since the earliest historic period; we notice one specimen of a stone drinking-bowl, very few of which have come down to our time; we give a passing glance at the stone buttons, beads, and armlets, that once gratified the innate love of decoration man in all ages exhibits; we are glad to find what we assume to be traces of his amusements in fourteen decorated, domino-like pieces of sandstone; and now our eye rests with interest on the sheen of two crystal balls, one of which, of two inches and an eighth in diameter, is reported to have belonged to the regalia of Scotland, globes of crystal having been commonly set in sceptres; the other was found in the county of Kilkenny, and has no known history attached to it. Crystal balls and ovals are frequent in British collections of antiquities, the smaller kind having evidently belonged to shrines, whence, no doubt, their supposed healing powers arose. This Kilkenny ball we look at here—was it like that celebrated globe, now in the possession of the

* See Dr D. Wilson's valuable work on Scotch archaeology.

Marquis of Waterford, brought from the Holy Land by some returning crusader—has it, too, been placed in running streams, through which sick cattle have been driven to and fro; or has it served as a magic-mirror, gazing into which the omnipotent fancy of a yearning heart has seen in weird procession pass 'the changed, the loved, the lost,' the absent and the dead? Nay, if we held it in our own hands, might we possibly contrive to see something within its globe? Modern superstition has of late years taken the occult properties of crystal balls into grave consideration; and no further back than the year of the Great Exhibition, more than one grave professional mind—to say nothing of more facile and fanciful believers—did positively hold that wonders were to be seen in them by the clear eye of childhood.

We have now arrived at species ten; and under the head of religion, we have altar-stones, and the model of a stone enclosure in the deer-park of Hazlewood, county Sligo. In such stone enclosures it is with good reason supposed that the cruel mysteries of Druidical worship were carried on, and possibly solemn assemblies or courts of justice held. Sligo is rich in remains of this kind, the largest collection of circles and cromlechs in the British Islands being, according to Dr Petrie's statement, not far distant from the one this model represents.

Under the head of sepulture we have, as might be expected, much to occupy our attention. 'The small square stone grave, or kistvaen, containing a single cinerary urn; the collection of urns that mark the site of an ancient cemetery; the large stone circle or oblong enclosure, popularly called a 'giant's grave,' the huge barrow (the western type of the true Oriental pyramid), the rude pillar-stone, the Ogham-inscribed monolith, the sculptured cross, wayside monument, stone-coffin, &c.—all affording examples of the use of stone materials in sepulchral rites.' There is a large collection of pillar-stones inscribed with Ogham characters; a kind of circling which some antiquaries believe to have been invented by the Scythian progenitors of the Danish race, and introduced into Ireland about thirteen centuries before the Christian era. A few of these curious stones have been found in Wales and Scotland, and one in Shetland; but it is in Kerry and Cork they most abound. Just noticing that these inscriptions generally present proper names in the genitive case, as do the ancient monumental inscriptions of Cornwall and Wales, we leave Ogham for sculptured stones on which Irish inscriptions may still be traced, such as, 'A prayer for Bran,' 'A prayer for Dunciad the Presbyter.' Amidst inscriptions like these, we are struck by a bass-relief, said to commemorate the destruction of Ireland's last wolf by a noble dog belonging to the O'Dowd.

We have now come to the second class—that of earthen materials, under which are included, as sole representatives of the tool species, four small crucibles; the food-implement and domestic economy departments being more fully illustrated by sundry glazed jars, known under the name of bellarmines or greybeards, bottles, smoking-pipes of primitive fashion, small-bowled and thick-shanked, but not so old as we might suppose. Then we have pavement tiles, more or less glazed and ornamented, well worthy the attention of those interested in tessellated work.

In order two, class two, species five, according to Mr Wilde's lucid system of arrangement, we come to glass and enamel articles of decoration. It is suggested that one of the very first uses of glass was that of personal adornment; and until we have learned to connect costliness with beauty, and difficulty of attainment with pride of possession, it does—with its sparkle and its rainbow colours—seem admirably adapted for it. The child would choose the bead-

string before the pearl; and the savages, whether in arctic or tropic regions—grown children as they are—like nothing so well. Blue and white appear to have been the favourite colours in porcellaneous enamel, that link between pottery and glass. We are told that it is impossible to decide when glass was first introduced into or manufactured in Ireland.

We return to order one, class two, to contemplate, under species nine, a number of Irish cinerary urns. These Dr Wilde has, he tells us, found difficult to classify, since, in the absence of metallic weapons, or other relics that define date, chronological arrangement becomes impossible—the skill they display and the varieties they exhibit being probably indexes of their relative value, or characteristic of peculiar races, rather than data to fix their epoch. There is every reason to suppose that urn-burial was not the earliest form of sepulture adopted in Ireland, but that the bodies of their chiefs were interred entire within their cromlech-chambers, in ghastly splendour, with their favourite animals to bear them company. Hundreds of these cromlechs are still to be seen with chambers capable of containing one or more human bodies in whatever attitude placed.

Urn, whatever their position, erect or inverted, are found to contain fragments of human bones which have unquestionably been subjected to fire. In addition to these, those of minor animals are found less calcined, which leads to the conjecture that these animals were thrown on the expiring embers of the funeral pile. Most of the urns in this collection are formed by the hand alone, and were probably made with whatever materials came readiest, and baked on the spot. Some of them, however, appear to have been far more carefully made. The most beautiful mortuary urn ever discovered in the British Isles is so like in form and pattern to the echinus, common on our shores, that it is probable the artist took that shell for model. It is composed of very fine clay, and possesses a handle, which is rare. This pretty little urn, which is but two inches and one-eighth high, and three and three-quarters wide, was found to contain baby-bones. It was enclosed in a much larger and ruder urn—perhaps mother and child were burnt together; and yet we think that this delicate little urn must have been chosen, if not designed, by a mother's love. Some years back, cromlechs, we are told, were held to be Druid altars; but a discovery made in the Phoenix Park twenty years ago has gone far to prove them 'uncovered tumuli, which originally contained sepulchral remains.' It may be stated here that both cromlech and urn burial in Ireland are pre-historic. Passing over Chinese seals, which have been formerly noticed in this Journal,* we now prepare to follow our guide to the third class—that of vegetable materials.

Although the timber of the forest must, as Mr Wilde remarks, have been the material of man's earliest weapons of protection or offence, as well as of his earliest habitations, yet, from its decaying nature, we cannot, in Ireland's humid climate, expect to find any very ancient relics, save those which the peat-bogs have preserved for us.

Both history and tradition, and the still more infallible peat-moss records, aver that the Emerald Isle was once well covered with wood. Far down beneath the surface of its oldest bogs, traces of oaks, yews, and pines of stupendous size are still found. Even within the period of modern history, we have accounts of extensive forests as still existing. A few indigenous woods still remain, but the fir is scarce in these.

No weapons or tools of great antiquity having come down to the present day, we pass on to species three—that of food-implements; and amongst these, our

* See No. 414, New Series for December 6, 1851, p. 364.

attention is peculiarly attracted by some ancient boats, of which there were two kinds in use in very early times: the curragh, composed of wicker-work, and covered with hide; and the single-piece canoe. Ancient curraghs of course no longer exist; but we have two specimens of the canoe in this museum, the first measuring twenty-two feet in length, and about two in breadth, flat-bottomed, round-prowed, and square-sterned. In this boat—discovered below the surface of a marsh on the Wexford coast—were two rollers, apparently for the purpose of getting it out to sea, and a small bowl for baling. The second specimen is sharp at both ends, lighter, narrower, and thinner. Its width is but twelve inches; its length, twenty-one feet three inches, and it is perfectly flat at the bottom. Passing on rather quickly, for our visit to the Museum has been a long one, we notice a rope made of 'three strands of heath,' and are informed that heath-ropes, though becoming very rare, are not absolutely unknown in Ireland in modern times. Next, we observe spades and forks, one of the latter, a colossal implement indeed—seven feet and five inches in length, with prongs of more than a yard. The Academy possesses an extensive collection of kneading-troughs, dishes, bowls, and tables, all made of one single piece of wood. The small portable table to which our attention is called, is supported by legs of only four inches and a half high; and the natural inference drawn is, that those who used it, sat round it on the ground. It is also probable that, when wanted, it served as a kneading-trough. Next come milk-pails and butter-prints, one of which looks as if it would still turn out neat, flower-patterned pats. Of mether-drinking-vessels so called because mead or metheglin was quaffed out of them—this museum boasts twenty—some very ancient indeed. The mether and its handles was always formed of a single piece of wood, but the bottom was separate, and inserted into a groove. In methers of the simplest make, this bottom piece was probably pressed into its place after the vessel had been soaked in water, and secured there by its contraction in drying.

Species four includes several wooden articles of domestic use, all of considerable antiquity, such as candlesticks, beetles, bodkins, stamps, &c.; many of them found in craunoges. It is with some of the information Mr Wilde supplies on this head that we shall conclude our present article; but first we must notice, under the head of domestic use, an ancient waxed tablet-book of pine, found in one of the bogs of Derry, on the four sheets of which the letters are traced with a sharp point, and still very legible in places. The character is Irish, but the language Latin. After all the trouble of deciphering it, it appears to have been 'little better than mere scribbling'—'Exercises in grammar and dialectics.' Possibly the scholar of the eleventh century, to whom these tablets may have belonged, did dream of immortality for some work of his, but he could never have supposed that these memoranda would, after six centuries, excite the interest of posterity!

To return to craunoges. These were stockaded or little wooden islands, many of which have come to light during the general drainage of late years; the agriculturist, without in the least intending it, having proved himself a most valuable labourer in the field of archæology. These craunoges, though alluded to as early as in records of the ninth century, and as late as in those of the seventeenth, were never examined till about twenty years ago. Craunoges are chiefly found in the clusters of small lakes in Roscommon, Leitrim, and Monaghan, and are not, strictly speaking, artificial islands, but clay islets enlarged and fortified by timber piles, and in some cases by stone-work. A few were approached by

causeways, but they were generally insulated. These beaver-like habitations afford several indications of the changes that have taken place in the face of the country between their day and ours: their submerged condition shewing us how great the spread of water has been; while from additions made to the height of the stockades, and from traces of fire at different elevations, it may be inferred that this spread had, owing to the decrease of timber and increase of bog, begun during their period of occupation.

The first craunoge ever examined was one at Lagore, near Dunshaughlin, county Meath. Looking into the authorities, we find this craunoge to be the first alluded to. Loch Gabhair is said to have been one of the nine lakes which burst forth in Ireland, 3581 A.M.* Its discovery in 1839 was accidental—as we phrase it—in looking for one thing, another was found. The lake around had been drained within the memory of man, and the craunoge bore the appearance of a circular mound of about 520 feet in circumference. Some labourers having met with several large bones while clearing the stream-way, the fact became known; bone-collectors came, and so the craunoge, with its vast collection of antiquities, was revealed. Structures very similar in character have been discovered in the lakes of Switzerland in the year 1853-4, where, the winter having been unusually dry and cold, the lake-level was depressed in proportion; and one or two have also been described as existing in Scotland.

With the vegetable materials, the first volume of Mr Wilde's invaluable catalogue ends, and rejoicing to hear that the remainder of it is in progress, we close our present survey of the Irish Academy Museum.

JOHN BULL'S DINNER AT NING-PO.

We are all familiar with the story of the Englishman who interrogated his Chinese host as to the character of a relishing dish on which he was feeding, by a significant repetition of the words, 'Quack, quack, quack?' and how the mandarin replied by simply pronouncing, with a gesture of negation as to the hypothesis, the expressive monosyllables, 'Bow, wow, wow!'—thus tracing the agreeable viand to a canine instead of an anserine origin.

Again, our ordinary idea of a Celestial breakfast, dinner, or supper, is expressed by the formula, 'boiled rice, and hunger for sauce.' Looking at it in a general way, this may not be so far wrong; but there is more than this to be told about the culinary arrangements of our tea-producers on the other side of the globe.

If we are to judge in this matter from a report in a recent number of the *Times*, the Chinese 'cooking animal,' man, has often something better to do than merely boiling rice and stewing dog's meat. According to the shewing of 'Our Special Correspondent,' Paris itself must yield the palm to Ning-po, and Very hide his diminished head before the superior merit of mine host of 'the Gallery of the Imperial Academicians' in that famous city. Acknowledging, then, our deep obligations to the ingenious writer alluded to, and tendering him our best thanks for the information conveyed in his letter, we shall proceed to give our own report on his report, with a few observations thereupon.

Our author begins with some severe strictures on our English methods of cookery, and by so doing raises the whole question as to the salubrity of baking and stewing as compared with roasting and boiling in general.

Our space will not allow us to take up formally the gauntlet thus thrown down, or to enter the arena to fight out à l'outrance this battle of the spit and gridiron against the stew-pan and baking-dish. We would only observe that, in all such cases, climate, early habit, the age and state of health of the party—we had almost said the patient—and, last not least, the quality of the provisions supplied, must enter into and greatly modify the consideration of such questions as this.

No man will say that it is wise, in a culinary point of view, to roast a sirloin cut from the back of a ten-year-old ox, well accustomed to the yoke; or that a pickled round of such beef will be juicy and tender; or that a goat's haunch, with turnips, will be as satisfactory as one which our own South Downs or Black Faces can supply. If you have a certain sort of meat to dress, you must dress it so that it shall be eatable; and the soup and bouilli, or the disintegrated stew, enriched with a strong and spicy gravy, is, in a great many instances, far preferable to what could be produced were the same meat to be sent to table à l'Anglaise.

We believe that the objection made by this ingenious writer against English cookery would apply much more to the excessive quantity which the excellence and succulency of the national food induces our countrymen to eat, than to any particular mode of preparation. He speaks of 'a slice of red flesh from a joint,' as if the eating of such a thing were an act only one degree removed from cannibalism; but we can inform him that raw flesh, when sent to table, must always look purple or blue, and that the very fact of redness shews that it is cooked enough; and we can bring at least one set of digestive organs to testify that it is much lighter and more easy of assimilation in that state, than when it has passed into that of being what is called 'well done.'

We attach, however, no especial importance to any particular mode of cookery. If one method is found to be more conducive to health and comfort than another, by all means let it be adopted; and we will go so far as to add, that if men must *cram* when they dine, we should think it a less injurious process, on the whole, for them to do so with a variety of dishes, and many of them what we should call over-cooked, than with meat from one simple joint; while, at the same time, we cannot agree that to eat a moderate share of our own 'rare' and juicy mutton or beef, is equivalent to bringing the civilised man down to something like the level of the savage or the wild beast, both of whom, it must be confessed, have a fancy for 'joint-meat,' and prefer it, if anything, a little under-done.

We shall not enter further here into this culinary controversy, but return at once to our notice of the dinner at the 'Gallery of the Imperial Academicians' at Ning-po.

'Our Correspondent,' it seems, had learned that matters gastronomic were managed in a superior manner at the above-named hostelry; and he accordingly resolved to bring the report to the test, in a sensible, practical sort of way, as a true Englishman should. So he issued invitations to a select circle of friends, English and Chinese, for a banquet to be there provided. With each invitation, a chop-stick—to be used, we presume, as a fork—was sent to each guest. In due time the day arrived; the party assembled; and now, 'to dinner with what appetite we may!'

The first course was merely a prelude—a sort of light fencing with chop-sticks, intended to excite rather than to gratify the cravings of hunger. It consisted of 'a small square tower, built of slices from the breast of the goose; a tumulus of thin square pieces of tripe; hard-boiled eggs, which had been

preserved in wine, and the excellence of which was supposed to be in proportion to their antiquity; berries and other vegetable substances, preserved in vinegar; a curious pile of some unknown shell-fish, taken from the shell, and cut in thin slices; prawns in their natural, or rather in their artificial red state; ground nuts, ginger, and candied fruits.' 'Everything,' we are informed, 'was excellent in its kind'—the unknown shell-fish especially so. 'I am afraid to say,' adds the writer, 'that the tripe was a creditable piece of cookery. It was boiled to almost a gelatinous consistence;' but 'many Englishmen' known to the author, would, he doubts not, 'have devoured the whole small heap, as it stood, with avidity.' For our part, we should quite think so.

A certain doubtfulness was observable in the approaches of the strangers at first; but this soon gave way to complete confidence before the more serious attack commenced.

The 'trifles' above enumerated being despatched, we are informed that the real business of the day was fairly begun. Each guest was furnished with a porcelain spoon and saucer; knives were altogether needless, and their chop-sticks they brought themselves. A folded towel, just saturated with hot water, was placed beside each saucer, and two tiny metal cups, not so large as egg-cups, were allotted to each person.

The first dish, according to all precedent, was of course *birds-nest soup*. To our surprise, our friend professes not to know what these nests are. We believe they consist of the dwellings of a particular species of swallow, and are composed of a gelatinous sea-weed, which is recommended by its viscous quality to these ingenious constructors, as an excellent building material. Unluckily for the peace and security of their domestic arrangements, John Chinaman has found out that it is more convenient to plunder the poor swallows than to collect and prepare the sea-weed with his own hands, just as we do by taking the honey from our bees instead of seeking it 'from flower to flower' for ourselves.

Our author does not write enthusiastically about this celebrated dish. The presence of the birds-nests, it seems, is apparent from a glutinous substance which floats upon the top of the soup. Below this is a white liquid, and lower still is chickens' flesh, altogether an insipid affair enough, we have no doubt; but as a variety of prepared sauces and spices were at hand, by following the example of the Chinese, who excel in the use of such condiments, this insipidity was in great measure removed, and the swallows' nests are got rid of with tolerable ease.

The next course is, a *stew of sea-slugs*. At Macao, these are white; at Ning-po, they are green: at both places they are excellent eating. They are difficult, we are told, to catch with the chop-stick, as they slip about with much alacrity on the china saucer. When caught, however, they are well worth the trouble; for it is said they resemble, and are quite equal to, the 'green fat' of the turtle. Here is a hint for our own aldermanic banquets; and after this, let no man, while devouring oysters, cockles, and mussels, venture to sneer at a mess of sea-slugs.

But now the plot thickens. Our next dish is a grand affair: it consists of *sturgeons' skull-caps*. This is a rare and expensive dainty, as of course the sturgeon has to be killed, like an Indian warrior, for his *scalp*; or as fowls sometimes are in France, for the sake of their combs and gills, to fill up a *vol au vent*; or again, as the poor unhappy Strasbourg goose is for her liver. It may, however, be hoped that all the *refuse* portions of these animals are turned to some account, and may be applied to the sustentation of the ordinary sort of men, although a contrary impression, so far as it relates to the sturgeon, seems to

have been produced on the mind of Our Correspondent. No doubt, after the Gallery was served with the cap, other people would be glad to take up with the remainder of the royal fish.

As to flavour, the skull-caps seemed to eat very much like the birds-nests, gelatine being decidedly in the ascendant in both cases.

After this came 'a soup composed of balls of crab.' This is too vague to satisfy our curiosity. Was the soup made on a 'stock' of shin of beef, or chine of dog, and then merely added to and decorated with the 'balls of crab,' as our own mock-turtle is with little imitation eggs? Further information would be desirable, and we hope the next dispatches will be more explicit.

All this time, there appears to have been a great preponderance of the rich and luscious sort of viands; and we felt quite astounded at the discovery that neither bread nor other farinaceous matter was supplied as an absorbent. This is 'against the statute' in Chinese feasts; and we venture to suggest as a reason, that the 'corners' are too precious as stowage for choicer morsels, to be wasted upon such common affairs as rice or bread. Our English friends, however, could not go on swallowing all this mucilaginous matter without something of the kind; and so, as a special favour, some bread was conceded to them; and we really feel a sort of relief ourselves as we record the fact: such is the force of sympathy in generous minds.

While all this was going on, nectar was supplied by Celestial Ganymedes, in the shape of warm wine, with which the tiny cups were repeatedly filled. The favourite variety with our countrymen was something closely resembling sherry negus, and pronounced very fair drink in its way, when better could not be had.

We are next introduced to a stew of preserved fruits; then comes a dish of some sort of vegetable of a hairy description, resembling that species of endive which in France is called *barbe du capucin*. After that, stewed mushrooms from Manchouria; and then we relapse into a series of *entrées* of various sorts, in which a root, 'something between a turnip and a horseradish' (the black radish?) meets with much approbation.

And now, reader, would have been the moment for the interrogatory 'quack, quack?' noticed at the beginning of this paper, according to all the rules of dramatic propriety; for the next dish is nothing less than 'a bowl of ducks' tongues,' to which, no doubt, ample justice was done; and here again is a delicacy which we in our wisdom throw away.

The 'royal and imperial dish' follows next. This is a *compote of deers' tendons*. On reading this, our first impression was a doubt as to the power of any cooking to bring such a material into an eatable condition; but we are told that, on the contrary, it appeared in a tender and gelatinous form, 'after probably a week's boiling' to produce the desired result. These sinews come, it is said, from Tatary, and form—like the *pietra dura* of Italy, which they somewhat resemble in one respect, and the Gobelin tapestry of Paris—material for royal presents; and when a great man receives a consignment of the catgut, he usually celebrates the joyous event by some grand festivities. We need but to observe, further, that, cooked as it was, this dish only added a little more gelatine to the quantity already sent down 'red lane' by the guests whose progress we are thus faithfully recording.

The royal dish being despatched, there appears on the scene one composed of what we should have thought better eating—'earshell fish'; but as everything here below must have its limits somewhere, the guests found themselves at this juncture *hors de combat*.

A very sensible mode of declaring when people have eaten enough, has, it seems, been adopted in China since the days of *Confusion*, as we once heard the Chinese philosopher injuriously called. Thus, it is understood that no more food is needed when a dish is sent away untouched. This was, therefore, the signal for the close of the feast, for the earshells were reluctantly declined, waistcoat buttons being already on the strain to a rather perilous extent.

But, what have we said? Do our eyes inform us rightly, when we read that, after all this, the guests partook of 'plain boiled rice, confectionary, candied fruit, and acanthus berries steeped in spirits?' It is even so, and confirms the adage that we do not know what we can do till we try.

It deserves to be recorded to the credit of the Chinese *maitre d'hôtel*, that he had in reserve some dozens more of the triumphs of his art, fully as *recherchés* as those already chronicled here; but which, for the reason stated, did not appear. What they were, therefore—from what region procured—what portion they may once have been of the organism of fish, flesh, or fowl, remains only as a subject of ingenious and interesting speculation.

So ended John Bull's dinner at Ning-po. We should have liked to call next morning, and ask how he felt himself; but our anxiety was quite dissipated by his own assurance, that the guests of the banquet we have been describing met the same evening and made a hearty supper, at the house of one of their number. We therefore take leave of them, trusting that they all had, in the words of our poet—adapted to the occasion by a slight change in the punctuation—

A fair, good, night;
With pleasing dreams, and slumbers light.

For our own part, we must confess that we live with the fear of *dyspepsia* before our eyes, and that, unwarlike—cowardly, if you will—as we are, we should almost as soon have clutched a musket at the siege of Delhi as have been forced to stand to it, chop-stick in hand, beside our countrymen on this memorable occasion. Had we tried our gastro-dynamic powers to the same extent as they did, we should have had a nightmare of no ordinary sort, and our visions would doubtless have been influenced by the events of the day. Huge sturgeons, like scalped Indians, would have grinned at us, and with horrid grimaces, called on us to restore their skull-caps. Flocks of melancholy and reproachful swallows would have fluttered round us, and pecked at our eyes as the ruthless plunderer who had not only stolen, but actually eaten their houses. We should have been afflicted with a 'cruel conscientiousness' that we had the missing property somewhere about us; that we were willing to make restitution, but could not, for the life of us, lay our hands upon it for the purpose. Crabs would have nibbled at our toes, and sea-slugs would have trailed their slow and slimy length over our shuddering body. We should have had a ride in the Mazepa fashion, on the back of a Tartar deer—the first time that a man's *dear* and his *tartar* were identified. We should have been 'found drowned' in an ocean of gluey mucilaginous soup; and a whole regiment of ducks would, in spite of the apparent impossibility of speaking while deprived of the very organ of speech, have clamoured for their tongues in a polyglot and most deafening chorus of 'quack! quack!'

Such being the case, it is just as well, gentle reader, that we should be quietly penning these lines in an attic region, while digesting our solitary mutton-chop, eaten with a German-silver fork for a chop-stick, and with a roasted potato, a modicum of bread, a pickled gherkin for condiment, and a moderate irrigation of half a pint of bitter beer.

We must confess that Our Correspondent has

shewn us that a gelatinous dinner can be digested, if we had ever doubted the fact: but although he has made a good move, and taken one of our best pieces, we cannot give up the game, or allow that we are as yet check-mated; but the controversy must now be let fall into abeyance, not for want of matter, but for lack of space to carry it further at the present moment.

ENGLISH HEARTS AND HANDS.

THIS is the title of a very remarkable little book lately published, and already widely circulated. Its object is twofold: to place a long dreaded and despised race of men, according to the phrase of one of their number, 'straighter with other people;' and to shew how much power for good lies latent within the grasp of 'men and women placed by God's providence in another position of life.' The book itself we owe to the fact that, 'early in the year 1853, nearly three thousand railway excavators were gathered from different parts of the kingdom to work at the grounds of the Crystal Palace at Sydenham,' and that of these men, 'two hundred lodged in the village of Beckenham,' the home of the writer.

Railways have run down many a prejudice in their unswerving track: landowners who once protested against them as a wrong, have long learned to welcome them as a boon; the profit, convenience, social interests of a neighbourhood, are all on their side; nay, our sense of beauty even has accommodated itself to their intrusion into some of our most picturesque scenes; but it was reserved for these pages effectually to dispel the still lingering impressions that no large bodies of this hitherto Pariah race could be quartered in a country neighbourhood without injury to its peace and respectability; to shew us that actually 'two or three hundred navvies could take up their abode in a country village for two winters, and instead of spreading moral contagion, set a good example to many of its inhabitants.'

Looking over the touching narrative before us, we find, as indeed we usually do, that a great work had a small beginning. It was on Sunday, the 13th of March 1853, that the writer first attempted to seek the navvies out. 'About seven in the evening' she went to 'a cottage where several were lodging, and asked for one of the family, as an easy introduction to the strangers.' Undaunted by the announcement that they were a 'lot of rough uns,' she entered, 'inquired if any of them had been at church—not one of them had thought of it!'—gave them an account of the morning's sermon; spoke of the important subjects most closely intertwined with every conviction of her own mind, every feeling of her own heart; linked these as they had never been linked before with the wants and spiritual instincts of those whom she addressed; and, in short, concluded this introduction, by melting them to tears, and left them her fast friends and loyal subjects! From that time forward, meetings for similar intercommunications were held on Sunday evenings, and twice in the week, and these were soon attended by the navvies in large numbers. Nor were their pleasures unthought of. A tea-party was devised. 'The school-room was decorated with festoons of flowers, and a button-hole bouquet of geranium and jessamine tied up with blue ribbon, and laid upon each plate.' We do not wonder that 'long afterwards some of these flowers were seen carefully preserved in books!' A pleasant sight that school-room must have afforded that summer-day! 'To a minute, our friends arrived, each man looking as clean as a baby on its christening-day. They quietly and quickly seated themselves, and no gentlemen in the united

kingdom could have conducted themselves more admirably.'

Nor was the softening, elevating, refining influence unexerted even when distance removed 'their lady' from her true-hearted friends. Letters were frequently exchanged, and numbers are given in the book before us, simple, earnest, manly—such letters as do honour to England's working-men.

'On the last day of 1853, the sergeant of police stationed at Beckenham called to return thanks for the interest that had been taken in these noble fellows. He said that his duty had never been so easy before in Beckenham, for their example had restrained the wilder young men of the place, and even shamed a few into attendance at public worship.'

The good work went on throughout 1854. More and more stout hearts were bent beneath the same spell. We read of many a victory over the working-man's direct temptation, drunkenness. We read, it is true, of relapses into the cruel hold of the inveterate habit; but the fallen are not forsaken—they are followed after, reclaimed by tenderness and tears: the gentle hand, strong to rescue, is stretched out again and again, and most of the strugglers triumph in the end. Several of the Crystal Palace navvies having enlisted, we have a number of letters given from different barracks, all expressing a grateful remembrance of Beckenham influences, and shewing how permanent these were in new scenes and under new forms of temptation.

In 1855, we read: 'A new interest sprung up for us in the gathering of the Army Works Corps. This corps, formed by the suggestion, and under the arrangement of Sir J. Paxton, amounted from first to last to nearly 4000 men—railway labourers, artisans of various kinds, smiths, stone-masons, bricklayers. The first ship was to sail early in July, the last about the middle of December.' 'News was brought to the Beckenham rectory on the 19th of May that several strangers had arrived to look for lodgings in the village.' The time was short, indeed, but to such a one as the writer of the book before us, this was no reason for giving up the work, but rather for the doing it with all her might. The new-comers, indeed, were described as 'the roughest lot as ever came to Beckenham.' 'At the first words addressed to them, they looked surprised, and somewhat disposed to look away;' but they were no more proof than their predecessors had been against the magic of an exquisite sympathy, and the unerring tact of a wise and loving heart. In her own words, always the best: 'We met them with friendly interests; they returned it with generous sympathy.'

The impression thus made was so strong, that the poor fellows longed to communicate it to others. One, after conferring with his friends, remarked: 'I wish the whole lot could hear these things. We're all together outside the Crystal Palace at seven of a morning, and the paymaster says we're the finest lot he ever saw, and the mildest—just like four hundred roaring lions.'

The following morning at the early hour named, a carriage from Beckenham was on its way to the ground, where about fifty men were already gathered. The carriage was sent away. 'Conversation easily followed, and by the time the remainder of the four hundred began to make their appearance, the first fifty had become our firm friends; not one uncivil word was said, not one unwilling hand received the prayer.'

This drive to the 'place appointed for the roll-call each morning,' became a regular thing. Invitations to 'cottage-readings' were given, a parting breakfast-party arranged, friendships formed. The ship not sailing at the time appointed, a 'round robin' was

addressed to their benefactress by the navvies, pressingly requesting her return from Essex, whither she had gone, 'to give them some more good advice before they should go away from their own country, perhaps never to return.' This perfect confidence in her 'care for them' is surely very touching. On the 18th of June, an early visit was paid to the Crystal Palace grounds; not only to take leave, but to 'take charge of any portion of their large wages which they chose to empower me to receive during their engagement in the Crimea. . . . Not only wives and children were thus provided for, but amongst the majority, who had no such ties, an aged mother, an infirm father, a widowed sister, a sickly brother, or orphan niece, were remembered with a generous care for their comfort.' Stamped receipts for money-orders being given to the men, they were 'flung back by common consent, with something like a shout of disdain, at the supposition that they could possibly require such a pledge from a friend and a lady.'

From that time till their departure, these men 'visited the rectory at all hours on their pecuniary matters,' and many an opportunity of quiet inter-communion was thus afforded its inmates. On the morning of the 21st of June, on the occasion of the final visit to the Crystal Palace grounds, the writer tells us: 'After shaking hands with each man, I took my leave, but was requested by an official to return, to hear the subject of a communication which had been passing from the men to the foremen of the corps. It was to express the united wish of these warm and grateful hearts that I should go out with them to the Crimea, to keep them straight, and to be with any of them who should die out there in their last hours. And they humbly begged to know if they might take the best place on board for me, and pay for it amongst themselves. It went to my heart to refuse them. . . . But when I explained to them the sacred home duties which withheld me from leaving England, they recognised them at once as paramount claims, and satisfied themselves by asking for a promise of one more farewell visit on board their ships.'

These farewell visits were paid upon the occasion of the sailing of each ship that bore away the Army Works Corps. Of these ships, the *Jura* was the last; she left England on the December of 1855, with her complement of five hundred men. A very touching incident in connection with this final visit well deserves to be given in full. Two men having borrowed half a sovereign each, came to the rectory to repay it the evening before their departure. 'Are you sure, my friends,' said their benefactress, 'that you can afford to give it back?'

'Quite sure, and thank you, ma'am, a thousand times.'

'When we met on board ship, we found that whilst other men had been laying out from ten to twenty shillings apiece in warm vests, John and James had been obliged to do without them, to enable them to repay their debts. . . . It was not to be borne. So, early in the day, we despatched a messenger for four warm knitted vests from London. Five o'clock came—our messenger had not returned. There was plainly some mistake. . . .

'The colder blew the night-breezes about us, as we drove through Deptford, the more unbearable was the thought of these two men suffering for their high and delicate sense of honour towards us. . . . At the fifth shop searched, the articles of clothing which we wanted were obtained. But who was to take them back to the ship? No shopman could be spared.

'Beneath a lamp in the street stood a group of boys; its light fell on a face which seemed to introduce the sort of messenger I desired. The story was told

him. "Now, my boy, we are strangers, and I do not want to know your name or where you live. You might take these vests, and sell or give them away as you choose, I should never send the police after you; but my confidence in the honour of English boys, which stands so high now, would be broken down, and those two nobly honest men would suffer, and might take cold, and go into consumption and die, and their wives and children break their hearts about them."

'The boy's eyes flashed under the lamp-light, and snatching the parcel, he said: "Trust me. I'm the boy for it."

'Eighteenpence happened to be the worldly all we had with us, after paying for the vests. I told him how sorry I was for this.

'It's a plenty. Father's a waterman. I shall get his boat for nothing. All's right!" and off he ran. . . .

'The next day passed, and the next, but no letter from the *Jura*. We read in the *Times* that she had sailed on Thursday morning. The day-posts of Saturday arrived, but brought no news of the parcel.

'My trust failed. "My boy is dishonest," I said; "and my confidence in human honour can never be the same again."

'But by the last post on Saturday evening came a note to say that about seven o'clock on Wednesday evening a boy had brought a parcel on board, and had requested permission to deliver it to James P— and John M—.

'Having discharged his duty, the last sound heard amidst the splashing of his oars as he left the ship's side was the shout: "Tell that 'ere lady I kept my word, and the jackets was in time."

They were gone then, the last of this bold, brave, yet tender-hearted band; gone without their guardian angel, to face the many toils and dangers of the camp before Sebastopol. But the strong silken ties of protecting and of grateful love were not overstrained by distance. 'The correspondence with the men themselves began to average about fifty letters a week from the Crimea;' and the receipts arising from the men's money-orders averaged about £500 a month. Many died in that far-off land—and we have touching accounts given in letters from their mates of some who remembered Beckenham teaching to the very last. On the 8th of May 1856, the *Cleopatra* brought 600 men of the Army Works Corps safely back to English ground. 'From that time,' says the narrator, 'until the last detachment of working-men landed from the Crimea, we were in the habit of keeping open house for their visits. . . . Pleasant was it to hear their short strong statements of not having forgotten us in the Crimea.' 'Once we heard as you was dead, and nigh two thousand of us ran together and prayed God it wasn't true.' And again: 'Whenever any more comed over, we said first thing: "Been to Beckenham, mates? How was they?"'

We conclude this short abstract by a few remarks. Plainly the influence we have seen exerted by a refined and accomplished woman over large bodies of men of the roughest class was remarkable both in kind and in degree. What was its secret? We answer in her own words: 'The working-man values your courtesy above your liberality, and your friendship most of all. Shew him your interest in his welfare, your desire for his improvement, your care for his happiness, and, above all, your trust in his honour. Let him feel that he can give back as much as he gains. . . . Allow him the glorious equality of being able to repay friendship with friendship.'

A word to the many who will read this book with beating heart and tearful eyes, and a sudden and enthusiastic yearning to exercise a like influence. It

is not to discourage that we would say to such: Before you can do what the author has done, you must be what she is: your convictions must be as intense, your experience as confirmatory of them. 'The tone of seeking is one thing, the tone of having is another.'

One word, too, to our working-brothers: Give us credit for much unexpressed sympathy. We often stand aloof, not because our hearts are cold, but because they are timid. We yearn for closer kindredship than we venture to seek. Our minds are narrowed by conventional restrictions; we feel powerless to arrest your attention or to win your confidence. But we have blessed our more gifted sister as we have read of what she has done; and we appreciate to the full the rich reward she meets with in the affection of natures so noble and so tender as yours.

O Ç E O L A:

A ROMANCE.

CHAPTER XXXVII.—THE FINAL ASSEMBLY.

THE spectacle of yesterday was repeated: the troops in serried lines of blue and steel—the officers in full uniform with shining epaulettes—in the centre the staff grouped around the general, close buttoned and of brilliant sheen; fronting these the half-circle of chiefs, backed by concentric lines of warriors, plumed, painted, and picturesque—horses standing near, some neighing under ready saddles, some picketed and quietly browsing—Indian women in their long *ammas*, hurrying to and fro—boys and babes at play upon the grass—flags waving above the soldiers—banners and pennons floating over the heads of the red warriors—drums beating—bugles braying; such was the array.

Again the spectacle was imposing, yet scarcely so much as that of the preceding day. The eye at once detected a deficiency in the circle of the chiefs, and nearly half of the warriors were wanting. The assemblage no longer impressed you with the idea of a multitude—it was only a respectable crowd, with room enough for all to gather close around the council.

The absence of many chiefs was at once perceived. King Onopa was not there. The coronet of British brass—lackered symbol of royalty, yesterday conspicuous in the centre—was no longer to be seen. Holata Mico was missing, with other leaders of less note; and the thinness in the ranks of the common warriors shewed that these chiefs had taken their followers along with them. Most of the Indians on the ground appeared to be of the clans of Omatia, 'Black Dirt,' and Ohala.

Notwithstanding the fewness of their following, I saw that Hoitle-mattee, Arpiucki, negro Abram, and the Dwarf were present. Surely these stayed not to sign?

I looked for Oçoola. It was not difficult to discover one so conspicuous, both in figure and feature. He formed the last link in the now contracted curve of the chiefs. He was lowest in rank, but this did not signify, as regarded his position. Perhaps he had placed himself there from a feeling of modesty—a well-known characteristic of the man. He was in truth the very youngest of the chiefs, and by birth-right entitled to a smaller command than any present; but, viewing him as he stood—even at the bottom of the rank—one could not help fancying that he was the head of all.

As upon the preceding day, there was no appearance of bravado about him. His attitude, though stately and statuesque, was one of perfect ease. His arms were folded over his full chest—his weight resting on one limb, the other slightly retired—his

features in repose, or now and then lit up by an expression rather of gentleness. He seemed the impersonation of an Apollo—or, to speak less mythologically, a well-behaved gentleman waiting for some ceremony, of which he was to be a simple spectator. As yet, nothing had transpired to excite him; no words had been uttered to rouse a spirit that only seemed to slumber.

Ere long, that attitude of repose would pass away—that soft smile would change to the harsh frown of passion.

Gazing upon his face, one could hardly fancy such a transformation possible, and yet a close observer might. It was like the placid sky that precedes the storm—the calm ocean that in a moment may be convulsed by the squall—the couchant lion that on the slightest provocation may be roused to ungovernable rage.

During the moments that preceded the inauguration of the council, I kept my eyes upon the young chief. Other eyes were regarding him as well; he was the cynosure of many—but mine was a gaze of peculiar interest.

I looked for some token of recognition, but received none—neither nod nor glance. Once or twice, his eye fell upon me, but passed on to some one else, as though I was but one among the crowd of his pale-faced adversaries. He appeared not to remember me. Was this really so? or was it, that his mind, pre-occupied with great thoughts, hindered him from taking notice?

I did not fail to cast my eyes abroad—over the plain—to the tents—towards the groups of loitering women. I scanned their forms, one after another.

I fancied I saw the mad queen in their midst—a centre of interest. I had hoped that her *protégée* might be near; but no. None of the figures satisfied my eye: they were all too *equus-like*—too short or too tall—too corpulent or too *maigre*. She was not there. Even under the loose *hanna* I should have recognised her splendid form—if still unchanged.

If—the hypothesis excites your surprise. Why changed, you ask? Growth?—development?—maturity? Rapid in this southern clime is the passage from maiden's form to that of matron.

No; not that, not that. Though still so young, the undulating outlines had already shewn themselves. When I last looked upon her, her stature had reached its limits; her form exhibited the bold curve of Hogarth, so characteristic of womanhood complete. Not that did I fear.

And what then? The contrary? Change from attenuation—from illness or grief? Nor this.

I cannot explain the suspicions that racked me—sprung from a stray speech. That jay bird, that yestreen chattered so gaily, had poured poison into my heart. But no; it could not be Maïmeé? She was too innocent. Ah! why do I rave? There is no guilt in love. If true—if she—hers was not crime; he alone was the guilty one.

I have ill described the torture I experienced, consequent upon my unlucky 'eaves-dropping.' During the whole of the preceding day, it had been a source of real suffering. I was in the predicament of one who had heard too much, and too little.

You will scarcely wonder that the words of Haj-Ewa cheered me; they drove the unworthy suspicion out of my mind, and inspired me with fresh hopes. True, she had mentioned no name till I myself had pronounced it; but to whom could her speech refer? 'Poor bird of the forest—her heart will bleed and break.' She spoke of the 'Rising Sun': that was Oçoola. Who could the 'haintclitz' be? who but Maïmeé?

It might be but a tale of bygone days—a glimpse of the past deeply impressed upon the brain of the

maniac, and still living in her memory. This was possible. Haj-Ewa had known us in those days, had often met us in our wild wood rambles, had even been with us upon the island—for the mad queen could paddle her canoe with skill, could ride her wild steed, could go anywhere, went everywhere.

It might be only a souvenir of these happy days that caused her to speak as she had done—in the chaos of her intellect, mistaking the past for the present. Heaven forbid!

The thought troubled me, but not long; for I did not long entertain it. I clung to the pleasanter belief. Her words were sweet as honey, and formed a pleasing counterpoise to the fear I might otherwise have felt, on discovering the plot against my life. With the knowledge that Maimee had once loved—still loved me—I could have dared dangers a hundredfold greater than that. It is but a weak heart that would not be gallant under the influence of love. Encouraged by the smiles of a beautiful mistress, even cowards can be brave.

Arens Ringgold was standing by my side. Entrained in the crowd, our garments touched; we conversed together!

He was even more polite to me than was his wont—more *friendly*! His speech scarcely betrayed the habitual cynicism of his nature; though, whenever I looked him in the face, his eye quailed, and his glance sought the ground.

For all that, he had no suspicion—not the slightest—that I knew I was side by side with the man who designed to murder me.

CHAPTER XXXVIII.

CASHIERING THE CHIEFS.

To-day the commissioner shewed a bolder front. A bold part he had resolved to play, but he felt sure of success; and consequently there was an air of triumph in his looks. He regarded the chiefs with the imperious glance of one determined to command them; confident they would yield obedience to his wishes.

At intervals his eye rested upon Ogeola with a look of peculiar significance, at once sinister and triumphant. I was in the secret of that glance: I guessed its import; I knew that it boded no good to the young Seminole chief. Could I have approached him at that moment, I should have held duty but lightly, and whispered in his ear a word of warning.

I was angry with myself that I had not thought of this before. Haj-Ewa could have borne a message on the previous night; why did I not send it? My mind had been too full. Occupied with my own perils, I had not thought of the danger that threatened my friend—for in this light I still regarded Powell.

I had no exact knowledge of what was meant; though, from the conversation I had overheard, I more than half divined the commissioner's purpose. Upon some plea, *Ogeola was to be arrested.*

A plea was needed; the outrage could not be perpetrated without one. Even the reckless agent might not venture upon such a stretch of power without plausible pretext; and how was this pretext to be obtained?

The withdrawal of Onopa and the 'hostiles,' while Omatla with the 'friendlies' remained, had given the agent the opportunity. *Ogeola himself was to furnish the plea.*

Would that I could have whispered in his ear one word of caution!

It was too late: the toils had been laid—the trap set; and the noble game was about to enter it. It was too late for me to warn him. I must stand idly by—spectator to an act of injustice—a gross violation of right.

A table was placed in front of the ground occupied by the general and staff; the commissioner stood immediately behind it. Upon this table was an ink-stand with pens; while a broad parchment, exhibiting the creases of many folds, was spread out till it occupied nearly the whole surface. This parchment was the treaty of the Oclawaha.

'Yesterday,' began the commissioner, without further preamble, 'we did nothing but talk—to-day we are met to act. This,' said he, pointing to the parchment, 'is the treaty of Payne's Landing. I hope you have all considered what I said yesterday, and are ready to sign it?'

'We have considered,' replied Omatla for himself and those of his party. 'We are ready to sign.'

'Onopa is head-chief,' suggested the commissioner; 'let him sign first. Where is Miconopa?' he added, looking around the circle with feigned surprise.

'The mico-mico is not here.'

'And why not here? He should have been here. Why is he absent?'

'He is sick—he is not able to attend the council.'

'That is a *lie*, Jumper. Miconopa is shamming—you know he is.'

The dark brow of Hoitle-mattee grew darker at the insult, while his body quivered with rage. A grunt of disdain was all the reply he made, and folding his arms, he drew back into his former attitude.

'Abram! you are Miconopa's private counsellor—you know his intentions. Why has he absented himself?'

'O Masser Ginral!' replied the black in broken English, and speaking without much show of respect for his interrogator, 'how shed ole Abe know the 'tention ob King Nopy? The mico no tell me ebberting—he go he please, he come he please—he great chief; he no tell nobody his 'tention.'

'Does he intend to sign? Say yes or no.'

'No, den!' responded the interpreter in a firm voice, as if forced to the answer. 'That much ob his mind Abe *do* know. He no 'tend sign that ar dockament. He say no, no.'

'Enough!' cried the commissioner in a loud voice—'enough! Now hear me, chiefs and warriors of the Seminole nation! I appear before you armed with a power from your Great Father the President—he who is chief of us all. That power enables me to punish for disloyalty and disobedience; and I now exercise the right upon Miconopa. *He is no longer king of the Seminoles!*'

This unexpected announcement produced an effect upon the audience similar to that of an electric shock. It startled the chiefs and warriors into new attitudes, and all stood looking eagerly at the speaker. But the expression upon their faces was not of like import—it varied much. Some shewed signs of anger as well as surprise. A few appeared pleased, while the majority evidently received the announcement with incredulity.

Surely the commissioner was jesting? How could he make or unmake a king of the Seminoles? How could the Great Father himself do this? The Seminoles were a free nation; they were not even tributary to the whites—under no political connection whatever. They themselves could alone elect their king—they only could depose him. Surely the commissioner was jesting?

Not at all. In another moment, they perceived he was in earnest. Foolish as was the project of deposing King Onopa, he entertained it seriously. He had resolved to carry it into execution; and as far as decrees went, he did so without further delay.

'Omatla! you have been faithful to your word and your honour; you are worthy to head a brave nation. From this time forth, you are king of the Seminoles. Our Great Father, and the people of the United

States, hail you as such; they will acknowledge no other. Now—let the signing proceed.'

At a gesture from the commissioner, Omatla stepped forward to the table, and taking the pen in his hand, wrote his name upon the parchment.

The act was done in perfect silence. But one voice broke the deep stillness—one word only was heard uttered with angry aspirate; it was the word 'traitor!'

I looked round to discover who had pronounced it; the hiss was still quivering upon the lips of Oçola; while his eye was fixed on Omatla with a glance of ineffable scorn.

'Black Crazy Clay' next took the pen, and affixed his signature, which was done by simply making his 'mark.'

After him followed Ohala, Itolasse Omatla, and about a dozen—all of whom were known as the chiefs that favoured the scheme of removal.

The hostile chiefs—whether by accident or design I know not—stood together, forming the left wing of the semicircle. It was now their turn to declare themselves.

Hoitle-mattee was the first about whose signing the commissioner entertained any doubt. There was a pause, significant of apprehension.

'It is your turn, Jumper,' said the latter at length, addressing the chief by his English name.

'You may jump me then,' replied the eloquent and witty chief, making a jest of what he meant for earnest as well.

'How? you refuse to sign?'

'Hoitle-mattee does not write.'

'It is not necessary; your name is already written; you have only to place your finger upon it.'

'I might put my finger on the wrong place.'

'You can sign by making a cross,' continued the agent, still in hopes that the chief would consent.

'We Seminoles have but little liking for the cross; we had enough of it in the days of the Spaniards. *Huhook!*'

'Then you positively refuse to sign?'

'Ho! Mister Commissioner, does it surprise you?'

'Be it so, then. Now hear what I have to say to you.'

'Hoitle-mattee's ears are as open as the commissioner's mouth,' was the sneering rejoinder.

'I depose Hoitle-mattee from the chieftainship of his clan. The Great Father will no longer recognise him as a chief of the Seminoles.'

'Ha, ha, ha!' came the scornful laugh in reply.

'Indeed—indeed! And tell me,' he asked, still continuing to laugh and treating with derision the solemn enunciation of the commissioner, 'of whom am I to be chief, General Thompson?'

'I have pronounced,' said the agent, evidently confused and nettled by the ironical manner of the Indian; 'you are no more a chief—we will not acknowledge you as one.'

'But my people?—what of them?' asked the other in a fine tone of irony; 'have they nothing to say in this matter?'

'Your people will act with reason. They will listen to their Great Father's advice. They will no longer obey a leader who has acted without faith.'

'You say truly, agent,' replied the chief, now speaking seriously. 'My people will act with reason, but they will also act with patriotism and fidelity. Do not flatter yourself of the potency of our Great Father's advice. If it be given as a father's counsel, they will listen to it; if not, they will shut their ears against it. As to your disposal of myself, I only laugh at the absurdity of the act. I treat both act and agent with scorn. I have no dread of your power. I have no fear for the loyalty of my people. Sow dissension among them as you please;

you have been successful elsewhere in making traitors—here the speaker glared towards Omatla and his warriors—'but I disregard your machinations. There is not a man in my tribe that will turn his back upon Hoitle-mattee—not one.'

The orator ceased speaking, and folding his arms, fell back into an attitude of silent defiance. He saw that the commissioner had done with him, for the latter was now appealing to Abram for his signature.

The black's first answer was a decided negative—simply 'No.' When urged to repeat his refusal, he added:

'No—by Jovah! I nebber sign de d—paper—nebber. Dat's enuf—ain't it, Bossy Thompson?'

Of course this put an end to the appeal, and Abram was 'scratched' from the list of chiefs.

Arpiucki followed next, and 'Cloud' and the 'Alligator,' and then the dwarf Poshalla. All these refused their signatures, and were in turn formally deposed from their dignities. So, likewise, were Holata Mico and others who were absent.

Most of the chiefs only laughed as they listened to the wholesale cashiering. It was ludicrous enough to hear this puny office-holder of an hour pronounce edicts with all the easy freedom of an emperor!*

Poshalla, the last who had been disgraced, laughed like the others; but the dwarf had a bitter tongue, and could not refrain from a rejoinder.

'Tell the fat agent,' cried he to the interpreter—'tell him that I shall be a chief of the Seminoles when the rank weeds are growing over his great carcass—ha, ha!'

The rough speech was not carried to the ears of the commissioner. He did not even hear the scornful cachinnation that followed it, for his attention was now entirely occupied with one individual—the youngest of the chiefs—the last in the line—Oçola.

CHAPTER XXXIX.

THE SIGNATURE OF OÇOLA.

Up to this moment the young chief had scarcely spoken; only when Charles Omatla took hold of the pen, he had hissed out the word traitor.

He had not remained all the time in the same attitude, neither had his countenance shewn him indifferent to what was passing. There was no constraint either in his gestures or looks—no air of affected stoicism—for this was not his character. He had laughed at the wit of Jumper, and applauded the patriotism of Abram and the others, as heartily as he had frowned disapproval of the conduct of the traitors.

It was now his turn to declare himself, and he stood, with modest mien, in the expectation of being asked. All the others had been appealed to by name—for the names of all were well known to the agent and his interpreters.

I need hardly state that at this crisis silence was on tiptoe. Throughout the ranks of the soldiery—throughout the crowd of warriors—everywhere—there was a moment of breathless expectancy, as if every individual upon the ground was imbued with the presentiment of a scene.

For my part, I felt satisfied that an explosion was about to take place; and, like the rest, I stood spell-bound with expectation.

The commissioner broke silence with the words:

'At last we come to you, *Powell*. Before proceeding further, let me ask—Are you acknowledged as a chief?'

There was insult in the tone, the manner, the

* The United States government afterwards disapproved of this absurd dethronement of the chiefs; but there is no doubt that Thompson acted under secret instructions from the President.

words. It was direct and intended, as the countenance of the speaker clearly shewed. There was malice in his eye—malice mingled with the confidence of prospective triumph.

The interrogation was irrelevant, superfluous. Thompson knew well that Powell was a chief—a sub-chief, it is true, but still a chief—a war-chief of the Redsticks, the most warlike tribe of the nation. The question was put for mere provocation. The agent tempted an outburst of that temper that all knew to be none of the gentlest.

Strange to say, the insult failed in its effect, or it seemed so. They who expected an angry answer were doomed to disappointment. Oçeola made no reply. Only a peculiar smile was observed upon his features. It was not of anger, nor yet of scorn: it was rather a smile of silent, lordly contempt—the look which a gentleman would bestow upon the blackguard who is abusing him. Those who witnessed it were left under the impression that the young chief regarded his insulter as beneath the dignity of a reply, and the insult too gross, as it really was, to be answered. Such impression had I, in common with others around me.

Oçeola's look might have silenced the commissioner, or, at least, have caused him to change his tactics, had he been at all sensitive to derision. But no—the vulgar soul of the plebeian official was closed against shame, as against justice; and without regarding the repulse, he pressed on with his plan.

'I ask, are you a chief?' continued he, repeating the interrogatory in a still more insulting tone. 'Have you the right to sign?'

This time his questions were answered, and by a dozen voices at once. Chieftains in the ring, and warriors who stood behind it, shouted in reply:

'The Rising Sun?—a chief! He is a chief. He has the right to sign.'

'Why call his right in question?' inquired Jumper, with a sneering laugh. 'Time enough when he wishes to exercise it. He is not likely to do that now.'

'But I am,' said Oçeola, addressing himself to the orator, and speaking with marked emphasis. 'I have the right to sign—I shall sign.'

It is difficult to describe the effect produced by this unexpected avowal. The entire audience—white men as well as red men—was taken by surprise; and for some moments there was a vibratory movement throughout the assembly, accompanied by a confused murmur of voices. Exclamations were heard on all sides—cries of varied import, according to the political bias of those who uttered them. All, however, betokened astonishment: with some, in tones of joy; with others, in the accents of chagrin or anger. Was it Oçeola who had spoken? Had they heard aright? Was the 'Rising Sun' so soon to sink behind the clouds? After all that had transpired—after all he had promised—was he going to turn traitor?

Such questions passed rapidly among the hostile chiefs and warriors; while those of the opposite party could scarcely conceal their delight. All knew that the signing of Oçeola would end the affair; and the removal become a matter of course. The Omatlas would have nothing more to fear; the hostile warriors, who had sworn it, might still resist; but there was no leader among them who could bind the patriots together as Oçeola had done. With his defection, the spirit of resistance would become a feeble thing: the patriots might despair.

Jumper, Cloud, Coa Hajo, and Abram, Arpiucki, and the dwarf, seemed all equally stricken with astonishment. Oçeola—he on whom they had reposed their fullest confidence—the bold designer of the opposition—the open foe to all who had hitherto advocated the removal—he, the pure patriot in whom all had believed—whom all had trusted, was now

going to desert them—now, in the eleventh hour, when his defection would be fatal to their cause.

'He has been bribed,' said they. 'His patriotism has been all a sham; his resistance a cheat. He has been bought by the agent; he has been acting for him all along. *Holywaugus! Iste-hulwa-stchay.*' 'Tis a treason blacker than Omatla's!'

Thus muttered the chiefs to one another, at the same time eyeing Oçeola with the fierce look of tigers.

With regard to Powell's defection, I did not myself know what to make of it. He had declared his resolution to sign the treaty; what more was needed? That he was ready to do so was evident from his attitude: he seemed only to wait for the agent to invite him.

As to the commissioner being a party to this intention, I knew he was nothing of the kind. Any one who looked in his face, at that moment, would have acquitted him of all privy to the act. He was evidently as much astonished by Oçeola's declaration as any one upon the ground, or even more so; in fact, he seemed bewildered by the unexpected avowal; so much, that it was some time before he could make rejoinder.

He at length stammered out:

'Very well, Oçeola! Step forward here, and sign then.'

Thompson's tone was changed: he spoke soothingly. A new prospect was before him. Oçeola would sign, and thus agree to the removal. The business upon which the supreme government had deputed him would thus be accomplished, and with a dexterity that would redound to his own credit. 'Old Hickory' would be satisfied; and then what next? what next? Not a mission to a mere tribe of savages, but an embassy to some high court of civilisation. He might yet be ambassador? perhaps to Spain?

Ah! Wiley Thompson! thy castles in the air (*châteaux en Espagne*) were soon dissipated. They fell suddenly as they had been built: they broke down like a house of cards.

Oçeola stepped forward to the table, and bent over it, as if to scan the words of the document. His eyes ran rapidly across the parchment; he seemed to be searching for some particular place.

He found it—it was a name—he read it aloud: 'Charles Omatla.'

Raising himself erect, he faced the commissioner; and, in a tone of irony, asked the latter if he still desired him to sign.

'You have promised, Oçeola.'

'Then will I keep my promise.'

As he spoke the words, he drew his long Spanish knife from its sheath, and raising it aloft, struck the blade through the parchment till its point was deep buried in the wood.

'That is my signature!' cried he, as he drew forth the steel. 'See! Omatla! it is through your name. Beware, traitor! Undo what you have done, or its blade may yet pass through your heart!'

'Oh! that is what he meant,' cried the commissioner, rising in rage. 'Good. I was prepared for this insolence—this outrage. General Clinch!—I appeal to you—your soldiers—seize upon—arrest him!'

These broken speeches I heard amidst the confusion of voices. I heard Clinch issue some hurried orders to an officer who stood near. I saw half a dozen files separate from the ranks, and rush forward; I saw them cluster around Oçeola—who the next moment was in their grasp.

Not till several of the blue-coated soldiers were sent sprawling over the ground; not till guns had

been thrown aside, and a dozen strong men had fixed their gripe upon him, did the young chief give over his desperate struggles to escape; and then apparently yielding, he stood rigid and immobile, as if his frame had been iron.

It was an unexpected *dénouement*—alike unlooked for by either white men or Indians. It was a violent proceeding, and altogether unjustifiable. This was no court whose judge had the right to arrest for contempt. It was a council, and even the insolence of an individual could not be punished without the concurrence of both parties. General Thompson had exceeded his duty—he had exercised a power arbitrary as illegal.

The scene that followed was so confused as to defy description. The air was rent with loud ejaculations; the shouts of men, the screams of women, the cries of children, the yells of the Indian warriors, fell simultaneously upon the ear. There was no attempt at rescue—that would have been impossible in the presence of so many troops—so many traitors; but the patriot chiefs, as they hurried away from the ground, gave out their wild ‘Yo-ho-eh-eh’—the gathering war-word of the Seminole nation—that in every utterance promised retaliation and revenge.

The soldiers commenced dragging Oçoola inside the fort.

‘Tyrant!’ cried he, fixing his eye upon the commissioner, ‘you have triumphed by treachery; but fancy not that this is the end of it. You may imprison Oçoola—hang him, if you will—but think not that his spirit will die. No; it will live, and cry aloud for vengeance. It speaks! Hear ye yonder sounds? Know ye the “war-cry” of the Redsticks? Mark it well; for it is not the last time it will ring in your ears. Ho—yo-ho-eh-eh! yo-ho-eh-eh! Listen to it, tyrant! it is your death-knell—it is your death-knell!’

While giving utterance to these wild threats, the young chief was drawn through the gate, and hurried off to the guard-house within the stockade.

As I followed amid the crowd, some one touched me on the arm, as if to draw my attention. Turning, I beheld Haj-Ewa.

‘To-night, by the *we-wa*,’* said she, speaking so as not to be heard by those around. ‘There will be shadows—more shadows upon the water. Perhaps’—

I did not hear more: the crowd pressed us apart; and when I looked again, the mad queen had moved away from the spot.

BIRDS AS OBSERVED BY ME.

In my early days, birds of every kind were my friends, and much of my time was taken up watching them. I never studied much of their learned classification, nor did I ever care much about having any of my own; I simply was fond of them, and liked to watch their habits. I have often, when I ought to have been at school learning my lessons, stolen away to the wood, at the back of our house, to watch the motions of the titmice, or try to discover the exact tree whereon the cuckoo sat. And when I succeeded in getting a good view of the cuckoo, I found its attractions quite resistless, and would be chained to the spot as long as that strange bird remained on the tree. I was surprised at first—but I soon became accustomed to it—to find that the cuckoo uttered a low, harsh, grating sound, something like a gurgle in the throat, before giving forth the clear, dreamy *Ku-koo, Ku-koo*;

and I also noticed that when she left the tree, her flight seemed to be zigzag and uncertain, as if she could not make up her mind which tree to light on next. Soon after she left the tree, too, several little birds would twitter off, and follow the stranger wherever she went.

I had always thought—and I don’t know why I should have thought it—that the cuckoo frequented the neighbourhood of trees only; but I found her as frequently on the hillside, perched upon some stone, and calling *Ku-koo, Ku-koo*, just as she did in the wood. At first, I thought she must have strayed or been hunted by other birds from the woods; but when I afterwards saw other cuckoos on the hillside, I knew that she frequented both. I never saw a cuckoo far in the wood, but generally on the outskirts: tall elm-trees bordering parks or gardens seemed to be preferred to the middle of woods, and never very far from houses, which made me think the bird liked to be within sight of our dwellings.

During all my watchings, I never found the cuckoo molesting other birds, as the hawk does, and yet I could not help seeing that she was no favourite with her feathered brethren. This jealousy or natural spite was at times carried to great lengths; and I have seen a cuckoo’s enjoyment sadly marred by a little army of persecutors, and the very life of the bird endangered. It seemed to me that these tiny assailants took periodical fits of anger; for I have listened to a cuckoo in full song, when numerous little birds were in the neighbourhood, and observed that none of them noticed her presence excepting her body-guard—a pair of marsh-tits. On the other hand, during some days, a whole army of little birds would spend hours in pursuing their helpless victim, the air ringing with their screams of defiance and rage. Even at those times, the cuckoo occasionally emitted her notes while on the wing—not plaintively uttered, but just as usual, which always gave me the idea that the bird enjoyed the fun, and rather wished to lead her tormentors a gay chase, than hide herself from such overwhelming odds. These attacks took place, so far as ever I saw, only in the neighbourhood of trees. Her life was certainly more enjoyable amongst the hills: there, she flitted about from one stone to another, her flights usually extending to several hundred yards, at the same time accompanied or followed by her faithful friends, the marsh-tits.

Why they attended her, I never could quite find out, unless they acted as guards to warn the cuckoo of the intrusion of enemies, or as purveyors to supply her with food. I dare say if I had been a reader, I should have seen why the cuckoo was molested by many birds, why she was carefully guarded by some, and spitefully entreated by others; but I hated reading, and liked watching: so it was many a day before I found out the wonderful truth, that she lays her eggs in the nests of other birds. The first nest occupied by a young cuckoo which fell to my notice, was the water-wagtail’s: here I found the intruder one day in June. I was unprepared for any such discovery, and at first I did not know what to make of it; and it was not until his feathers began to come to maturity, that I ascertained the fact, and knew that the two wagtails already deprived of their rightful progeny, were toiling from morning till night to supply the voracious appetite of the young cuckoo. Nor did their cares cease when the bird left the nest; for I noticed that for some time afterwards, the foster-parents fetched food, which was eagerly devoured by this adventurer.

This is about all I can remember of the cuckoo; and many a holiday have I spent in her company. I was more led to watch her habits than those of any other birds, because they always appeared so strange and mysterious. Moreover, I loved to listen to the quiet notes, stealing through the warm air of June or July. I have said that I often stole a day from school to spend

* Spring, pond, or water.

among the copses and woods: these days were generally in June or July; and to this day I never can hear the notes *Ku-koo, Ku-koo*, without associating them with a certain guilt, felt long ago when I (too often) played truant.

Of all birds, I always thought the tits the most indefatigable in their search for food. They are not shy birds, but allow one to remain within a very few yards when they are at work. I remember they were fond of the silver birch-tree, and seemed to prefer a young or moderate-sized one to the full-grown tree. And of all the varieties of blue, greater, lesser long-tailed, and cole, the blue titmouse or ox-eye was the most active. Several kinds would often claim equal right to one tree, and each pursued its avocations without disturbing, or even noticing its neighbours. The blue tit preferred the branches to the stem, and the smaller sprays to the branches; and when one began searching its spray, it never left it till the search was complete. Back downwards was the favourite position; and every little chink in the bark was tried, tapped, and plundered. The plunder was minute insects, their eggs, chrysalles, and tiny caterpillars.

I used to suspect the tits were fond of seeds also, but of this I never was certain. From where the small branch sprung from the greater, and along its entire length, clung, traversed, and pecked, this tiny bird, accompanying the action with sundry low, shrill notes or squeaks; and when several tits were at work on one tree, these notes were constant. Their motions were very quick: a branch several feet long could be examined and plundered in a very few minutes—varying from half a minute to about four usually; and they reminded me of bees, for a few seconds sufficed to shew new-comers whether the branch had been previously visited by others. Their claws are well adapted for clinging, and their necks are very supple; so much so that the bird, while hanging to a horizontal branch of an inch or two in diameter, can twist its head round to the upper part, and examine and probe it, without changing its position. It generally confines itself, however, to the under part and sides of the branch.

The nest of the tit used to be an object of much delight to me. I never harried one, but seldom could resist putting my finger into the small hole at the side, to find if there were eggs or young birds. Such a colony—some dozen or more in one nest not larger than a cricket-ball: no wonder the parent tits require to make the best of their time to supply food for all at home. However, they manage to rear their numerous brood; but that would be impossible were both birds not constantly engaged in getting food. They may both stay away, too, from the nest for some time at a stretch, for it does not require the heat of the parent to keep the young ones warm in their dry ball of feathers.

Another little bird (the least of British birds, I believe), the wren, or katy-wren, as we used to call it, was strange in its habits. I always found it in hedgerows, or close to drains or small streams. Unless for its shrill note, I should seldom have noticed its whereabouts, for the colour of the wren is too dark to admit of the bird being easily seen. I never saw the wren feed. Its motions were very quick, and it seemed an easily scared bird. Its favourite resorts were up drains, or amongst the tangled briers that fringed the sides of some tiny brook: there it would sit, or hop from one little spray to another, emitting its sharp note, so loud for a bird of its size; and if startled from its retreat, would seek the nearest drain-mouth, and vanish. I always deemed the wren a shy bird, and cannot say it was ever a great favourite; but it had its mystery, too, for I never saw it feeding.

It puzzles one to remember the Latin names of

birds; and I always prefer home titles, such as the mavis, the robin, the ox-eye or yellow yorlin, to following them up with hard Latin words, such as *Troglodytes vulgaris*, which I have carefully copied from a book as the name given by naturalists to the katy-wren!

LOOKING EAST:

IN JANUARY 1858.

'Lover and friend hast Thou put far from me, and hid mine acquaintance out of my sight.'

LITTLE white clouds, where are you flying
Over the sky so blue and cold?
Fair faint hopes, why are you lying
Over my heart like a white cloud's fold?

Little green leaves, why are you peeping
Out of the mould where the snow yet lies?
Toying west wind, why are you creeping
Like a child's breath across my eyes?

Hope and terror by turns consuming,
Lover and friend put far from me—
What should I do with the bright spring's coming
Like an angel over the sea?

Over the cruel sea that parted
Me from mine—is't for evermore?
Out of the woful East, whence darted
Heaven's full quiver of vengeance sore.

Day teaches day—night whispers morning,
'Hundreds are weeping their dead, and thou
Weepest thy living! Rise, be adorning
Thy brows, unwidowed, with smiles.'—But how?

O had he married me—unto anguish,
Hardship, sickness, peril, and pain,
If on my breast his head might languish,
In lonely jungle or burning plain:

O had we stood on the rampart gory,
Till he—ere Horror behind us trod—
Kissed me, and killed me, and with his glory
My soul went happy and pure to God!

Nay, nay—God pardon me, broken-hearted,
Living this dreary life in death;
Many there are far wider parted
Who under one roof-tree breathe one breath.

But we *that loved*—whom one word half broken
Had drawn together close soul to soul,
As lip to lip—and it was not spoken,
Nor may be, while the world's ages roll.

I sit me down with the tears all frozen:
I drink my cup, be it gall or wine:
I know, if he lives, I am his chosen;
I know, if he dies, that he is mine.

If love in its silence be greater, stronger
Than hundred vows, or sighs, or tears,
Soul, wait thou on Him a little longer
Who holdeth the balance of thy years.

Little white clouds, like angels flying,
Bring the young spring from over the sea:
Loving or losing, living or dying,
Heaven, remember—remember me!

No. 220.

SATURDAY, MARCH 20, 1858.

PRICE 1½d.

THE WILD WHITE MAN.

In the year 1803, the British government, observing the successful progress of the convict settlement at Port Jackson, fitted out an expedition for the formation of a similar establishment on the southern coast of Australia. The great inland bay of Port Phillip had been explored during the previous year by Captain Flinders, in the *Investigator*; and his favourable report of the surrounding country greatly influenced the government in their choice of a locality.

The command of the expedition was given to Colonel Collins. The convicts—367 in number—were all males. Of these, only seventeen received permission for their wives to accompany them; and with the exception of seven little ones, who were too young to be left behind, their children were forbidden to undertake the long and dangerous voyage, which was then regarded with extreme distrust. A detachment of about fifty soldiers, with three lieutenants, formed the military guard; and various civil officers, four surgeons, and a chaplain and seven soldiers' wives, completed the *matériel* of the new settlement.

In these days of breathless enterprise, when our countrymen hurry to and fro over the whole earth, and undertake a voyage to the antipodes, or an expedition to the north pole, with equal coolness, it is interesting to note the gloomy forebodings of these early voyagers to the southern world. The means of so doing are furnished by the diary of the Rev. Robert Knopwood, chaplain to the expedition. 'The land behind us,' he writes, 'is the abode of civilised people; that before us, the residence of savages. When, if ever, we shall enjoy an intercourse with the world, is doubtful and uncertain. We are leaving the civilised world behind us to enter upon a career unknown.'

The expedition sailed from Plymouth in the month of April, but it was not until October that the shores of Australia were descried. Collins and his officers chanced to land on a sterile and desolate portion of the coast; and after sundry disappointments, arising from the absence of fresh water, the barrenness of the soil, and other causes, a spot without the Heads—as the rocky barriers at the entrance of Port Phillip are termed—was selected as the site of the intended settlement. A more unfortunate choice could scarcely have been made; it was found impossible to subsist in such a locality; nor were they successful in their endeavours to discover a favourable district. Acting, therefore, on the discretionary powers wherewith he was invested by the government, Colonel Collins

decided on abandoning Port Phillip, and steering across Bass's Strait. He eventually founded the penal colony of Tasmania.

But before this removal occurred, eight of the prisoners absconded. Five of these were subsequently recovered; but the others never returned, and were supposed to have perished of hunger, or to have been slain by the natives.

For thirty-two years, Port Phillip remained unsettled, and, in fact, was supposed to be unfit for the habitation of civilised man. In the interval, however, sundry partial explorations had taken place. Hume and Hovell had penetrated overland to the Geelong country; and the Sydney government had failed in a second attempt at convict colonisation. Sturt had discovered the source and embouchure of the Murray River; M'Killop had ventured to Lake Omeo, and gazed upon the eternal snows of the Australian Alps; and Henty had established a whaling-station at Portland Bay. But the honour of practically demonstrating the capabilities of Port Phillip belongs to John Batman. In May 1835, this gentleman sailed from Launceston, in Tasmania, and landing on the western shores of the bay, at a point named by him Indented Head, he at once observed that the land in that region was excellently adapted for either tillage or pastoral uses. The natives were also very friendly; and having, by the aid of interpreters, been made to comprehend the object of the white man's visit, they cordially welcomed and granted him a large tract of land.

Delighted with the successful result of his enterprise, Batman returned to Tasmania for seeds and implements, leaving six of his men, with three months' supply of provisions, in charge of his newly acquired property. During his temporary absence, a strange event occurred.

The natives were so little alarmed at the presence of the whites as to mix freely with them, and often assisted them by various friendly offices, which were requited in kind. One day, however, a savage of fiercer aspect than usual made his appearance. He was very tall, and of monstrous bulk; his matted hair hung wildly about his shoulders, and his features were nearly hidden by the profuse growth of his beard. A loose 'rug' or wrapper, made of the skins of the kangaroo, was his sole garment; and in his hand he carried a long and formidable spear, constructed of the close-grained wood of the country, and its point and rows of inverted teeth hardened by the action of fire.

As this uncouth being approached the tents, their inmates perceived with astonishment that his skin

was of a tawny hue; whereas all the natives whom they had yet seen were black. This caused them to surmise that he might possibly be of European origin; and as he stood before them, evidently labouring under strong excitement, and apparently striving to speak, yet uttering no sound, one of them offered him bread, at the same time pronouncing its name. The poor fellow mechanically seized the proffered food, and endeavoured to repeat the word. After reiterated efforts, and as many failures, a sudden thought seemed to strike him. His eyes brightened, he cast away his spear, and stretching out his arm, with eager gestures, invited their attention to something marked thereon. On examination, this proved to be two letters, 'W. B.,' rudely pricked out and stained, sailor-fashion. These they sought to decipher. 'W,' said they for William. He smiled and nodded. 'B' for Burges. He shook his head. Brown, Bruce, Ball—every name commencing with the second letter of the alphabet that they could think of, was tried, with the like result; till at length, as by a mighty effort, their strange visitor burst into speech, and exclaimed, with a genuine English accent: 'W. for William, B. for Buckley.'

Then they knew that it was one of their own countrymen who stood in that wretched guise before them.

On Batman's return to Port Phillip, he was informed of this discovery, and being a man of kindly disposition and feeling heart, he at once assumed the protection of the white savage. His first care was to shave and clean his *protégé*—a process which appears to have considerably lessened the duskiness of the latter's complexion. The kangaroo skins were dispensed with, and a more civilised costume substituted; but it was long ere he could walk in shoes without much discomfort. His first shirt—sewn by Miss Batman—was of Brobdignagian proportions, consisting of an incredible quantity of linen; and when he was set on horseback to accompany his protector, it was discovered that the stores of the settlers could not furnish stirrups sufficiently large to accommodate his huge feet.

By slow degrees, the reclaimed man recovered the use of his native language, and was enabled to communicate his history and adventures. It must not be supposed, however, that his reminiscences assumed the form of a connected narrative; on the contrary, they were extracted from him, not without difficulty, at various times. To the last, he was sullen and reserved, usually answering in monosyllables; and not unfrequently he manifested great anger on being questioned of his past life. He is also said to have varied considerably in his account of some particulars; but his habitual taciturnity, and imperfect command of language, probably caused him to be misunderstood by the retailers of his conversation.

His history, divested of the romance wherewith it has sometimes been clothed, is as follows:

William Buckley—for such was indeed his name—was born at Macclesfield, in Cheshire, in 1780. In early life, he followed the occupation of a stone-mason; but his great height—which is stated at six feet six inches—and stalwart proportions attracting the notice of a recruiting sergeant, he was easily induced to exchange the trowel for the musket, and accordingly enlisted in the 4th regiment. He had served but a short time in his new capacity, when he robbed one of his comrades; for which offence—such was then the severity of our laws—he was sentenced to transportation for life. This occurred in 1803, in the twenty-third year of his age; and it thus happened that he became an unwilling member of Colonel Collins's abortive expedition to Port Phillip. When the order for removal to Tasmania was issued, Buckley, and two others, named respectively Pye

and Marmon, feeling doubtful of their ultimate fate, effected their escape from the camp, as previously stated; and the vessels sailing shortly after, nothing more was heard of them.

What became of Pye and Marmon has never been satisfactorily ascertained. Buckley himself always evinced great dislike to being questioned about them, and seemed to regard the inquirer with much suspicion. It appears that the course taken by the fugitives was around the head of the bay; and Mr Wedge, in his report to the Geographical Society of Tasmania, dated 1835, says that Buckley assured him, that in their flight, Pye became exhausted, and was left behind at the Yarra River; and that Marmon quitted him at Indented Head, with the avowed intention of returning to the camp. But there are many different versions of this affair. Sometimes Buckley averred that they were killed by snakes, and at others that they had lost themselves in the bush, and were never seen by him after. But the Australian wilds furnish no indigenous fruits capable of affording sustenance to man; and it is generally believed that hunger, and the difficulty of procuring food, induced a repast at which humanity shudders. Be this as it may, no vestige of their remains has ever been discovered.

After parting from his companions, Buckley appears to have remained alone some time. One day, however, disgusted alike with his solitary life, and the precariousness of his means of subsistence, he wandered on the beach, anxiously endeavouring to deary some vessel, which happily might rescue him from his vast prison. His shoes had long since abandoned his feet, which now therefore left their imprint on the soft sand. As he strolled listlessly along, he picked up a fragment of a spear, and with this he waded amongst the rocks in search of shell-fish, now his principal food. Whilst thus engaged, he was observed by three native women, who, creeping stealthily down to the beach, imagined that they beheld in him their lost chief Murragak, whom Buckley appears to have resembled in size and stature. The illusion was increased by the circumstance of his carrying the broken spear of the deceased warrior; and the colour of his skin excited but little surprise, being readily ascribed to the potent influence of the grave.*

The Delilahs of the forest having, in a manner, captured this ungainly Samson, brought him, nothing loath, to the men of their tribe, who, in fact, had seen his footprints on the sand, and were already in search of him. He was immediately surrounded by a mob of yelling savages, and doubtlessly imagined that he was destined to be carved into collops for the gratification of his epicurean captors; but again his resemblance to the great chief befriended him. They examined his feet and hands—they eagerly scrutinised the spear, of which he had fortunately retained possession; and when they discovered on his side a scar, similar in appearance to one which had marked the body of Murragak, they deemed the evidence of his identity complete. Buckley, meantime, mistook their very animated gestures for so many tokens of their pleasure at his fleshly condition. A long conversation ensued, during which the name of Murragak was incessantly repeated. It ended, very much to his satisfaction, in their feeding, instead of eating him; and he was given to understand, by signs, that thenceforth he was never to quit his savage entertainers.

Accordingly, although treated with great respect,

* The superstition here alluded to is very prevalent amongst the Australian aborigines, who imagine that the whole of the white population are their deceased brethren. For a supposed restored friend, they testify great affection; but it is very unpleasant, and not a little dangerous, to be mistaken for a departed enemy.

he was scrupulously watched by day and night. He was never suffered to fatigue himself with the exertions of the chase, nor to perform that infinitesimal amount of labour to which the natives of Australia unwillingly submit. His ganyah was reared for him, and his larder stocked with unwonted extravagance, by his savage friends. The daintiest morsels of the kangaroo, and the most juicy of opossums, the sweetest portions of the wombat, the whitest grubs of the mimosa, and the largest of gum-balls, were his. His also the largest eggs and the finest fish—the richest berries and the most delicate roots. The rarest pigments were devoted to his use, and the warmest skins were added to his wardrobe.

Thus, from a state of abject misery and utter loneliness, Buckley was suddenly elevated to a species of savage royalty, and held in reverential awe as the restored Murrargark. For some time, the only perceptible fluctuation of public opinion was the occasional outburst of cannibal propensities, when his wild subjects seemed to survey his colossal form with much peculiar admiration.

Buckley's domestic comfort was also duly considered, and a dusky, but buxom young widow was assigned to him, by the general consent of the tribe, as his lubra, or spouse. For a time the pair enjoyed the utmost felicity of which two such strange turtle-doves were capable. But this lasted not long; for, according to Buckley, the honeymoon was scarcely over, when his hut was one night invaded by sundry native gentlemen, who, claiming a prior right, forcibly carried off the bride. Much violence does not appear to have been offered, nor were the husband's feelings greatly lacerated by this stroke of fortune. He acknowledged, indeed, that his lubra went very willingly, and that he did not 'make a fuss about the loss.' But the natives seem to have taken a widely different view of the affair; for, irritated probably at this practical disparagement of their own judgment, at the lady's faithlessness, and the injury inflicted on their white friend, they speared both the frail one and her lovers.

But if Buckley's first companion was insensible to his charms, there were other hearts more tender and more true. A gentle damsel, of the same tribe, of her own accord visited his solitary home, and sought to soothe and please the forsaken stranger. Nor were her efforts unsuccessful. Buckley, at various periods, had many wives, but he always expressed himself in more favourable terms of his second partner than of any other. On the sea-shore, near Point Lonsdale, is a natural cavern, in the limestone rock, which is said to have been the abode of the wild white man and his mate during this portion of his eventful career.

It has been doubted whether Buckley had any children. By those who knew and conversed with him, this point is diversely stated; some declaring positively that he was childless, but others, and the majority of evidence is on this side, speak of sons and daughters. When reclaimed, in 1855, he had with him two lubras, and a boy and girl; but he always spoke of these as adopted children.

Many other particulars were at sundry times extracted from him, and have been worked up, by Mr Morgan of Hobart-town, into a long and interesting narrative. In it are numerous details of native feasts and fights, of huntings and corroborees; but, as might be expected, there is a great paucity of actual events. Occasionally, he seems to have lost a portion of the influence he ordinarily exerted over his black friends. Whether their faith in his involuntary personation of Murrargark sometimes became weak, or was overpowered by hunger, we know not; but he avowed that for some years he constantly expected death. The young men, he said,

were for killing him; but the elders of the tribe always interfered to save his life. He appears to have taken matters very coolly; and if he possessed, he certainly never attempted to exert the magic of civilised intellect, nor sought, by the communication of useful arts, to improve the condition of his savage associates: on the contrary, contented apparently with the gratification of his animal appetites, he willingly sunk to the dead and dreary level of Australian barbarism. Like his untutored friends, he fed on raw or semi-roasted flesh, clothed himself in the skins of beasts, and acquiring the native dialect, ceased even to think in his mother-tongue, until, as we have seen, he had totally forgotten its use. Once or twice, he said, he saw ships enter the bay; but he does not appear to have made the slightest effort to attract the attention of their inmates, nor in any way to extricate himself from the degrading position into which he had fallen, until Batman firmly planted his foot upon the soil.

Such was the poor lost creature whom, after thirty-two years of savage life, the early colonists of Port Phillip restored to civilised society; and, it is proper to add, that his own delight, when he was enabled to comprehend the change, was unbounded. 'Nothing,' says Mr Wedge, 'could exceed the joy he evinced at once more feeling himself a free man, received again within the pale of civilised society.'

However he may have been deficient in other qualities, ingratitude was clearly not one of Buckley's faults. Both Batman and Wedge concur in stating that he exerted himself greatly in maintaining amicable relations between the natives and the colonists. To the former gentleman—his constant friend and patron—he was much attached; and when informed of his death, it is recorded that 'he threw himself on the bed and wept bitterly.'

Buckley's subsequent career is soon told. A free pardon was, at his own urgent desire, procured for him from Colonel Arthur, the governor of Tasmania; and he was appointed native interpreter, with a salary of £50 per annum. In this capacity, his services were in great request; and when Sir Richard Bourke came down from Sydney to survey the new colony, Buckley was selected to accompany him in his tour through the country. But his position soon became uncomfortable. Serious disputes broke out between the settlers and the native population. The latter committed many robberies, and at length speared two of their white neighbours, whose graves, on the Flagstaff Hill, near Melbourne, are still religiously preserved. We have no record of offences on the other side, but doubtless the whites were not blameless. Buckley, who could not forget the kindness of his old friends, refused to interpose between the contending parties, declaring that the hostility of the blacks was solely attributable to the misconduct of the colonists. Fearing, therefore, that he might relapse into barbarism, Batman resolved to send him out of Port Phillip; and accordingly, in 1836, he was induced to embark for Hobart-town, where he resided, during the remainder of his life. His figure and strength obtained for him the post of constable, which he held many years. Subsequently, he was employed as assistant-storekeeper at the Immigrant's Home, and, later still, as gate-keeper of the Female Nursery.

In his sixtieth year, Buckley, again venturing on matrimony, contracted a union with the widow of an immigrant. In 1850, the Tasmanian government bestowed on him the insignificant pension of £12 per annum; and in the following year, Victoria having been separated from New South Wales, and erected into an independent colony, its legislature voted an additional annuity of £40.

Endowed by nature with an iron constitution,

which his wild life no doubt materially assisted to strengthen, Buckley enjoyed vigorous health almost to his latest hour. His death was occasioned by accident. In January 1856, he was thrown from a vehicle, and received such severe injuries in the fall, that in a few days he breathed his last sigh, at the advanced age of seventy-six.

LONG BALL-PRACTICE.

TEN years ago, large guns and small were the simplest things imaginable. A tubular orifice driven not quite through the length of a metallic bar; a very much smaller tube bored at right angles to the aforesaid, near to its closed extremity, thus serving as a touch-hole—and, behold, a gun! The axial bore might be a little tube, it might be a big tube, without disturbing our ideas in the least degree as to what should constitute a gun. Except in reference to that particular sort of gun known as 'the rifle,' the philosophy of firearms, as they were in England some twenty years ago, is soon exhausted. Since that period, extraordinary developments have arisen in the construction of firearms, all of them very beautiful, and some of them very curious. A few special cases have been touched upon by us in these columns already. For example, on the occasion of the Russian war, we presented our readers with rudimentary knowledge of a department of conchology not much studied even in these days of sea-side ramblings and marine aquaria. *Martial conchology* we would be understood to signify, explanatory of the difference between common and shrapnel shells, together with several other matters of the sort. We also said our say anent that very curious specimen of no-tailed war-rocket devised by Mr Hale. Colt's pistols and Minié bullets have also passed under our review; so now, keeping well *au courant* in the projectile art, we purpose acting as master of the ceremonies to certain other candidates for public approbation in the man-killing, wall-splitting, gunpowder-consuming line.

Banishing for a moment all names and designations, let us look at the requirements of the projectile art of war; and, firstly, of small-arms. The simplest classification of these is into pistols, cavalry carbines, and muskets; by which latter term we will understand all infantry firearms, whether rifled or non-rifled. In each of these three, there have been great improvements during late years; to some of which we shall advert.

Firstly, in respect of pistols, the revolver principle has fairly beaten all others out of the field. As to the antiquity of that principle, there may be now seen in the Tower of London a revolver firearm made for the special use of Henry VIII. If that bluff monarch, with tender conscience and delicate sensibilities, had fired the weapon pretty often, it might have fared better with a few of his queens. Our meaning is, that the arm would have inevitably gone off at the wrong end, so roughly is it constructed. Indeed, not all the latest improvements of flint-locks could enable the manufacturer to turn out a perfectly reliable revolver; to the successful construction of which the detonating or percussion principle is absolutely necessary.

Having all the useful phases of revolving firearms well under view, we do not hesitate to say that Colonel Colt was the first person who succeeded in turning out of hand a revolver perfectly efficient and reliable, adapted for all the exigencies of war to which a pistol can be applied. For many years this celebrated weapon maintained a distinguished precedence over all others, notwithstanding that an English firm—Deane and Adams—constructed revolving pistols which admitted of being discharged with greater

rapidity than Colt's. The American pistol requires to be cocked by the thumb, like any ordinary firearm; when cocked, the line of aim is clear, and discharge may be effected by as light a touch at the trigger as the shooter may desire. The English revolver *required*—we speak of the past—no special cocking, the trigger-pull acting that part. Necessarily, a trigger-pull performing this function must be somewhat dead and heavy; so that at very close quarters the English pistol undoubtedly possessed advantages over its American competitor, yet Colt's revolver was better adapted to the taking of steady aim. An officer, whose name at this instant we forget, was surrounded at the battle of Inkermann by six Russians; possessing one of the self-cocking English revolvers, he shot four, and testified to the manufacturers that had there been a necessity for cocking the pistol by thumb in the ordinary way, his life would have been taken. Still the dead trigger-pull incidental to cocking was in some cases a disadvantage. It has been obviated. The British revolver may now be caused to discharge itself by mere trigger-pull as formerly, or it may be cocked by thumb and exploded like any ordinary firearm.

The revolver principle has succeeded well in the construction of pistols, as we have seen. Has it answered in respect of cavalry carbines and infantry muskets? No, it has not; and we think there is but little chance of its thus succeeding. By this we would wish to be understood as expressing our belief that although tolerable weapons of the carbine and musket classes admit of being made by adoption of the revolver principle, still much better weapons of the same classes admit of construction by adopting other types. This for several reasons. Firstly, inasmuch as a cavalry carbine has to be shouldered and discharged with one hand, it should be light; and seeing that inasmuch as one barrel must be necessarily lighter than five or six, though they be only rudimentary barrels, as we find them in revolver pistols, *therefore, ceteris paribus*, a one-barrelled carbine must be best. But a functional objection exists to the adoption of the revolver principle by any kind of firearm larger than a pistol; and we beg the reader's attention to it, inasmuch as the remark applies with still greater force to artillery. *By increasing the calibre of a gun, the strength of its parts relative to gunpowder, decreases in a rapidly increasing ratio.* Wherefore it happens, that, though in pistols the breech-joints necessary to carry out the revolver principle may be made practically tight, there comes a maximum bore at last, with which such tightness is impossible. Developing still the size of our ideal gun, there comes finally a bore beyond the diameter of which, though no joints are involved, the mere cohesive strength of material used forbids the manufacturer to go; for, curiously enough, it is a well-demonstrated fact, that after a given thickness of material, varying according to the cohesive strength of material employed, no mere addition to thickness adds to strength or power of resistance. Slightly anticipating another part of our subject, we may here indicate that the limit of strength for cast iron, fashioned into long pieces of ordnance, capable of projecting with safety solid balls, corresponds with about eight inches diameter. True, cast-iron long-guns are now made of ten, and even eleven inches diameter, but they are only strong enough to be used for projecting shells or hollow shot.

Though the revolver principle seems barely compatible with the necessities of a cavalry carbine, yet in no description of firearm is the want of some efficient breech-loading contrivance more pressing. Even with all the facilities of loading which the conoidal expanding principle has given, as exemplified in the Minié and Enfield rifled muskets, still, the

operation of charging a cavalry carbine by the muzzle, and on horseback, at all, is most inconvenient. Various attempts have been made to obviate this inconvenience; some answering well enough with low charges, others with high charges, in careful hands; but very, very few complying with all the requisitions of common cavalry practice. In the improvement of carbines, no less than of pistols, our American cousins have been foremost. The cavalry carbine of Colonel Greene is a breech-loader. It is charged with an ordinary paper-cartridge, and has the remarkable peculiarity of causing the explosive force of the charge to contribute to the tightness of the joint. We hardly know whether we shall succeed in rendering intelligible the manner by which this is done. Firstly, the piece, though one-barrelled, has two triggers; one being pulled, liberates the barrel, which now admits of being pulled out of a catch, and turned towards the operator's right, in such manner that a paper-cartridge holding powder and ball admits of being slid in; the use of a common cartridge indeed being a great point gained. The cartridge is neither bitten nor broken; but the act of replacing the barrel in its catch forces a sort of pointed perforated steel tooth—something like a snake-fang, though straight—into the very middle of the cartridge, which is thus ready to be fired as soon as a percussive blast rushes through the tubular orifice of the fang. This is accomplished by the very ingenious contrivance known as the Maynard primer, and universally employed now in all American non-revolving military small-arms. If we turn aside from our main object to describe such a collateral thing as the Maynard primer, we shall never have done. The reader will therefore be so good as to excuse our stating more on that head than the general principle subserved. The Maynard primer is a little magazine of some fifty or sixty percussion patches brought successively, by the act of cocking, quite over the nipple, so that the niggling act of capping the piece is obviated. From the Maynard primer let us now go back to the piece itself, and trace out the destiny of the cartridge. Though placed within the barrel, it does not touch the latter, but is surrounded by a sort of tightly sliding, short internal chamber, larger anteriorly than posteriorly, and terminating on the latter aspect by a sharpish edge. The interior of the sliding-chamber is, in point of fact, a truncated cone; its exterior being cylindrical, and tightly fitting the barrel, save where the posterior face of the chamber is ground away to a bluntish edge, the latter bearing upon a flat plate of iron. Now, owing to this configuration, it follows that when the powder within the cartridge explodes, a backward pressure will be exerted upon the short sliding truncated conoidal chamber, the posterior cutting edge of which will be thrust against the flat iron bearing. We have been thus particular in describing the construction of Colonel Greene's carbine, because of its approval in British military circles, and its partial adoption by the British cavalry.

Sharpe's is another American invention in the way of breech-loading carbines. In charging this firearm, an ordinary paper-cartridge is also used, of which the posterior aspect is ripped off in the act of closing the breech-opening. The objectors to Sharpe's American rifle affirm that it nips off an uncertain quantity.

And now, before passing on to the consideration of muskets, some few matters must be taken for granted as lying within the sphere of the reader's cognizance, otherwise we shall never get to the end of our tale. Firstly, we will assume that every reader—except a lady-reader perhaps—is aware of the fact that gun-barrels are either rifled or non-rifled. Secondly, that except for fowling, no person one shade more civilised than a Dahomey grenadier will ever use a non-rifled,

alias small-bored, small-arm again. Thirdly, that all civilised rifle-balls are, and have been these few years past, more or less like *sugar-loaves* in form.

Before passing to *fourthly*, pause we a while to contemplate our Hibernicism. To speak of a ball shaped like a sugar-loaf, is indeed startling; but surely *bullet* is no better. One may say *projectile*, but it is abominably pedantic, and *conoid* is hardly to be recommended. Cousin Jonathan's inventive genius is not only strong in gun-making, but in the coining of new words out of the old tongue. He calls the sugar-loaf shaped balls to which we have been adverting, *pickets*. A very good word it is too. We shall adopt it, and commend it to the favourable notice of all dictionary compilers. *Fourthly*, we take it for granted that everybody knows how a rifle-picket spins through the air, point foremost; whereas a ball proper, fired from an ordinary non-rifled gun, simply rolls whilst flying through the air, as a marble might roll upon the ground. Fifthly and lastly, as it seems, we will assume every reader to be aware that whereas the bullet of a common gun fits the bore loosely, a rifle-picket, ball, or other projectile must—at least at the moment of discharge—fit its barrel with all possible accuracy and tightness; a rifle bore is, in point of fact, a hollow screw, and the projectile within it is a solid one.

Two distinct principles of facilitating rifle-practice suggest themselves—that is, breech-loading, and expanding pickets. Of these, the Prussians have adopted a variety of the first in their celebrated needle-gun. Ourselves, the French, and Austrians, have adopted varieties of the second, one or the other of which is now perhaps in course of adoption by every civilised nation. The self-expanding picket system consists in fashioning the picket in such a manner that dropping loosely into the gun at the time of charging, it becomes expanded and tightly fitting by the force of gunpowder discharge, either directly applied, as in Lancaster's celebrated oval-bore sporting rifle, or indirectly, as in the Minié rifle and the Enfield weapon now adopted by our own service. Into the base of the Minié picket an iron thimble is inserted, which, receiving the blow of explosive discharge, is driven far up into the middle of the leaden picket, which it consequently expands; sometimes too completely indeed, for instances are not unfrequent of the thimble shooting quite through the picket, which latter remains as a leaden tube, lining the gun-barrel. Liability to the accident here adverted to is a weak point of the celebrated Minié weapon, which has mainly led to the substitution of the Enfield rifle in our military service. In this latter weapon, a hard wooden plug is substituted for the iron thimble.

The first requisition for a military rifle is, in the opinion of non-military people, extreme length of range; but there are qualities in subservience of which length of range becomes a secondary consideration, and must, if necessary, be abandoned. A good military small-arm must be able to shoot often without fouling. This is essential; otherwise the arm, however long its range, is a failure. Now, the conditions for imparting a maximum rifle-range are perfectly well known; they are, *maximum length of picket, involving minimum of calibre*. In sporting rifles, these conditions are carried out to the extent of diminishing the calibre to half an inch bore. In the construction of military rifles, so small a diameter is not thought expedient. To shew how little advantageous an extremely long range of rifle-shooting is regarded by military judges, the Enfield rifle, which carries more than 1000 yards with accuracy, is only sighted up to 700 yards. There is something *ad captandum* in the idea of an extremely long range, which may beget wrong impressions. The public have heard a

good deal about rifles which will shoot farther than the Enfield. True; but the Enfield rifle, for reasons mentioned, was limited as to the dimensions of its bore. The public, too, have been startled by the vast penetration of a certain rifle-picket; but the inventor omitted to state the all-important fact, that the projectile was made of hard metal, not lead, and therefore could never have been successfully employed in military service.

The greatest popular misapprehension exists as to rifled ordnance. To adapt the rifle system to ordnance at all is a problem of great difficulty; but for the sake of argument, we choose to regard it done. Well, once impart the rifle-spinning motion to an artillery projectile, instead of the ordinary rolling motion, and it is incapacitated for all purposes save one—to go straight at its object in one direct unbroken flight. What more can be reasonably expected of cannon? the reader will possibly ask. Much, very much. If a cannon-shot had the invariable task assigned it of going straight at the object, a rifled piece of ordnance would always assuredly be best. But cannon are expected to be versatile things; and the versatility of their adaptations adds much to their deadliness. A non-rifled projectile admits of being gently bowled out of a gun, when it hops along very much like a cricket-ball. This is called ricochet practice, and is very destructive. Taken all in all, it is worth more against men, and ships, and even fortifications, than direct firing. Once let a rifle projectile touch ground or water, and its original line of flight is gone: whirling on one side, it is almost useless. Again, the very deadliest applications of cannon to man-killing are the projection of grape and canister shot, and shrapnell shells—all repugnant to the rifle system.

If all gun-projectiles were round, made solid of similar material, and filled with proportionate charges, the largest balls would range furthest. Therefore—excluding the rifle principle—the range of ordnance, *ceteris paribus*, would be directly proportionate to their calibre. But *ceteris* are *non paribus*. In proportion as the calibre of a gun increases, the largest possible charge of gunpowder decreases, and also the weight of projectile; so that a cast-iron gun of more than 8-inch bore can hardly be used with safety for the projection of solid shot. Nevertheless, there is a craving for larger cannon strong enough to project solid shot; and, strangely enough, the proposition by which this is sought to be accomplished is no less than the one of returning to the hoop-and-stave system of ordnance manufacture, or, at any rate, a modification of it, as employed in the earlier days of cannon manufacture. In this direction the Americans, under the guidance of Treadwell, are working; so is Mallet in our own country. The latter gentleman has come prominently before the public of late in connection with the built-up 36-inch iron mortar, which, although no very long range has yet been got out of it, has succeeded well enough to establish the soundness of the principle. We stood on the 18th of December last not more than 100 yards distant from the spot where one of the monster shells of this mortar fell, and plunged so deeply into stiff clay-land that the longest shell-probes failed to reach it. The depth to which each of these shells probably sinks after a flight of 16,000 feet may be over twenty-five feet. Of course, on an experimental occasion like that adverted to, the shells were not charged; but the effect of their mere dead weight and impetus is something marvellous. Hissing through the air, they fall each with a dull loud explosion almost louder than the discharge of the mortar itself as heard by one standing close to it. Huge lumps of clay are now shot aloft, and stones fly about in all directions. Presently, when these

fragments have cleared away, and the observer looks upon the spot of impact, a veritable crater is seen, black and yawning. For a depth of some eight feet, a huge ragged pit is seen to be delved out, extending from the lower part of which is a hole proportionate to the size of the shell. What this shell, if charged, would accomplish, may be left to the imagination. One can form a good notion of what 480 pounds of powder would do if ignited some twenty feet or more below the earth's surface. As regards the construction of Mr Mallet's mortar, it resembles that of ancient stave-cannon, with the following difference: The staves of ancient cannon were all in one circular row, as also the hoops which surrounded them; whereas the staves and hoops respectively of Mr Mallet's compound mortar are in more rows than one; and as for the hoops, each concentric layer is slipped *hot* over the one underneath, whereby, on cooling, contractile force is exerted, and made to count for strength in the general structure of the gun.

PROCEEDINGS IN BREAKNECKSHIRE.

I AM very much afraid that the Mudbury Coursing Meeting has ruined that eminent metropolitan man of business, our friend Mr Robert Jones.* He is dog-bitten, and, what is worse, horse-bitten, and there is no little apprehension entertained by his country friends of his going turf-mad. Nothing I could urge could prevent him from driving his trusty quadruped Seaman over to Rasperton, fourteen miles away, to see the steeple-chases in the neighbourhood of that town. I could not accompany him myself, having other agricultural business to attend to; but he did me the favour to say, that he could get on very well without me, if I would only lend him my horse and gig.

I should like Sloggard, his junior partner in the oil-and-colour line, to have seen Mr Jones as he left my door on Friday last, equipped for this expedition. I am much surprised if he would not straightway have scraped together all he could, and bought the head of the firm out of the business while it was still a flourishing one. A broad-brimmed but far from Quakerish-looking hat; a green cut-away, blossoming into a red scarf, with a silver horse's foot by way of petal; a piece of a buff-waistcoat; a white pair of what you could scarcely call continuations, they as immediately terminated in a couple of enormous riding-boots—the whole viewed through the dim obscure of the smoke of a cigar—made up the sum of what is known in the City as Jones and Company. Perched upon three driving cushions, with his elbows squared, and a long whip flying by his side, he might have sat for a type of the gentlemen who figure most brilliantly in the Insolvent Court. There was a smack of overtrading and reckless expenditure in the very tones in which he observed, 'Let her go!' to the groom at Seaman's head, as though my favourite brown had been a female. He came back, indeed, from the scene of dissipation in a far different—But I am anticipating; let him tell his steeple-chase experiences after his own fashion.

I had no difficulty whatever—thanks to your accurate directions and Seaman's exemplary conduct—in arriving at Rasperton; and I put him up, according to your advice, at 'The Weasel Asleep.' I got there at twelve o'clock—only thirty minutes before the first race was advertised to be run, so that I thought I would invest a shilling in a conveyance to take me to the course. The flyman, however, to whom I applied charging the modest sum of a

* See Journal, No. 212.

sovereign for that accommodation, I joined the mighty stream of pedestrians who set towards the scene of action, ceaselessly, like a river to the sea—turbid waves of the lower classes of the sporting fraternity—ex-grooms and hangers-on to stable-yards, fringed with a gayer foam of gipsies, and recruits, and card-sellers, in rags of red-coats and shreds of hunting-caps. To judge by the number of us with a straw in our mouths, we must have carried with us at least a couple of ricks in that manner; but what symbolic meaning may attach to the practice, I do not know. Moreover, it appeared that there was a mysterious something connected with the sports of the day, which made us converse sententially or in oracular whispers, as though we had a weight upon our minds not lightly to be communicated. We had also, for the most part, *cupidon* or bow-legs; and when we stood still, we straddled as much as possible, consistent with our putting both our hands in our pockets, as though we were afraid of having them picked; for, although we did not look as if we had so much to lose, we kept up a running-fire of bets of from half-a-crown to half-a-sovereign.

As we neared the racing-ground, the crowd filled all the turnpike-road, and particularly those parts of it which the horses would have to cross in their career; a ditch and hedge on one side, with a steep bank to be surmounted, and on the other side 'a drop,' as my sporting friends euphoniously termed it, but which I should call a precipice. In the field where the grand stand was built, were horseless carriages of all sorts standing outside the ropes, and filled with beauty and fashion, as upon ordinary race-courses; but there were no Bounding Brothers of Byzantium, or portable theatres, or 'Now you have my grandmother's night-cap, and here you have Nicolas the hex-Hemperor of all the Roosias, and there you have the Great Exhibition of eighteen hundred and fifty-one'—all made out of a paper fan. The aspect of the place was gay, but business-like; we were all come there in earnest, either to do or to be done. The view from the grand stand was certainly very brilliant, and the shouting and confusion of sounds that came up thither mellowed by distance, was as music to written words. The course lay mapped out before us in a circle of about two miles and a half, by means of white and yellow flags, and included more than a dozen fences. Of these there was but one artificial fence immediately opposite, consisting of hurdles heightened by furze. There being still considerable time to spare before the races began—one of the peculiarities of proceedings in Breakneckshire being their postponement for at least two hours after the advertised hour of starting—a device, I believe, to benefit their principal subscribers, the innkeepers—I spent that period in making a tour of the course. The first jump after the hurdles was into the road and out of it; next came some very heavy water-meadows, with a broad brook or two with bad taking-off; a bank of stony earth, with a hedge at the top of it; a wall; then another part of the road, with the obstacles, of course, in reverse order, 'the drop' being upon the contrary side; more water-meadows, with ditches; and last of all, a broadish leap, with stunted bushes growing upon the further bank—the worst place of the lot, perhaps—after which was a flat run to the front of the stand. Of my own free-will, I would not have ridden at one of these impediments for fifty pounds; I might have been induced to attempt the whole course, perhaps, if I had been blindfolded, and securely fastened on to the saddle—and not otherwise—for a thousand pounds; but my son would most probably have enjoyed the money.

The bell now rang for saddling: out of thirty horses entered for the first race, twelve only are going to start, whose numbers, as printed on the

cards, are published conspicuously upon a black board erected for that purpose. The sun shines upon their glossy coats, as upon a mirror: scarlet, and white, and orange, and blue and yellow, with variegated scarfa, and combinations of all these colours, are the riders—a goodly show indeed. One of them, the scarlet, has but one arm to guide his fiery steed over that perilous course! Once, if you please, gentlemen, over these hurdles before you start, that the noble sportsmen in the stand may back you or the reverse, according to their judgments. Beautifully ridden, scarlet; if you had been Briareus, instead of single-handed, as you are, you could not have cleared it cleaner! Ah, purple, balking at your first jump; see that you play no such tricks as these in the real race, or you will get the spur indeed! Clumsy yellow, to knock the hurdle down! Nefarious green, to prefer the gap thus offered to him to the fence! Good, orange! agile violet! Now back again, to where the neat and well-appointed clerk of the course is beckoning with his hat; there is your starting-point. 'Fall into line, gentlemen; there is room enough for all.' The murmur of the multitude ceases; the venders of 'Cigar and a light,' of 'Pine-apple toffy,' of 'Three heaves at the Chiney ornaments for a penny,' are for the moment silent; the gipsy has broken off in her splendid promises of an heiress and four in hand to the young man sitting in the gig, and stands up on the wheel herself to watch the start. Everything is hushed, except those hoarse cracked voices in the ring, unlovely tones which bespeak the character of their proprietors: 'Three to one that nobody names the winner; five to one against Melpomene' (meaning Melpomene).

The flag is dropped; the twelve are off upon their rapid but hazardous journey; they near the hurdles; 'You may cover them with a handkerchief,' exclaims my right-hand neighbour—say a carpet, and it really seems as if you may—all together, so closely, that we wonder they do not hustle one another; they rise at the fence, and clear it like a flying rainbow. Beautiful sight, indeed! They slacken their speed because they are coming to the leap into the road. Well cleared, agile violet, and well cleared again into the meadows. The green is down! the scarlet is over him! the rest are safe! See how the dense crowd closes in upon the struggling men and horses! My numerous sporting friends who could not command five shillings for the stand, took there their post, being well aware that those two fences would afford them some gratification. The one-armed man is in the saddle again and after the others; the green and his unfortunate animal disappear from the public eye altogether.

Proceedings in Breakneckshire are becoming unpopular as it is, and the spectacle of shooting a horse had better be, in these mawkish days, a private one. As for the rider, he has only a shattered rib or two, and is accustomed enough to be carried home on shutters and other hard conveyances; he considers himself in luck to-day, for he has met with a straw hurdle. I am forgetting, in these miserable considerations, the continuance of the race itself.

The next brook has been cleared by all; nay, there are but ten where there should be eleven competitors; but still there are plenty to look at. Clumsy yellow is leading, and has knocked down the wall for the rest of them. If some inhuman tyrant should have forced me, under pain of death, to have ridden this steeple-chase, I would have stuck behind clumsy yellow like a leech. Another brook, and the field is reduced to seven; and now comes that terrible road again. Agile violet leaping well on to it over the bank and hedge, slips on the muddy path, slides backward as black is about to spring; two horses down, three horses, four horses down! White, however, and orange, are both over, and clumsy yellow

has got upon the right side also, plastered from ears to tail with specimens of every soil in Breakneckshire. Slowly over the heavy meadow-lands, slowly over the brooks, and well in hand and all together at the last fence of all; there, too, has arrived one-armed scarlet, whom a fall rather refreshes than otherwise; and at no great distance comes the agile violet, making up not quite half of the dozen who started. Orange, as well he may, swerves from the stunted bushes; scarlet, with only one arm to hinder it, must needs swerve also, and refuses. 'White,' says my right-hand neighbour, 'is bound to be in if he don't ride harder at it than that;' and he redeems his bond by going in accordingly. Only clumsy yellow of the four gets over it, with the exception of his hind-legs, which, after a struggle, he drags out and connects them with the others in the usual way, and so would have come in an easy winner; but cantering home too carelessly, clumsy yellow is overtaken, headed, and after a sharp struggle, defeated at the post by agile violet. Let us make one of the cheering crowd which accompanies the fortunate moustached rider to the weighing-machine: eleven stone, with saddle and bridle and spurs, as he was before the race, quite regular, and as he should be. But see, what have become of his magnificent moustaches? They are off, and in his pocket; and now that he has changed his clothes, you would never recognise agile violet in the quiet-looking young spectator in black. We are respectable and domestic young men in private life, and do not care to be known as gentlemen-riders at a steeple-chase, that is all. Nothing, not even a pair of moustaches, is what it pretends to be in these proceedings in Breakneckshire. For instance, are there refreshments under the grand stand? Certainly. Anything else? Oh, dear no; all gambling is contrary to the law. Only a smiling, smooth-shaven gentleman just lifts a crimson curtain as we enter into the luncheon-tent, and 'Roulette, gentlemen?' says he, as innocently as though he were requesting us to partake of ginger-beer. Within the ring, the betting has now commenced in earnest, for the great race of the day, the open steeple-chase, takes place immediately, and the horses are mostly well-known favourites of the sporting public.

'I'll bet against Hyacinth,' cries a disbeliever in that noble animal, running the three first words into one, so rapidly are they delivered; but accenting the name of the mare with great distinctness. 'I'll bet against Bluebonnet; I'll back Brimstone against the Field.' What anxiety in those roving eyes—what cautiousness in those unsmiling lips! To judge, indeed, from this portion of the tribe of Ishmael here assembled, whose hand is against every man's, and every man's hand against them, this trade of betting-book-making must be, I fancy, very far from a pleasant one.

Certainly the professional jocks have the advantage of the amateurs in point of appearance; a nobleman may, and often does divest himself of every vestige of his class, in his attempts to emulate his groom; but, after all, the groom looks his own character better than he who would play it. Never did I see a finer set of party-coloured centaurs than those who started for the open Rasperton. 'Neat, sir; devilish neat, sir,' acquiesced my right-hand neighbour, as I made this observation; and he looked down upon the half-sovereign which formed the head of his scarf-pin, as much as to add that that was devilish neat also, and rather a happy fancy. After seeing the whole array fly, bird of Paradise-like, over the hurdles, I hurried away with this gentleman to a certain position by one of the broadest of the brooks, where 'we were safe,' he said, 'to see a purl or two; and if we had luck, it might be half-a-dozen.' Presently there came a rushing noise and a shaking of the heavy morass

about us; then one, two, three apparitions of flying men and steeds; and fourthly, a thud and plunge in the water, that wetted us through, even where we stood. The jock, a mere lad, was upon the bank in an instant; but the beautiful animal which he had bestridden lay in the brook without the power to extricate itself. A crowd closed round it, so that we saw no more; but I heard the shrill, small voice say: 'Well, I'm sorry for it; but get the saddle and bridle off at once, will ye, for I have to ride Saladin for the next race.'

As for his late steed, it was all over with him then and there. 'Broke a vessel,' answered a stable-boy carelessly, of whom we inquired what had happened.

'A blood-vessel, I suppose he means?' said I.

'He means you to think so,' replied my astute companion. 'People begins to say them steeple-chase jumps is too much for a horse's stride, as, indeed, they often are; so those that likes the sport to go on, gives out that they break a vessel, when in reality they break their backs.'

Besides being wet through, and therefore desirous of getting home, this piece of information disinclined me to witness any more steeple-chasing; so I hurried away as fast as I could to Rasperton.

When I got to the Weasel Asleep, it was already dusk, and I had to pick trusty Seaman out from about a hundred other animals; by that uncertain light, all horses not absolutely white are brown, and it seemed to me as if I had driven a whole drove of Seamen into Rasperton. Even in broad noonday, I have always a difficulty in recognising a horse, unless its colour happens to be particularly marked, such as a pie-bald; and therefore it is not to be wondered at that I mistook Lord Scattertin's tandem leader, which would have kicked the old gig to atoms in five minutes, and then Farmer Whityer's colt, which would not have got me home till daybreak, for my borrowed quadruped. Each of these misfortunes, however, was prevented by the hostler, who, upon bringing out the real Simon Pure, seemed to look at me a little askance, as at one who had made a couple of attempts at felony.

'You're sure you've got him right now, sir?' inquired he.

'Yes,' said I, making a little inventory of his principal features: 'short tail, thin neck, bit of gray on his mane. All right this time. Thank you, my man.'

There was a slight fog prevailing, but the moon was large and bright enough to make my road perfectly visible; moreover, I remembered it with great exactness, and was therefore exceedingly astonished when the horse refused to take a turning to the left hand, about three miles from Rasperton. I conquered him, indeed, but not till after a struggle; and instead of the slapping pace at which he had come hitherto of his own accord, he crawled along without even heeding my frequent applications of the whip. Gig after gig, four-wheel after four-wheel passed me, and when I got to Blewourn, a village about half-way home, there was a great array of vehicles in front of the public-house—their proprietors were of course drinking within—and as the fog was by this time getting down my throat pretty thickly, I thought I would take a little something stronger and warmer to mix with it. There was a jovial company of yeomen in the bar-parlour, and I happened to enter just as one of them was concluding an amusing story.

'So the major is going this way with one pistol, and his brother the other with the fellow to 't. Neither of them are the sort of folks to lose a horse without paying out the chap as took it. His favourite trotter, too, with the white nose.'

'How came the man at the Weasel Asleep to let

the horse go?' inquired one. 'Why, that's a very old trick.'

'Ay, old enough,' resumed the narrator; 'but the scoundrel acted, it seems, so natural-like—pretended so innocently to be in search of a horse of his own, that poor Jem was clean taken in. Howsoever, it will be the worse for master Clever if the major do come up wi' him; he is taking the Downs road, I hear, in a proper passion.'

I swallowed my brandy-and-water at a gulp, and ran to the gig. Good heavens! the horse had a white nose; it did not look in the least like Seaman! No wonder it had not liked to turn to the left.

'I see you have the major's nag, sir,' observed the helper gaily. (How frightfully recognisable some horses are! However, it was clear this man could not as yet have heard of the robbery, and if I could only hinder him from going into the inn, all might yet be well.)

'Yes,' said I coolly; 'he's lent it to me. Look here, my good fellow: I have left a pocket-book at the inn, a mile and a half down the road; here is a sovereign for you if you will start at once and ask for it while I wait here.'

No sooner had the hostler's hobnails ceased to beat pit-a-pat upon the frosty road, than I was in the driving-seat, and going at some fifteen miles an hour towards home. Three miles beyond Blewboorn, I came upon an empty cart-house, and there I took out the horse, and put up the gig. I rode the animal for a mile further along the highway, and then fastened him to a tree by the roadside, where he could be easily seen. I did not wish them to think that you, who had so kindly lent me Seaman and the gig, were the thief, you know. Then I left the turnpike-road, and ran a little steeple-chase, all by myself, across the fields, because of the major, to your door.

And that was how Mr Robert Jones came home from the races upon foot, and why I had to send next day for my horse and gig.

NORTHERN SUPERSTITIONS.

In Sweden and Norway, and probably too in Denmark, there are some curious superstitions which the civilisation and enlightenment of the present century have not yet eradicated from the beliefs and memories of the peasantry. They are nearly all of a harmless, somewhat poetical character, though many of them may be traced back to pagan times, and most of the rest to a period when paganism was beginning to give way before the force of Christianity. There is no telling strictly how old they are, nor how they came originally to be believed. No doubt the rugged and massive scenery of the Scandinavian country had something to do with their creation; desolate rocks and mountains, precipices and torrents, lonely lakes and interminable forests, being naturally suggestive of invisible and mysterious powers, and tending to impress beholders with a sense of awe and wonder. Be this as it may, the northern mind, familiar through long ages with awe-inspiring objects and phenomena, has shaped the feeling of dread and mystery so engendered into sprites, fairies, elves, and mountain-monsters, spirits of fells and cataracts, demons of storms and hurricanes, and the wandering ghosts of men and women too sinful to be admitted into heaven. There are other appearances, of a partly human, and partly monstrous nature, which seem to represent certain spiritual and moral contrasts, and reflect the popular conceptions of the supernatural consequences

of good and evil actions. Our information on these matters is not very extensive, but we have gathered lately, from reading Mr Brace's book on *The Norse Folk*, some few singular particulars which will probably be entertaining to the most of our readers.*

One of the most fearful phantoms to a peasant benighted on a lonely mountain road, is the *Aasgaardreia*, or the 'Wild Riders,' who, should a storm be going on, are apt to gallop by with a horrible glee, enough to terrify all hearts but the stoutest. These are the spirits of drunkards, and ale-house fighters and perjurers, who, having been considered hardly bad enough for the depths below purgatory, are compelled to ride over the world till doomsday. They are mounted on coal-black steeds, with eyes of fire, and red-hot iron bridles; and the clanking and rush they make as they sweep over lake and mountain, may be heard at the distance of many miles. They appear to be more commonly heard than seen. They ride most at Christmas time, and especially like to frequent scenes of drunken fightings and carousals, or places where murder is being planned or perpetrated. If they drop a saddle on the roof of a house, the inmates may expect death. Whosoever meets them, should throw himself flat on his face, till the clanking, cursing crew have passed by, in which case he will probably not be hurt. This is said to be one of the oldest beliefs in Norway, dating before the introduction of Christianity. One may suppose it to have originated in some one's taking fright during a tempest.

The story of 'Gertrud's Bird' is a curious superstitious legend, which travellers in Norway are apt to inquire about from frequently hearing it alluded to. Thorpe, a writer quoted by Mr Brace, gives it as it passes current among the peasants. 'In Norway,' says he, 'the red-crested, black woodpecker is known under the name of Gertrud's Bird. It came to be so called from the following extraordinary circumstance: When our Lord, accompanied by St Peter, was wandering on earth, they came to a woman who was occupied in baking; her name was Gertrud, and on her head she wore a red hood. Weary and hungry from their long journeying, our Lord begged a cake. She took a little dough, and set it on to bake, and it grew so large that it filled the whole pan. Thinking it too much for alms, she took a smaller quantity of dough, and again began to bake, but this cake also swelled up to the same size as the first; she then took still less dough, and when the cake had become as large as the preceding ones, Gertrud said: "You must go without alms, for all my bakings are too large for you!" Then was our Lord wroth, and said: "Because thou gavest me nothing, thou shalt, for punishment, become a little bird, shalt seek thy dry food between the wood and the bark, and drink only when it rains." Hardly were these words spoken, when the woman was transformed into the Gertrud bird, that flew away through the kitchen chimney; and at this day she is seen with a red hood and black body, because she was blackened by the soot. She constantly pecks the bark of trees for sustenance, and whistles against rain; for she always thirsts, and hopes to drink.'

This is strange enough as a piece of natural history; but it seems to shadow forth a certain moral meaning which is tolerably obvious. The poorest understanding may gather from it that one ought to avoid greed; that in bestowing charity, it is not proper to be stingy, but what is given should be given with a free and ready hand. A significant moral meaning seems also to be figured in the anomalous creature called the *Huldra*, in whose material existence there is a very widely spread

* *The Norse Folk; or a Visit to the Homes of Norway and Sweden.* By Charles Loring Brace. London: Bentley.

belief. This creature looks like a beautiful woman, but is disfigured by a cow's tail and udder. Being in the habit of attending country-weddings, it sometimes happens during the dancing that her tail betrays her; and very much offended she is if she finds it noticed. Polite people accordingly avert their eyes as much as possible, but take care not to remain long in her company. She is pictured as a sad and pensive being, with a face of wondrous loveliness; and her song, which is often heard in lonely places among the hills, has a tone of melancholy which excites sympathy and pity. The belief respecting her is very ancient, and seems to personify the moral disfigurement which arises from the inseparable union of the animal nature with the higher spiritual qualities when the propensities have been predominantly developed. The mixture of loathsomeness with beauty is thought to proceed from, and be a fitting punishment of sin.

The notion of a supernatural influence affecting a person's fortune, and being the cause of his success or non-success in life, appears to be very prevalent among the northern people. Two peasants, let it be supposed, start in life with equal blessings; each has his rich grain-fields, his patch of wood, his red house, his horses, and his cattle. One thrives from the beginning, and always goes on thriving; his stacks are fuller every day, his crops better, his live-stock healthier, his house constantly protected from storms and the effects of winter. With the other, it is just the contrary. The roof of his house leaks, his barns decay, the wheat mildews, the hay rots, the land grows every season poorer. What is the reason of this difference? Manifestly, the first has his *Tomte*, or little attendant spirit. The last has offended this friendly guardian. The *Tomte*, as every peasant knows, is the spirit of some poor heathen slave, who must work out his salvation by kindly services to human beings before the day of judgment. He is a repulsive, deformed little fellow, hardly larger than a baby, with a shrivelled, shrewish old face, and is fantastically dressed in a red cap, gray jacket, and wooden shoes. The unlucky peasant had seen him at the usual time of his appearance, the broad moonday, dragging wearily along an oat-straw to the stack, or one ear of wheat to the barn, and scorned him, and railed at him, saying he might as well bring nothing as such trifles. Then the *Tomte*, feeling hurt at the treatment, has gone over sadly to the other, who now becomes rich, while the first sinks into poverty. If the *Tomte* brings only an acorn to the barn, he must not be despised. A proverb says: 'The woodman holds the axe, but the *Tomte* fells the tree.' One sees that the virtue of thrift, the duty of being careful of small things, is here allegorically inculcated. Let every man, and no less every woman, take heed to cultivate the favour of the *Tomte*.

The superstition about the *Puks* is more commonplace, but may be noticed in passing. He is a kitchen elf, who is apt to leave offensive traces of his presence about the milk-vessels. Certain old women, it is said, are accustomed to sell themselves to the devil, in order to get possession of these elves, as then they will have as much milk and cream as they desire. If any one wishes to discover these old women, the litter left by the *Puke* must be collected and burnt with bits of wood from nine different trees, at a spot where three roads meet, and then the old ladies will appear. The *Puke*, if traced to his hole, might perhaps be found to be a mouse; but one does not see how the possession of such a sprite could tend to increase the products of the dairy. Does the fable point satirically to some ancient practice of adulteration among milk-dealers, presumably now obsolete—to some 'cow with an iron tail,' for instance, whose 'profits,' by judicious mixture with the produce of the more authentic cattle, may be supposed to have occasioned the aug-

mentation? One troweth not. Such a theory would account for the increase of the milk, but how about the cream? There needs another theory to account for that; and so we must leave the *Puke* in his original state of mystery.

Many of the Swedish superstitions have a specially characteristic tone—a more sober and religious element than the superstitions of other European peasantry. This is particularly true of those which appear to have sprung out of the struggle between heathenism and Christianity. The mysterious spirits of the streams and mountains are not merely fairies—creations of pleasant fancy; they are the unfortunates who did not enjoy, in their mortal lives, the light of Christianity, and are now awaiting the Redemption. They are often mournful, almost despairing creatures; and the passing traveller may wound them bitterly by hinting reckless opinions respecting their condemnation. A plaintive melody is sometimes heard about the shores of lakes, which is attributed to the *Necken*. This being is described in different forms; sometimes as a young man with bestial extremities, representing the power of animal passion, which has brought him to this deformity; sometimes as a forlorn old man; but more often as a sad and solitary youth playing a harp upon the water. The best offering that can be made him is a black lamb, accompanied by hopeful expressions with regard to his salvation; the matter about which he is understood to be most concerned. To tell him that he is cut off from all chances in this direction, is the way to overwhelm him with sorrowful consternation. Two boys are reported to have once said to one of them: 'What dost thou profit by sitting here and playing? Thou wilt never gain eternal happiness;' an unfeeling taunt, which threw him into a passion of weeping. Among the stories related of the *Neck*, Thorpe quotes a beautiful one as follows: 'A priest, riding one evening over a bridge, heard the most delightful tones of a stringed instrument, and on looking round, saw a young man, naked to the waist, sitting on the surface of the water, with a red cap and yellow locks. He saw that it was the *Neck*, and in his somewhat intemperate zeal addressed him thus: "Why dost thou so joyously strike thy harp? Sooner shall this dried carcass that I hold in my hand grow green and flower, than thou shalt obtain salvation." Thereupon the unhappy musician cast down his harp, and sat bitterly weeping on the water. The priest then turned his horse, and continued his course. But lo! before he had ridden far, he observed that green shoots and leaves, mingled with most beautiful flowers, had sprung from his old staff. This seemed to him a sign from Heaven, directing him to preach the consoling doctrine of redemption after another fashion. He therefore hastened back to the mourning *Neck*, shewed him the green flowery staff, and said: "Behold how ray old staff is grown green and flowery, like a young branch in a rose-garden; so likewise may hope bloom in the hearts of all created beings, for their Redeemer liveth!" Comforted by these words, the *Neck* again took up his harp, the joyous tones of which resounded along the shore the whole night long.' A pretty story, surely, and one suggestive of charitable sympathies and hopeful considerations touching the fate of the fallen and the lost.

There are some curious legends connected with particular localities and striking natural objects, which obtain extensive credence, not only among the northern peasantry, but even to some extent among the more refined and educated classes. At a certain old castle in the southern parts of Sweden, Mr Bruce was shewn an antique drinking-horn and a little bone or ivory whistle, which are reported to have come into possession of the family through a very remarkable circumstance. The legend runs, that there was once

a terrible giant who lived in a mountain at some distance from that neighbourhood, and who took great offence at the erection of a church by some pious Christians about fifty miles off near the sea. Though so far off, it seems the giant could not help hearing the singing of the nuns; and it grieved him. Every morning and evening his peace of mind was disturbed by the holy chantings, until at length he grew very angry, and took up a great stone, as large as a considerable house, and threw it with all his might at the pious edifice. The stone, however, broke in two without reaching it, and one piece fell not far from the aforesaid castle. It lies there in the shape of a large boulder near the village. For a long time, no one observed anything wonderful about this stone, and it was not suspected that the wicked little mountain folk, called the *Trolls*, came there; but in the course of ages, stories got abroad that these fantastic little elves were in the habit of raising the stone on golden pillars, and dancing under it. A grand old lady lived at the castle then, and when she heard of this, she became possessed with a great desire to know something of the habits of the fairies; so she promised gold and jewels to any one of her huntsmen who should visit this giant's stone when the *Trolls* were there. The *Trolls*, you should be informed, always dance on Christmas-morning, between cock-crowing and the break of day. At first, no one ventured to go, but finally a brave young huntsman volunteered, and on the Christmas-eve rode forth to the stone. 'When he came near by, he heard the noise of music and dancing, and he saw the great rock raised up on golden pillars, and bright lights underneath. And there was a host of beautiful little fairies, dancing, and singing, and drinking, as if mad; they wound about among each other, and flew and whirled like the leaves in a whirlwind; and there was one of them who was the most beautiful creature ever seen. She had a diamond crown, and a little whistle in her hand: it was the queen of the elves.' Seeing the bold huntsman, she ran towards him and welcomed him; and he was so charmed with her, that he hardly knew what he was doing. Telling her servants to offer him drink, they brought him a hornful of some not very pleasant-looking liquor. He was just on the point of tasting it, when his good angel whispered to him that if he did so, he would straightway forget everything in his past existence, and become transformed into an elf; so he dashed the drink on the ground, snatched the whistle from the queen, and spurred his horse away. Where the drops fell on his horse from the horn, the hide was burnt. The elves followed him close, shrieking and crying fearfully, like the witches after Tam o' Shanter. Had they caught him, it may be supposed he would have fared worse than Tam's gray mare. Luckily, the direction he had taken was the way homewards. As he approached the castle, he found the portcullis down, and the lady and her guards standing waiting for him. They knew if he could only get over the moat, the *Trolls* could not injure him. Galloping up with the speed of the wind, he barely escaped being overtaken. At length, however, he sprang upon the bridge, got safely over, and it was drawn up after him. Then there stood on the other side great numbers of the little elves, moaning and crying piteously: 'Give us our horn and our whistle! Oh, do give them back to us!' And the elfin queen came forward, and offered countless diamonds and stores of gold to the lady if she would be pleased to give them up. But the lady replied: 'Thou wicked imp! thou shalt never have thy horn and whistle again. They shall remain here; and thou mayest cry till ye all come to judgment at doomsday!' Thereupon the queen said that if they persisted in keeping those elfin things, they must guard them carefully; for should they be at any time taken away, the castle would be burnt

down. And the lady answered: 'Begone, ye goblins! In the holy name, begone!' and at that word they all vanished into the air, and were never seen any more; though sometimes now the servants think they hear them round the castle. The horn and whistle were kept and shewn to visitors; but in a few days the bold huntsman who got them, and the horse he rode on, both died very suddenly. Nothing happened to the horn and whistle until many years afterwards, when the Danes, during an invasion, attacked the castle, and among other plunder, carried them off; and then it came to pass, as the fairy-queen had prophesied, that the castle was burned down. Subsequently, the things were brought back, and remained in the restored castle a long while; but being objects of great curiosity, they were visited and touched by so many people, that they became a little worn and injured, and were sent away to be mended, when suddenly, through some accident, the castle was burned down again. A third time, a hundred years later, people forgot the elfin queen's warning, and sent away the relics for some unknown reason; and the building was burned down once more. The family that owned them finally died out; and now they are in the possession of another family, and are kept in a glass case, so that nobody can touch them. The relics are allowed by scholars to be genuine antiquities; and the date assigned to the story in a printed narration is about the year 1490. Such a legend, however, is likely to have been the product of a much earlier period. Things of this sort require time to *grow*; and less than four hundred years seems hardly long enough, considering that the ascribed date of the huntsman's foray is more recent than the invention of the art of printing.

There are so many superstitions about the *Trolls*, and they appear to have reference to so remote an antiquity, that some antiquarian scholars have thought it possible the primeval inhabitants of Sweden might have survived, in some of the deep forests, till modern times. The boulders and rocking-stones, so common on the plains throughout the country, are always attributed to the *Trolls*. Usually, it is their supposed hatred to Christianity which led them to throw these at some newly erected church. There are a number of families still believing they derive their descent from the mingling of the children of men with these creatures. Many of the *Trolls* are said to be seen on the uninhabited rocks and islands which abound on the coast of Sweden, whither they were driven by the early Christians. 'Some sailors belonging to Bohuslan,' relates Thorpe, 'when once driven on a desert shore by a storm, found a giant sitting on a stone by a fire. He was old and blind, and rejoiced at hearing the northmen, because he was himself from their country. He requested one of them to approach and give him his hand, "that I may know," said he, "whether there is yet strength in the hands of the northmen." The old man, being blind, was not sensible that they took a great boat-hook, which they had heaved in the fire, and held out to him. He squeezed the hook as if it had been wax, shook his head, and said: "I find the northmen now have but little strength in their hands compared with those of old." A noble family in Sweden, the *Trolls*, derive their name from a bold deed of one of their ancestors, who struck off the head of a *Troll* queen that offered him magic drink in her horn. This horn, we are informed, was long preserved in the cathedral of Wexiö. It is supposed that the offspring of the *Trolls* are countless, but that they die when it thunders.

It would be hardly proper to close this article without noticing some of the *ghost-stories* which pass current among the Norse Folk. Not only are the lakes, and streams, and mountains infested with a supernatural population, but human habitations, as elsewhere, are liable to be haunted by the spirits of the departed.

'A lady,' says Mr Bracc, 'who is descended from the famous family of Oxenstiern, told me that while in her castle at W—, she observed one day the workmen making some repairs in the walls of one saloon, at the command of her father, and that they had placed a valuable painting on the floor. She was fearful some injury might happen to it, and she directed the workmen to hang it on an unoccupied nail in her chamber. The picture was a portrait of the old Chancellor Oxenstiern. On the other side of her chamber, though she did not then observe it, hung a portrait of Queen Christina. Now, as is well known, there was between these two during life a most bitter feud, which was never reconciled. This did not occur to her, however, and she undressed and retired to her bed as usual. In the night, she was aroused suddenly by a curious rustling; she listened, and it evidently came from the wall where the picture hung. She raised her head, and gazed at the old portrait by the light of the night-lamp, when she heard distinctly proceeding from it a deep hollow groan—then another—and then a third. She was fearfully alarmed, but really had not strength to shriek; and her room was at a distance on one wing of the castle, where she could only arouse people by an alarm-bell. She thought of arising and fleeing to her maid, when suddenly again came the sepulchral groans. She could not stir; her voice failed, and at length she fell back exhausted to sleep. The next morning, nothing seemed moved or different in the picture; "but I assure you," said she, "I removed the portrait at once to another room, and I have never been troubled with anything of the kind since."

Any one acquainted with nightmares, will have had experiences which will probably enable him to account for the origin of such stories. The singular thing about them is, that they are related, and evidently believed in, by intelligent persons. But such beliefs are so very common in Sweden, as to excite no surprise among any classes of society. 'I do not think,' said a Swedish gentleman to Mr Bracc, 'that out of every ten people you meet you could find one who had not encountered such adventures. Before I was in public life, I was a great deal among the peasantry. Many and many a night have I been called up to see or hear the *spökeri* (witchcraft or ghostcraft). The peasants would recount that in an upper room they had distinctly heard the spirits throwing the tin vessels and the chairs at each other—then a violent struggle between the demons, and then all would be quiet. At other times, regular steps would be heard passing over the floor, or lights be seen; sometimes the cattle and horses are attacked, and they stamp and neigh in an unaccountable manner. I always went at once, no matter what hour of the night, to the place which was haunted, to break up the delusion among the people. Sometimes in an attic I would find a cat sitting quietly in one corner; sometimes rats would run over the floor—more generally everything was still, and there were not the slightest signs of anything being moved.

The natural explanations which are sometimes found for the supposed supernatural appearances that occur among the northern people, do not materially tend to weaken the belief in their reality. There is a superstitious tendency in the Norse imagination which, fostered as it has been by natural circumstances for many ages, is extremely difficult to eradicate. The clergy find it one of their greatest obstacles to the inculcation of rational instruction, and hitherto their teachings appear to have had little or no effect upon it. No doubt, as education advances, and correct knowledge respecting nature and her processes becomes more general among the people, these superstitions will give way; but it is not unlikely they may maintain their ground in many places for another century or two; and, at any rate, we may be assured they will never finally die out, until the general mind of the

population shall have reached the stage of cultivation at which superstitions become naturally incredible. In the meanwhile, so long as they last, a certain curiosity may be expected to prevail concerning them; and in the information here collected and presented, a slight effort has been made to gratify it.

OCEOLA:

A ROMANCE.

CHAPTER XL.—'FIGHTING GALLAGHER.'

THE prisoner was confined in a strong, windowless block-house. Access to him would be easy enough, especially to those who wore epaulets. It was my design to visit him; but, for certain reasons, I forbore putting it in execution, so long as daylight lasted. I was desirous that my interview should be as private as possible, and therefore waited for the night.

I was influenced by other reasons: my hands were full of business; I had not yet done with Arne Ringgold.

I had a difficulty in deciding how to act. My mind was a chaos of emotions: hatred for the conspirators—indignation at the unjust behaviour of the agent towards Opeola—love for Mathias—now fond and trusting—anon doubting and jealous. Amid such confusion, how could I think with clearness?

Withal, one of these emotions had precedence—anger against the villain who intended to take my life was at that moment the strongest passion in my breast.

Hostility so heartless, so causeless, so deadly, had not failed to imbue me with a keen desire for vengeance; and I resolved to punish my enemy at all hazards.

He only, whose life has been aimed at by an assassin, can understand the deadly antipathy I felt towards Arne Ringgold. An open enemy, who act under the impulse of anger, jealousy, or fancied wrong, you may respect. Even the two white wretches, and the yellow runaway, I regarded only with contempt, as tools pilant for any purpose; but the arch-conspirator himself I now both hated and despised. So acute was my sense of injury, that I could not permit it to pass without some sort of retaliation, some effort to punish my wronger.

But how? Therein lay the uncertainty. How? A duel?

I could think of no other way. The criminal was still inside the law. I could not reach him, otherwise than by my own arm.

I well weighed the words of my sable counsellor, but the faithful fellow had spoken in vain, and I resolved to act contrary to his advice, let the hazard fall as it might. I made up my mind to the challenge.

One consideration still caused me to hesitate: I must give Ringgold my reasons.

He should have been welcome to them as a dying souvenir, but if I succeeded in only *half* killing him, or he in half killing me, how about the future? I should be showing my hand to him, by which he would profit; whereas, unknown to him, I now knew his, and might easily foil his designs.

Such calculations ran rapidly through my mind, though I considered them with a coolness that in after-thought surprises me. The incidents I had lately encountered—combined with angry hatred of this plausible villain—had made me fierce, cold, and cruel. I was no longer myself; and wicked as I may appear, I could not control my longings for vengeance.

I needed a friend to advise me. Who could I make the confidant of my terrible secrets?

Surely my ears were not deceiving me? No; in

was the voice of my old school-fellow, Charley Gallagher. I heard it outside, and recognised the ring of his merry laugh. A detachment of rifles had just entered the fort with Charley at their head. In another instant we had 'embraced.'

What could have been more opportune? Charley had been my 'chum' at college—my bosom-companion. He deserved my confidence, and almost upon the instant, I made known to him the situation of affairs.

It required much explanation to remove his incredulity: he was disposed to treat the whole thing as a joke—that is, the conspiracy against my life. But the rifle-shot was real, and Black Jake was by to confirm my account of it; so that my friend was at length induced to take a serious view of the matter.

'Bad luck to me!' said he, in Irish accent: 'it's the queerest case that iver came accraast your humble frind's experience. Mother o' Moses! the fellow must be the devil incarnate. Geordie, my boy, have ye looked under his instip?'

Despite the name and 'brogue,' Charley was not a Hibernian—only the son of one. He was a New-Yorker by birth, and could speak good English when he pleased; but from some freak of eccentricity or affectation, he had taken to the brogue, and used it habitually, when among friends, with all the rich garniture of a true Milesian fresh from the 'sod.'

He was altogether an odd fellow, but with a soul of honour, and a heart true as steel. He was no dunce either, and the man above all others upon whose coat-tail it would not have been safe to 'trid.' He was already notorious for having been engaged in two or three 'affairs,' in which he had played both principal and second, and had earned the bellicose appellation of 'Fighting Gallagher.' I knew what his advice would be before asking it—'Call the schoondrel out by all manes.'

I stated the difficulty as to my reasons for challenging Ringgold.

'Thru, *ma bohill!* You're right there; but there need be no trouble about the matter.'

'How?'

'Make the spalpeen challenge you. That's better—besides, it gives you the choice of waypons.'

'In what way can I do this?'

'Och! my innocent gossoon! Shure that's as ay as tumblin' from a haycock. Call him a liar; an' if that's not sufficiently disagreeable, twake his nose, or squirt your tobacco in his ugly countenance. That'll fetch him out, I'll be bail for ye.'

'Come along, my boy!' continued my ready counsellor, moving towards the door. 'Where is this Mister Ringgold to be sarched for? Find me the gint, and I'll shew you how to scratch his buttons. Come along wid ye!'

Not much liking the plan of procedure, but without the moral strength to resist, I followed this impetuous son of a Celt through the doorway.

CHAPTER XLI.

PROVOKING A DUEL.

We were scarcely outside before we saw him for whom we were searching. He was standing at a short distance from the porch, conversing with a group of officers, among whom was the dandy already alluded to, and who passed under the appropriate appellation of 'Beau Scott.' The latter was aid-de-camp to the commander-in-chief, of whom he was also a relative.

I pointed Ringgold out to my companion.

'He in the civilian dress,' I said.

'Och! man, ye needn't be so particular in your identification: that sarpint-look spakes for itself. Be my sow! it's an unwholesome look altogether.

That fellow needn't fear wather—the say'll niver drown him. Now, look here, Geordie, boy,' continued Gallagher, facing towards me, and speaking in a more earnest tone: 'Follow my advice to the letter! First trid upon his toes, an' see how he takes it. The fellow's got corns: don't ye see, he wares a tight boot? Give him a good scrouge; make him sing out. Or coorse, he'll ask you to apologise—he must—you won't. Shurely that'll do the bizness without further caremony? If it don't, then, by Jabus! hit him a kick in the latter end.'

'No, Gallagher,' said I, disliking the programme. 'It will never do.'

'Bad luck to it, an' why not? You're not goin' to back out, are ye? Think man! a villain who would murder you! an' maybe will some day, if you let him escape.'

'True—but'—

'Bah! no buts. Move up, an' let's see what they're talking about, anyhow. I'll find ye a chance, or my name's not Gallagher.'

Undetermined how to act, I walked after my companion, and joined the group of officers.

Of course, I had no thought of following Gallagher's advice. I was in hopes that some turn in the conversation might give me the opportunity I desired, without proceeding to such rude extremes.

My hopes did not deceive me. Arens Ringgold seemed to tempt his fate, for I had scarcely entered among the crowd, before I found cause sufficient for my purpose.

'Talking of Indian beauties,' said he, 'no one has been so successful among them as Scott here. He has been playing Don Giovanni ever since he came to the fort.'

'Oh,' exclaimed one of the newly arrived officers 'that does not surprise us. He has been a lady-killer ever since I knew him. The man who is irresistible among the belles of Saratoga, will surely find little difficulty in carrying the heart of an Indian maiden.'

'Don't be so confident about that, Captain Roberts. Sometimes these forest damsels are very shy of us pale-faced lovers. Lieutenant Scott's present sweetheart, cost him a long siege before he could conquer her. Is it not so, lieutenant?'

'Nonsense,' replied the dandy with a conceited smirk.

'But she yielded at last?' said Roberts, turning interrogatively towards Scott.

The dandy made no reply, but his simpering smile was evidently intended to be taken in the affirmative.

'O yes,' rejoined Ringgold, 'she yielded at last; and is now the "favourite," it is said.'

'Her name—her name?'

'Powell—Miss Powell.'

'What! That name is not Indian?'

'No, gentlemen; the lady is no savage, I assure you: she can play and sing, and read and write too—such pretty *billets-doux*. Is it not so, lieutenant?'

Before the latter could make reply, another spoke:

'Is not that the name of the young chief who has just been arrested?'

'True,' answered Ringgold; 'it is the fellow's name. I had forgotten to say she is his sister.'

'What! the sister of Ocoola?'

'Neither more nor less—half-blood like him too. Among the whites, they are known by the name of Powell, since that was the cognomen of the worthy old gentleman who begot them. Ocoola, which signifies "the Rising Sun," is the name by which he is known among the Seminoles; and her native appellation—ah, that is a very pretty name indeed.'

'What is it? Let us hear it; let us judge for ourselves.'

'Maumee.'

'Very pretty indeed!'

'Beautiful! If the damsel be only as sweet as her name, then Scott is a fortunate fellow.'

'Oh, she is a very wonder of beauty: eyes liquid and full of fiery love—long lashes; lips luscious as honeycombs; figure tall; bust full and firm; limbs like those of the Cyprian goddess; feet like Cinderella's—in short, perfection.'

'Wonderful. Why, Scott, you are the luckiest mortal alive. But, say, Ringgold! are you speaking in seriousness? Has he really conquered this Indian divinity? Honour bright—has he succeeded? You understand what I mean?'

'Most certainly,' was the prompt reply.

Up to this moment I had not interfered. The first words of the conversation had bound me like a spell, and I stood as if glued to the ground. My brain was giddy, and my heart felt as if the blood passing through it was molten lead. The bold enunciations had so staggered me, that it was some time before I could draw my breath; and more than one of the bystanders noticed the effect which the dialogue was producing upon me.

After a little, I grew calmer, or rather more resolute. The very despair that had passed into my bosom had the effect of steeling my nerves; and just as Ringgold uttered the flippant affirmative, I was ready for him.

'Liar!' I exclaimed; and before the red could mount into his cheek, I gave it a slap with the back of my hand, that no doubt helped to heighten the colour.

'Nately done!' cried Gallagher; 'there can be no mistake about the maynity of that.'

Nor was there. My antagonist accepted the act for what it was meant—a deadly insult. In such company, he could not do otherwise; and, mattering some indistinct threats, he walked away from the ground, attended by his especial friend, the lady-killer, and two or three others.

The incident, instead of gathering a crowd, had the contrary effect: it scattered the little group who had witnessed it; the officers retiring indoors to discuss the motives, and speculate as to when and where 'the affair would come off.'

Gallagher and I also left the ground; and, closeted in my quarters, commenced preparing for the event.

CHAPTER XLII.

THE CHALLENGE.

At the time of which I write, duelling was not uncommon in the United States army. In war-time, it is not uncommon yet, as I can testify from late experience. It is contrary to the regulations of the American service—as I believe it is of every other in the civilised world. Notwithstanding, an infringement of the *code militaire* in this regard is usually looked upon with leniency—more often 'winked at' than punished. This much I can affirm—that any officer in the American army who has received the 'lie direct,' will find more honour in the breach of this military rule than in its observance.

After all that has been said and written about duelling, the outcry against it is a sad sham, at least in the United States of America—nothing less than a piece of superb hypocrisy. Universal as has been this condemnation, I should not like to take shelter under it. I well know it would not protect me from 'being called by that ugly appellation, 'politreen.' I have noticed over and over again, that the newspapers loudest in their declamations against duelling, are the first to fling 'coward' in the teeth of him who refuses to fight.

It is even so. In America, moral courage, though

much bepraised, does not find ready credence. A refusal to meet the man who may challenge you is not thus explained. It is called 'backing out,' 'shewing the white feather;' and he who does this, need look no more upon his lady-love: she would 'flog him with her garters.'

More than once have I heard this threat, spoken by pretty lips, and in the centre of a brilliant circle. His moral courage must be great who would provoke such chastisement.

With such a sentiment over the land, then, I had nailed Arens Ringgold for a meeting; and I joyed to think I had done so without compromising my secret.

But ah! it was a painful provocation he had given me; and if he had been the greatest coward in the world, he could not have been more wretched than I, as I returned to my quarters.

My jovial companion could no longer cheer me, though it was not fear for the coming fight that clouded my spirits. Far from it—far otherwise. I scarcely thought of that. My thoughts were of Matinee—of what I had just heard. She was false—false—betraying, herself betrayed—lost—lost forever!

In truth was I wretched. One thing alone could have rendered me more so—an obstacle to the anticipated meeting—anything to hinder my revenge. On the duel now rested my hopes. It might enable me to disembarass my heart of the hot blood that was burning it. Not all—unless he too stood before me—he the seducer, who had made this misery. Would I could find pretext for challenging him. I should do so yet. Why had I not? Why did I not strike him for that smile? I could have fought them both at the same time, one after the other.

Thus I raved, with Gallagher by my side. My friend knew not all my secret. He asked what I had got 'against the aid-de-camp.'

'Say the word, Geordie, boy, an' we'll make a four-handed game ov it. Be Saint Patrick! I'd like mightily to take the shine out of that purty pay-cock!'

'No, Gallagher, no. It is not your affair; you could not give me satisfaction for that. Let us wait till we know more. I cannot believe it—I cannot believe it.'

'Believe what?'

'Not now, my friend. When it is over, I shall explain.'

'All right, my boy! Charley Gallagher's not the man to disturb your saycrets. Now, let's look to the bull-dogs, an' make shure they're in barking condition. I hope the escampe won't blab at head-quarters, an' disappoint us after all.'

It was my only fear. I knew that arrest was possible—probable—certain, if my adversary wished it. Arrest would put an end to the affair; and I should be left in a worse position than ever. Ringgold's father was gone—I had ascertained this favourable circumstance; but no matter. The commander-in-chief was the friend of the family—a word in his ear would be sufficient. I feared that the aid-de-camp Scott, instructed by Arens, might whisper that word.

'After all, he daren't,' said Gallagher; 'you driv the nail home, an' clinched it. He daren't do the dirty thing—not a bit ov it: it might get wind, an' thin he'd have the kettle to his tail; besides, as *bohll*, he wants to kill you anyhow; so he ought to be glad of the fine handy chance you've given him. He's not a bad shot, they say. Never fear, Geordie, boy! he won't back out this time: he must fight—he will fight. Ha! I told you so. See, yonder comes Apollo Belvidere! Holy Moses! how Phobos shines!'

A knock—'Come in'—the door was opened, and the aid-de-camp appeared in full uniform.

'To arrest me,' thought I, and my heart fell.

But no; the freshly written note spoke a different purpose, and I was relieved. It was the challenge.

'Lieutenant Randolph, I believe?' said the gentleman, advancing towards me.

I pointed to Gallagher, but made no reply.

'I am to understand that Captain Gallagher is your friend?'

I nodded assent.

The two faced each other, and the next instant were on rapiers; talking the matter over cool as cucumbers and sweet as sugar-plums.

From observation, I hazard this remark—that the politeness exhibited between the seconds in a duel cannot be surpassed by that of the most accomplished courtiers in the world.

The time occupied in the business was brief. Gallagher well knew the routine, and I saw that the other was not unacquainted with it. In five minutes, everything was arranged—time, place, weapons, and distance.

I nodded; Gallagher made a sweeping salaam; the aid-de-camp bowed stiffly and withdrew.

I shall not trouble you with my reflections previous to the duel, nor yet with many details of the affair itself. Accounts of these deadly encounters are common enough in books, and their sameness will serve as my excuse for not describing one.

Ours differed only from the ordinary kind in the weapon used. We fought with *rifles*, instead of swords or pistols. It was my choice—as the challenged party, I had the right—but it was equally agreeable to my adversary, who was as well skilled in the use of the rifle as I. I chose this weapon because it was the deadliest.

The time arranged was an hour before sunset. I had urged this early meeting in fear of interruption; the place, a spot of level ground near the edge of the little pond where I had met Haj-Ewa; the distance, ten paces.

We met—took our places, back to back—waited for the ominous signal, 'One, two, three'—received it—faced rapidly round—and fired at each other.

I heard the 'hist' of the leaden pellet as it passed my ear, but felt no stroke.

The smoke puffed upward. I saw my antagonist upon the ground; he was not dead: he was writhing and groaning.

The seconds, and several spectators who were present, ran up to him, but I kept my ground.

'Well, Gallagher?' I asked as my friend came back to me.

'Winged, by japers! You've spoilt the use of his dexter arm—bone broke above the elbow-joint.'

'That all?'

'Arrah, sowl! aren't it enough? Hear how the hound whimpers!'

I felt as the tiger is said to feel after tasting blood, though I cannot now account for my ferocity. The man had sought my life—I thirsted for his. This combined with the other thought had nigh driven me mad.

I was not satisfied, and would make no apology; but my antagonist had had enough; he was eager to be taken from the ground on any terms, and thus the affair ended.

It was my first duel, but not my last.

CHAPTER XLIII.

THE ASSIGNATION.

Our opponents passed silently away—the spectators along with them—leaving my second and myself upon the ground.

It was my intention to stay by the pond. I remembered the invitation of Haj-Ewa. By remaining, I should avoid the double journey. Better to await her coming.

A glance to the western horizon shewed me that the sun had already sunk below the tree-tops. The twilight would be short. The young moon was already in the heavens. It might be only a few minutes before Haj-Ewa should come. I resolved to stay.

I desired not that Gallagher should be with me; and I expressed the wish to be left alone.

My companion was a little surprised and puzzled at the request; but he was too well bred not to yield instant compliance.

'Why, Geordie, boy!' said he, about to retire, 'shurely there's something the matter wid ye? It isn't this thrifling spurt we've been engaged in? Didn't it indintirely to your satisfaction? Arrah, man! are ye sorry you didn't kill him dead? Be my trath, you look as milancholic an' downhearted as if he had killed you!'

'Dear friend, leave me alone. On my return to quarters, you shall know the cause of my melancholy, and why I now desire to part from your pleasant company.'

'Oh, that part I can guess,' rejoined he with a significant laugh: 'always a petticoat where there's shots exchanged. Niver mind, my boy—no saycrets for Charley Gallagher: I'm bad at keepin' them. Ov coorse, you're going to meet better company than mine; but laste you might fall in with worse—an' by my sowl! from what ye've towld me, that same isn't beyond the bownds or probability—take this little cheeper. I'm a great dog-braker, you know.' Here the speaker handed me a silver-call which he had plucked from his button. 'If anything inconvenient or disagreeable should turn up, put that between your lips, an' Charley Gallagher will be at your side in the minton of Jack Robison's name. Cupid spade ye with your lady-love! I'll go an' kill time over a tumbler ov nags till ye come.'

So saying, my warm-hearted friend left me to myself.

I ceased to think of him ere he was gone out of sight—even the bloody strife, in which I had been so recently engaged, glided out of my mind. Matinee—her falsehood and her fall—alone occupied my thoughts.

For a long while, I made no doubt of what I had heard. How could I, with proofs so circumstantial?—the testimony of those cognizant of the scandal—of the chief actor in it, whose silent smile spoke stronger than words. That smile of insolent triumph—why had I permitted it to pass without challenge, without rebuke? It was not too late—I should call upon him to speak plainly and point-blank—yes or no. If yes, then for a second duel more deadly than the first.

Notwithstanding these resolves to make my rival declare himself, I doubted not the damning truth; I endeavoured to resign myself to its torture.

For a long while was my soul upon the rack—more than an hour. Then, as my blood grew more cool, reflections of a calmer nature entered my mind; and at intervals, I experienced the soothing influence of hope; this especially, when I recalled the words of Haj-Ewa, spoken on the preceding night. Surely the maniac had not been mocking me? Surely it was not a dream of her delirious brain? A distorted mirage of memory—the memory of some far-away, long-forgotten scene, by her only remembered? No, no; her tale was not distorted—her thoughts were not delirious—her words were not mockeries!

How sweet it was to think so!

Yes—I began to experience intervals of placid thought; more than placid—pleasant.

Alas! they were evanescent. The memory of those bold meretricious phrases, those smiling innuendoes, dissipated or darkened them, as cumuli darken the sun. 'He had succeeded,' 'She was now his favourite,' 'Most certainly'—words worse than death. Withal it was a foul testimony on which to build a faith.

I longed for light, that true light—the evidence of the senses—that leaves nought uncertain. I should seek it with rash directness, reckless of the result, till it illumined her whole history, proving the past a disgrace, the future a chaos of utter despair. I longed for light; I longed for the coming of Haj-Ewa.

I knew not what the maniac wanted—something, I supposed, concerning the captive. Since noon, I had little thought of him. The mad queen went everywhere, knew every one; she must know all, understand all—ay, well understand: she, too, had been betrayed.

I repaired to our place of meeting on the preceding night; there I might expect her. I crossed the little ridge among the stems of the palmettoes; it was the direct route to the shadowy side of the tank. I descended the slope, and stood as before under the spreading arms of the live-oak.

Haj-Ewa was before me. A single moonbeam, slanting athwart the leaves, shone upon her majestic figure. Under its light, the two serpents glittered with a metallic lustre, as though her neck and waist were encircled with precious gems.

'Hinklas! pretty mico! you are come. Gallant mico! where was thine eye and thine arm that thou didst not kill the *Iste-hulwa*?'*

Ah! the hunter of the deer—
He was stricken so with fear
When he stood before the wolf,
The gaunt wicked wolf,
When he saw the snarling wolf,
He trembled so with fear
That unharmed the fierce wolf ran away.

Ha, ha, ha! was it not so, brave mico?'*

'It was not fear that hindered me, Ewa. Besides, the wolf did not go unscathed.'

'Ho! the wolf has a wounded leg—he will lick himself well again; he will soon be strong as ever. *Hulwak!* you should have killed him, fair mico, ere he bring the pack upon you.'

'I could not help my ill-luck. I am unfortunate every way.'

'Cooree, cooree—no. You should be happy, young mico; you shall be happy, friend of the red Seminole. Wait till you see'—

'See what?'

'Patience, *chepawnee!* To-night, under this very tree, you will see what is fair—you will hear what is sweet—and perchance Haj-Ewa will be revenged.'

This last phrase was spoken with an earnest emphasis, and in a tone that shewed a strong feeling of resentment against some one unknown. I could not comprehend the nature of the expected vengeance.

'His son—yes,' continued the maniac, now in soliloquy, 'it must be—it must: his eyes, his hair, his form, his gait, his name; his son and hers. O Haj-Ewa will have revenge.'

Was I myself the object of this menace? Such a thought entered my mind.

'Good Ewa! of whom are you speaking?'

Roused by my voice, she looked upon me with a bewildered stare, and then broke out into her habitual chant:

'Why did I trust to a pale-faced lover?
Ho, ho, ho!' &c.

Suddenly stopping, she seemed once more to remember herself, and essayed a reply to my question.

* Literally, bad man—villain.

'Whom, young mico—of him the fair one—the wicked one—the *Wykome hulwa*.* See! he comes, he comes! Behold him in the water. Ho, ho! it is he. Up, young mico! up into thy leafy bower: stay till Ewa comes! Hear what you may hear—see what you may see; but, for your life, stir not till I give you the signal. Up, up, up!'

Just as on the preceding night, half lifting me into the live-oak, the maniac glided away amidst the shadows.

I lost no time in getting into my former position, where I sat silent and expecting.

The shadow had grown shorter, but there was still enough to shew me that it was the form of a man. In another moment, it vanished.

Scarcely an instant had elapsed, ere a second was flung upon the water, advancing over the ridge, and as if following the track of the former one, though the two persons did not appear to be in company.

That which followed I could trace in full outline. It was the figure of a woman, one whose upright bearing and free port proved her to be young.

Even the shadow exhibited a certain symmetry of form, and gracefulness of motion, incompatible with age. Was it still Haj-Ewa? Had she gone round through the thicket, and was now following the footsteps of the man?

For a moment I fancied so; but I soon perceived that my fancy was astray.

The man advanced under the tree. The same moonbeam, that but the moment before had shone upon Haj-Ewa, now fell upon him, and I saw him with sufficient distinctness: he was the aid-de-camp.

He stopped, took out his watch, held it up to the light, and appeared to be inquiring the hour.

But I heeded him no further. Another face appeared under that silvery ray—false and shining as itself: it was the face that to me seemed the loveliest in the world—the face of Maimee.

AT BELTON, LINCOLNSHIRE:

JUNE 18, 1857.

'Twas night: the crescent moon from out the west,
Over a bank of clouds looked forth, and shed
A gentle brightness o'er the woods and fields;
A lulling murmur from the river came,
And quiv'ring zephyrs toyed with leaf and flower.
When roused by the beetle's birring hum—
Where brooded o'er their young his loving mate,
In covert low edged round with buds and flowers—
Up rose the nightingale: first from his throat
Came flute-like forth his opening notes,
Then swelling into rapture, fell and rose
In jocund song. Now ringing echo-like,
He note to note replied in octave bright,
'Till in his ecstasy, full forth he poured
His jug, jug, jug. Then lower fell his song,
As if in converse with his mate he spoke,
In tones of fond caress, how warm within
He felt the burden of his love to be.
Catching her quick response, his triumph rang,
In loud soprano, till the air and trees
Were full of melody and sparkling notes
Caught by the echo near, then bounding back,
Came leaping into listening ears like hail.

Grantham.

SATURDAY, MARCH 27, 1858.

PRICE 1½d.

MRS B.'S ALARMS.

Mrs B. is my wife; and her alarms are those produced by a delusion under which she labours, that there are assassins, gnomes, vampires, or what not in our house at night, and that it is my bounden duty to leave my bed at any hour or temperature, and to do battle with the same, in very inadequate apparel. The circumstances which attend Mrs B.'s alarms are generally of the following kind. I am awakened by the mention of my baptismal name, in that peculiar species of whisper which has something uncanny in its very nature, besides the dismal associations which belong to it, from the fact of its being used only in melodramas and sick-rooms;

'Henry, Henry, Henry.'

How many times she has repeated this, I know not; the sound falls on my ear like the lapping of a hundred waves, or as the 'Robin Crusoe, Robin Crusoe' of the parrot smote upon the ear of the terrified islander of Defoe; but at last I wake, to view, by the dim fire-light, this vision: Mrs B. is sitting up beside me, in a listening attitude of the very intensest kind; her night-cap (one with cherry-coloured ribbons, such as it can be no harm to speak about) is tucked back behind either ear; her hair—in paper—is rolled out of the way upon each side like a banner furling; her eyes are rather wide open, and her mouth very much so; her fingers would be held up to command attention, but that she is supporting herself in a somewhat absurd manner upon her hands.

'Henry, did you hear that?'

'What, my love?'

'That noise. There it is again; there—there.'

The disturbance referred to is that caused by a mouse nibbling at the wainscot; and I venture to say so much in a tone of the deepest conviction.

'No, no, Henry; it's not the least like that: it's a file working at the bars of the pantry-window. I will stake my existence, Henry, that it is a file.'

Whenever my wife makes use of this particular form of words, I know that opposition is useless. I rise, therefore, and put on my slippers and dressing-gown. Mrs B. refuses to let me have the candle, because she will die of terror if she is left alone without a light. She puts the poker into my hand, and with a gentle violence is about to expel me from the chamber, when a sudden thought strikes her.

'Stop a bit, Henry,' she exclaims, *'until I have looked into the cupboards and places;'* which she proceeds to do most minutely, investigating even the short drawers of a foot and a half square. I am at length dismissed upon my perilous errand, and

Mrs B. locks and double-locks the door behind me with a celerity that almost catches my retreating garment. My expedition therefore combines all the dangers of a sally, with the additional disadvantage of having my retreat into my own fortress cut off. Thus cumbrously but ineffectually caparisoned, I perambulate the lower stories of the house in darkness, in search of that disturber of Mrs B.'s repose, which, I am well convinced, is behind the wainscot of her own apartment, and nowhere else. The pantry, I need not say, is as silent as the grave, and about as cold. The great clock in the kitchen looks spectral enough by the light of the expiring embers, but there is nothing there with life except black beetles, which crawl in countless numbers over my naked ankles. There is a noise in the cellar such as Mrs B. would at once identify with the suppressed converse of anticipative burglars, but which I recognise in a moment as the dripping of the small-beer cask, whose tap is troubled with a nervous disorganisation of that kind. The dining-room is chill and cheerless: a ghostly arm-chair is doing the grim honours of the table to three other vacant seats, and dispensing hospitality in the shape of a mouldy orange and some biscuits, which I remember to have left in some disgust, about — Hark! the clicking of a revolver? No; the warning of the great clock—one, two, three. . . . What a frightful noise it makes in the startled ear of night! Twelve o'clock. I left this dining-room, then, but three hours and a half ago; it certainly does not look like the same room now. The drawing-room is also far from wearing its usual snug and comfortable appearance. Could we possibly have all been sitting in the relative positions to one another which these chairs assume? Or since we were there, has some spiritual company, with no eye for order left among them, taken advantage of the remains of our fire to hold a reunion? They are here even at this moment perhaps, and their gentlemen have not yet come up from the dining-room. I shudder from head to foot, partly at the bare idea of such a thing, partly from the naked fact of my exceedingly unclothed condition. They do say that in the very passage which I have now to cross in order to get to Mrs B. again, my great-grandfather 'walks;' in compensation, I suppose, for having been prevented by gout from taking that species of exercise while he was alive. There are more things in heaven and earth than are dreamt of in your philosophy, I think as I approach this spot; but I do not say so, for I am well-nigh speechless with the cold—yes, the cold: it is only my teeth that chatter. What a scream that was! There it comes again, and there is no doubt

this time as to who is the owner of that terrified voice. Mrs B.'s alarms have evidently taken some other direction. 'Henry, Henry,' she cries in tones of a very tolerable pitch. A lady being in the case, I fly upon the wings of domestic love along the precincts sacred to the perambulations of my great-grandfather. I arrive at my wife's chamber; the screams continue, but the door is locked.

'Open, open!' shout I. 'What on earth is the matter?'

There is silence; then a man's voice—that is to say, my wife's voice in imitation of a man's—replies in tones of indignant ferocity, to convey the idea of a life-preserver being under the pillow of the speaker, and ready to his hand: 'Who are you—what do you want?'

'You very silly woman,' I answer; not from unpoliteness, but because I find that that sort of language recovers and assures her of my identity better than any other—'why, it's I.'

The door is then opened about six or seven inches, and I am admitted with all the precaution which attends the entrance of an ally into a besieged garrison.

Mrs B., now leaning upon my shoulder, dissolves into copious tears, and points to the door communicating with my attiring-chamber.

'There's sur—sur—somebody been anoring in your dressing-room,' she sobs, 'all the time you were away.'

This statement is a little too much for my sense of humour, and although sympathising very tenderly with poor Mrs B., I cannot help bursting into a little roar of laughter. Laughter and fear are deadly enemies, and I can see at once that Mrs B. is all the better for this explosion.

'Consider, my love,' I reason—'consider the extreme improbability of a burglar or other nefarious person making such a use of the few precious hours of darkness as to go to sleep in them! Why, too, should he take a bedstead without a mattress, which I believe is the case in this particular supposition of yours, when there were feather-beds unoccupied in other apartments? Moreover, would not this be a still greater height of recklessness in such an individual, should he have a habit of snoring?'

A slight noise in the dressing-room, occasioned by the Venetian blind tapping against the window, here causes Mrs B. to bury her head with extreme swiftness, ostrich-like, beneath the pillow, so that the peroration of my argument is lost upon her. I enter the suspected chamber—this time with a lighted candle—and find my trousers, with the boots in them, hanging over the bedside something after the manner of a drunken marauder, but nothing more. Neither is there anybody reposing under the shadow of my boot-tree upon the floor. All is peace there, and at eleven and seven as I left it upon retiring—as I had hoped—to rest.

Once more I stretch my chilled and tired limbs upon the couch; sweet sleep once more begins to woo my eyelids, when 'Henry, Henry,' again dissolves the dim and half-formed dream.

'Are you certain, Henry, that you looked in the shower-bath? I am almost sure that I heard somebody pulling the string.'

No grounds, indeed, are too insufficient, no suppo-

sition too incompatible with reason for Mrs B. to build her alarms upon. Sometimes, although we lodge upon the second story, she imagines that the window is being attempted; sometimes, although the register may be down, she is confident that the chimney is being used as the means of ingress.

Once, when we happened to be in London—where she feels, however, a good deal safer than in the country—we had a real alarm, and Mrs B., since I was suffering from a quinsy—contracted mainly by my being sent about the house at night in the usual scanty drapery—had to be sworn in as her own special constable.

'Henry, Henry,' she whispered upon this occasion, 'there's a dreadful cat in the room.'

'Pooh, pooh!' I gasped; 'it's only in the street. I've heard the wretches. Perhaps they are on the tiles.'

'No, Henry. There, I don't want you to talk since it makes you cough; only listen to me. What am I to do, Henry? I'll stake my existence that there's—' Ugh, what's that?'

And, indeed, some heavy body did there and then jump upon our bed, and off again, at my wife's interjection, with extreme agility. I thought Mrs B. would have had a fit, but she hadn't. She told me, dear soul, upon no account to venture into the cold with my bad throat. She would turn out the beast herself, single-handed. We arranged that she was to take hold of my fingers, and retain them, until she reached the fireplace, where she would find a shovel or other offensive weapon fit for the occasion. During the progress of this expedition, however, so terrible a caterwauling broke forth, as it seemed, from the immediate neighbourhood of the fender, that my disconcerted helpmate made a most precipitate retreat. She managed, after this mishap, to procure a light, and by a circuitous route, constructed of tables and chairs, to avoid stepping upon the floor, Mrs B. obtained the desired weapon. It was then much better than a play to behold that heroic woman defying grimalkin from her eminence, and to listen to the changeful dialogue which ensued between herself and that far from dumb, though inarticulately speaking animal.

'Puss, puss, pussy—poor pussy.'

'Miau, miau, miau,' was the linked shrillness, long drawn out, of the feline reply.

'Poor old puss, then, was it ill? Puss, puss. Henry, the horrid beast is going to fly at me! Whist, whist, cat.'

'Ps-s-s-s, ps-s-s-s, mian; ps-s-s-s-s-s-s,' replied the other in a voice like fat in the fire.

'My dear love,' cried I, almost suffocated with a combination of laughter and quinsy, 'you have never opened the door: where is the poor thing to run to?'

Mrs B. had all this time been exciting the bewildered animal to frenzy by her conversation and shovel, without giving it the opportunity of escape, which, as soon as offered, it took advantage of with an expression of savage impatience partaking very closely indeed of the character of an oath.

This is, however, the sole instance of Mrs B.'s having ever taken it in hand to subdue her own alarms. It is I who, ever since her marriage, have done the duty, and more than the duty, of an efficient house-dog, which, before that epoch, I understand was wont to be discharged by one of her younger sisters. Not seldom, in these involuntary rounds of mine, I have become myself the cause of alarm or inconvenience to others. Our little foot-page, with a

courage beyond his years, and a spirit worthy of a better cause, very nearly transfixed me with the kitchen-spit as I was trying, upon one occasion, the door of his own pantry. Upon another nocturnal expedition, I ran against a human body in the dark—that turned out to be my brother-in-law's, who was also in search of robbers—with a shock to both our nervous systems such as they have not yet recovered from. It fell to my lot upon a third to discover one of the rural police up in our attics, where, in spite of the increased powers lately granted to the county constabulary, I could scarcely think he was entitled to be. I once presented myself, an uninvited guest, at a select morning entertainment—it was at 1.30 A.M.—given by our hired London cook to nearly a dozen of her male and female friends. No wonder that Mrs B. had 'staked her existence' that night that she had heard the area gate 'go.' When I consider the extremely free and unconstrained manner in which I was received, poker and all, by that assembly, my only surprise is that they did not signify their arrivals by double knocks at the front door.

On one memorable night, and on one only, have I found it necessary to use that formidable weapon which habit has rendered as familiar to my hand as its flower to that of the Queen of Clubs.

The gray of morning had just begun to steal into our bedchamber, when Mrs B. ejaculated with unusual vigour: 'Henry, Henry, they're in the front drawing-room; and they've just knocked down the parrot-screen.'

'My love,' I was about to observe, 'your imaginative powers have now arrived at the pitch of *clairvoyance*,' when a noise from the room beneath us, as if all the fire-irons had gone off together with a bang, compelled me to acknowledge to myself at least that there was something in Mrs B.'s alarms at last. I trod down stairs as noiselessly as I could, and in almost utter darkness. The drawing-room door was ajar, and through the crevice I could distinguish, despite the gloom, as many as three muffled figures. They were all of them in black clothing, and each wore over his face a mask of crape, fitting quite closely to his features. I had never been confronted by anything so dreadful before. Mrs B. had cried 'Wolf!' so often that I had almost ceased to believe in wolves of this description at all. Unused to personal combat, and embarrassed by the novel circumstances under which I found myself, I was standing undecided on the landing, when I caught that well-known whisper of 'Henry, Henry' from the upper story. The burglars caught it also. They desisted from their occupation of examining the articles of *vertu* upon the chimney-piece, while their fiendish countenances relaxed into a hideous grin. One of them stole cautiously towards the door where I was standing. I heard his burglarious feet, I heard the 'Henry, Henry!' still going on from above stairs; I heard my own heart pit-a-pat, pit-a-pat within me. It was one of those moments in which one lives a life. The head of the craped marauder was projected cautiously round the door, as if to listen. I poised my weapon, and brought it down with unerring aim upon his skull. He fell like a bullock beneath the axe; and I sped up to my bedchamber with all the noiselessness and celerity of a bird. It was I who locked the door this time, and piled the wash-hand-stand, two band-boxes, and a chair against it with the speed of lightning.

Was Mrs B. out of her mind with terror that at such an hour as that she should indulge in a paroxysm of mirth?

'Good heavens!' I cried, 'be calm, my love; there are burglars in the house at last.'

'My dear Henry,' she answered, laughing so that the tears quite stood in her eyes, 'I am very sorry; I

tried to call you back. But when I sent you down stairs, I quite forgot that this was the morning upon which I had ordered the sweeps!'

One of those gentlemen was at that moment lying underneath with his skull fractured, and it cost me fifteen pounds to get it mended, besides the expense of a new drawing-room carpet.

It is but fair to state the primary cause to which all Mrs B.'s alarms, and, by consequence, my own little personal inconveniences, are mainly owing. Mrs B.'s mamma was one of the last admirers of the *Old Manor House* and *Mysteries of the Castle* school of literature, and her daughters were brought up in her own faith: that Mrs Radcliffe was a painter of nature, as it appears on earth; and that Mr Matthew Lewis had been let into the great secret of what was going on—as they say at St Stephen's—'in another place.' So nervous, indeed, did my respected mother-in-law contrive to make herself throughout her lifetime, by the perusal of these her favourite books, that it was rumoured that she married each of her four husbands at least as much from a disinclination to be without a protector during the long watches of the night, as from any other cause. Mrs B. herself was haunted in her earlier years with the very unpleasant notion that she was what I believe the Germans call a *doppelgänger*: that there was a duplicate of her going about the world at the same time; and that some day or other—or night—they would have a distressing meeting. And, moreover, at last they did so, and in the following manner. Her mamma was residing for a few days at Keswick, supping full of horrors in the German division of the late Mr Southey's library every evening, and enjoying herself, doubtless, after her own peculiar fashion, when she suddenly felt ill, or thought she was falling, and sent a post-chaise, express, to fetch her daughter (Mrs B.), who happened to be staying at that time with some friends at Penrith. The long mountain road was then by no means a good one; and it may be easily imagined that nothing but filial duty would have induced my *doppelgänger* to have started upon such a journey at dusk—although it was sure to be a fine moonlight night—and alone. Mrs B., however, being warm and comfortable, went off to sleep very soon, like any boulder, nor did she wake until the chaise had skirted Ullswater, and was within a few miles of home. She had looked carefully under both seats, and even into the side-pockets of the carriage before starting, to make sure that there was no other passenger: and yet there was now a form sitting upon the opposite cushions—a female form, muffled up in much clothing, but with a face pale in the moonlight, with eyes half shut, yet with a look of haggard meaning in them, steadily fixed upon her own. It was herself! It was Mrs B.'s double! The dreadful hour was come. The poor girl closed her eyelids to keep off the horrid sight, and tried to reason with herself upon the impossibility of the thing being really there, but in vain. She had been thoroughly awake, she was sure; the vision was not the offspring of a dis-tempered brain, for she felt collected, and even almost calm. Venturing to steal another look at it, there it still sat, peering with half-shut eyes into her face with the same curious anxiety as before. Not even when they rambled over Keswick stones, nor until she felt herself being lifted out in the post-boy's arms, did she trust herself to look forth again. The carriage she had just quitted was empty. 'There was something sitting there, man,' said she solemnly, pointing to the vacant cushions. 'Yes, miss,' replied he, pointing to a huge package on the ground beside them; 'I promised to bring it on for a poor man, a cabinet-maker at Pooley Bridge, and seeing you were asleep when we stopped there, I made bold to put it upon the opposite seat. I hope it did not

inconvenience you, miss. It was only a looking-glass; and as I know pretty young ladies don't object to seeing themselves in looking-glasses, I turned its face towards you.'

A STRUGGLE FOR LIFE AND RECOGNITION.

A SKETCH OF LITERARY HISTORY.

In the latter half of the last century, the university of Leipzig was twice honoured in a way that is seldom the privilege of the same seat of learning: in the year 1765 Wolfgang Goethe, and in 1781 Friedrich Richter, matriculated in it. No further merit, however, belongs to Leipzig, either in the case of Goethe or of Jean Paul. A striking parallel is offered in the academic lives of the two poets at the Saxon university. The son of the Frankfurt patrician was designed for the study of jurisprudence, without either choice or opposition on his part; and with just as little personal preference the son of the widow of Hof was devoted to the study of theology. Both, at first, regularly attended certain lectures, rather, however, as critics than as students; both were accustomed, though yet mere lads, to regard themselves as equal to the men whom age and experience, office and distinction, had placed far above them, and to try their strength with every authority, fearless of an overthrow. Where is the wonder that the religious awe, with which they ought to have regarded such high dignitaries, had dwindled down to nothing? Both Goethe and Richter quickly separated themselves from all learned circles and companions, their original plans of study were abandoned, their intended professions—the law of the one, and the divinity of the other—were renounced in favour of a multitude of other objects; both worked hard in all directions, read books, and wrote poems, excerpts, and notices; neither of them received or expected any guidance from the university, but each laboured, by rigorous self-culture, to lay the foundation of his own intellectual life. Both roamed the fields and the woods, had a seeing eye and a sensitive mind for the beautiful and the living, recognised the great and the whole in the minute and the particle; both greatly preferred the blue heavens, the misty heights at morning dawn, the green forest, and silent nature in her peaceful majesty, to the speaking professors on their wooden chairs, and the choking atmosphere and dust of a lecture-room: on which account both were regarded as bad students. When young Goethe returned to his native city, many a tongue was eager to defame him; and in whatever company he appeared, whispers began to circulate about him as a wild and riotous youth. The scandal-mongers of Hof acted in just the same manner towards Richter, when he fancied he could go on with his writing just as well at his mother's, as in Leipzig, where he met with nothing but hunger and hardship: for years he was regarded as a wild and unbridled genius. Twice ten years afterwards, the best and noblest spirits of the time listen to the words of the sage of Weimar as to an oracle; and ladies of quality are found crowding the antechamber of the author of *Titan*, begging a lock of his hair.

In the features presented, Richter's residence in Leipzig bore a perfect resemblance to that of Goethe; in others, the most striking distinctions are apparent. The university men set up a loud laugh at the Frankfurt freshman, on account of his old-fashioned wardrobe; but at the same time they secretly envied him for the large remittances and letters of credit with which he was furnished. Jean Paul met with no ridicule on account of his large wardrobe, but with plenty because of his poor and torn attire; instead of having credit at the bankers, he was only too happy when he could earn his dinner from day to day. Goethe

took private lessons of painters and artists for recreation and pleasure; Richter gave them, 'because the prison fare of bread and water depended upon them.' From Oeser's studio Goethe sauntered to the drawing-room of the Breitkopf family, or gossipied at the Clavier with Corona Schröter, or dined and danced at the hotel at Dölitz with mine host's amiable daughter, or wrote songs for Annette Schönpf, and played them with her. Jean Paul lodged in an out-of-the-way garret, and the only visits he paid were to beg: if they had only been successful! Bankruptcy was advancing with rapid strides upon the finances of the young theologian, every prop of his house was failing, the widow was alone with her infant children, and under the pressure of extreme destitution, wrote bitter lamentations. Fate seemed to have let her blood-hounds loose upon our hero. It was not that poverty which Horace admonishes the Roman youth to accustom themselves to look upon, which had burst upon him—

Angustam, amice, pauperiem pati
Robustus acri militia puer
Condiscat—

poverty not in the form of hardness and abstemiousness, but in the shape of ghastly, hollow-eyed destitution. He pressed his suit among the professors, but the professors had amanuenses and *famuli*, native lads of the town, and most diligent attendants at lectures, whose exemplary virtues secured them the preference. The situations were few, and the applicants many. Strangers coming to Leipzig found the local charities reserved for local purposes.

The battle-field tries the quality of our armour. Weak souls bend before the first storm of adversity; not so, however, the brave spirits that have within them an unconquerable strength and freedom of will, and proud hearts, that nothing can crush. Richter, perhaps, was fired with some thoughts of ambition when he exchanged the solitude of his quiet village for the driving bustle of Leipzig; dreamy fancies hovered round him when he was in company with distinguished men of science, and a gentle voice whispered to him that he would one day be as famous as any of them. The day of hope had dawned brilliantly on his horizon, but as rapidly as a dream its glow vanished before the rough realities of the world. Jean Paul was not disposed, however, to admit that evening had come down upon his soul. It is true, dark thoughts did at times steal upon him, but a livelier, loftier stoicism taught him to overcome them. He possessed a bold, elastic humour; and all his unsuccessful suits, vain toils, and thick-coming misfortunes, he used to welcome with a quiet and severe irony. 'Misfortune,' he used to say, 'is like a nightmare—the moment you begin to fight with it, or to bestir yourself, it is gone. What is poverty? Where is he that complains of it? The pain is only like the piercing of a maiden's ears, in order to hang jewels in the wounds.' A youth who feels and reasons in this way, and who studies his reasonings with such poetry, will find or make a way for himself in the world. 'Viam aut inveniam aut faciam!' as his motto expresses it.

He set out with the conviction that the only successful plan of resisting sufferings, destitution, and starvation, was downright uninterrupted work. He began, mindful of his maxim, by preparing for fight. He had now finally abandoned theology; literary labours must henceforth be the stay of his life. In his little bow-windowed chamber, the philosopher of nineteen thinks and writes night and day. The *Greenland Processes* are ready. The manuscript is taken to the nearest bookseller, and in an hour is returned to its author. A second, a third proposal, with like results. Now he goes about among the publishers, imploring them, as he had before done the professors, and wit-

the like invariable refusals. How ignorant of the world this scribbler must be, to fancy that a publisher who knows what he is about, will, in circumstances so unfavourable to the bookselling craft—which indeed always exist!—undertake, as soon as he is asked, the printing of a work whose author has never been heard of, whom no one patronises, no one recommends! What prodigious assumption, too, to expect payment! If the work had been of a popular nature, and he had said nothing about twenty louis-d'ors, the case might have been different, but a book like that, and a price!

The *Greenland Processes* continued to wander from one office to another, from this city to that, their author in the meanwhile having to solve the problem, whether it were possible to live upon nothing, and how? At length a Potosi was discovered in Berlin: an adventurous speculator, Voss by name, purchased the right, for sixteen louis—a reduction of four from the twenty—of bringing Jean Paul into the market!

I scarcely know with what to compare the feeling of a young writer who holds his first printed essay in his hands: a joy, a pride overpowers him—an ecstacy that swells all the higher from the consciousness (whether he will confess it or not) that he has taken the first step towards immortality. The critics take care to dispel all such pleasing illusions. A letter from his mother did the work as effectually in the mind of the author of the *Greenland Processes*. The good woman, hearing that her son had published a book, began to believe it at last possible that he might actually produce a sermon; so she wrote to Friedrich, desiring him to come to Hof, where there was a chance of his being permitted to preach in the Hospital Church. Such a proposal operated like a cold bath on any remains there might have been of the author's self-satisfaction. Jean Paul's answer shews he thought no better of his private critic than modern writers do of official reviewers. 'What is a sermon,' returned he, 'but something every student can make and deliver? But do you suppose that all your clergymen in Hof can understand a line of my book, to say nothing of being able to write it?'

Unfortunately for Richter, the speculation Voss embarked in did not succeed: the *Greenland Processes* was printed, but nobody bought or read the book. The world had something better to do; far greater trifles claimed its attention. The Cagliostroians and Rosicrucians occupied the attention of politicians; the fashionable world was just then horrified at the wife of one of the court-councillors passing the lady of the president without greeting her. In another rank, a dreadful tale was going the round of the tea-tables: the comptroller's wife, forgetful of her station, had given orders for a new velvet mantle with a broad fringe! A new actress had appeared in one of the theatres, or some syren's bell-like voice was to be heard; to-day there was to be a procession, and to-morrow a deserter was to be shot. How, in the face of so many comedies and tragedies, could time or inclination be found for reading the *Greenland Processes*? Just as the public ignored the work, so did the critics. Editors and reviewers disdained to notice a writer who had neither contributed to nor corresponded with them. A solitary scribe in Leipzig condescended, with an undisguised sneer, to notice the work in these terms: 'Much, perhaps all, the author has written with great bitterness against literature, theology, wives, coxcombs, &c., may be true, but we have no doubt whatever that the attempt at wit, which is evident on every page, will excite disgust in the mind of the rational reader, and lead him to throw the book aside with contempt.'

A potosi of sixteen louis-d'ors is very soon exhausted; a fresh shaft must be sunk. The *Selections from the Papers of the Devil* was tried; but Voss declined the publication, vehemently protesting that he had

suffered quite enough loss by the *Greenland Processes*. The manuscript travelled over all Germany, and from every journey returned with the invariable reply: 'We thank you for your esteemed offer, but regret that our time and resources are fully engrossed by other undertakings.'

A ship is dashed to pieces on a rock; the crew are drowning; boards and planks, spars and masts, are drifting about amid the waves; from the surging flood a hand is thrust up; it grasps a beam, and holds fast by it, and the elements lose one of their victims. The demons of the sea are laughing; sure of their prey, they mock the struggle of the swimmer: 'Look, poor wretch; stare your very eyes blind; wave your white signal in the wind, and burst with your wail of anguish: but no sail comes in sight. Tremble, and say your last prayer, if you can; for see, there swims the shark: a moment, and all is over with you!' The situation has often been represented in smaller or larger paintings: it was the situation of Richter. He had shouted himself hoarse, and the only answer to his cry had been the murmur of the waves; he had looked himself blind, and the white sail—the letter that announced the acceptance of his manuscript—had never hove in sight. The shark swims towards him—the prospect of disgrace and destitution! Are his lips uttering their last prayer? No! Richter will fight with the shark for life or death.

Weeks and months rush past us like the wind; we see not from whence the whirlwind comes nor whither it goes. A morning chases away the evening; to-day replaces yesterday; we complete another year, we know not how, we whose lives are happy, or even tolerably so. But the poor, the unfortunate? Time flies with rapid wing over plenty and enjoyment, but slowly the days and hours of poverty drag their lengths along. In winter, spring is longed for on account of its lengthening days and greater warmth; in summer, the shorter days of autumn are looked forward to, which yield a few hours more rest to the weary body. In this manner, during his three years' residence in Leipzig, Jean Paul told off his evil hours and dreary days; he deluged the journals and newspapers with essays and treatises, wrote verses to order, also congratulations and wedding-eve jokes, and filled whole chests with the extracts he had made from borrowed books. By this means, indeed, he became possessed of a library, for books he did not possess. A vehemence, but yet measured, heat burned within him. Necessity and destitution had lost their sting for him; he has looked despair in the face, and found that it has nothing maddening for him. His philosophy consoles him with the assurance that hunger and nakedness, perils and contempt, yea oftentimes the cross and the poisoned cup, have been the reward the world has given for wisdom. In all ages and countries the world has neglected its benefactors and persecuted its poets and instructors: Roger Bacon and Galileo pined away in the prisons of the inquisition; Torquato Tasso was confined in the cell of a madhouse; Camoens died in the streets of Lisbon, a beggar; and Burns, a thoroughbred steed of Phœbus, was compelled to drudge all his days in the gear of a cart-horse. But the gold that is thrown into the hottest melting-pot comes out the purest, and the canary-bird sings all the sweeter the longer it has been trained in a darkened cage.

Jean Paul betook himself to literature, in the first instance, as the only means of providing himself with a living; he wrote, in fact, to get money—to live. In the further prosecution of this course, the material aim gradually began to disappear. Jean Paul will labour on, and think and feel, and will still demand, and at length receive recognition; literature ceases to be a means, and becomes an end with him; the struggle for existence merges in a struggle for recognition.

Many years ago, at Paris, in the early dawn, a young

man was discovered hanging under the eaves of a house, close by the trellis of a window. A thin silken cord tightly twisted round his throat, had done the hangman's work. The scene quickly attracted all the curious and the idle. The noble, aristocratic features of the dead, the delicate white hands, plainly showed that the unfortunate man had at one time occupied a higher position than the tattered clothes in which he was concealed would lead one to suppose. His person was searched for papers that might throw some light upon the event; nothing was found, however; he had kept everything to himself like a true philosopher. Passers-by at length identified him. This suicide in rags was one of the most distinguished and brilliant geniuses of modern French literature, whose wit threw every saloon and boudoir into ecstacy—Gerhard de Nerval. In order that he might live, he also had grasped the pen, and had looked hopefully forward to recognition and distinction. He had been living a long while dissatisfied and miserable; by night, he roamed through the streets of the great city like a runaway dog; his desk and seat were the table and bench of the commonest tavern; he frequently sought sleep and oblivion in the most wretched dens, side by side with thieves and the most reprobate of beings, the scum of humanity. Thus had he been thrust about till, all hopes being now at an end, he bethought him that dying was perhaps a little better than living. He had looked for a home, and now the great quartermaster, death, had at length assigned him an abode.

Whatever may be thought of this suicide, it is unquestionably the nobler heroism which enables a man to endure, without rest or weariness, to the last. That Jean Paul, in his darkest hours when crushed to the lowest extremity by the miseries of the world, never lost faith in himself, never listened to the gloomy tempter, but 'laughed so long in the face of fortune that it began to smile upon him in return'—this indeed commands admiration as a rare and worthy heroism.

He left Leipzig in 1784, and went to live with his mother, in Hof; here he found a night's lodging, at least free of cost, and here he could go about without being pointed to as a beast broken loose from a menagerie, when he walked the streets without a wig, with open breast, and no neck-tie. In this respect, the people of Hof were more tolerant than a certain Leipzig magister, who—probably not remembering how the cynic Diogenes, in tattered garb, had trodden the pride of Plato under foot—had written to the wigless and collarless youth in peremptory terms, demanding the immediate discontinuance of the public nuisance.

A student has to accommodate himself to his needy circumstances as well as he can. 'Nowhere,' as we read in Richter's own day-book, 'does one collect poverty's siege-coins more merrily and philosophically than at the university. The academic citizen proves how many humorists and cynics Germany contains.' But it is doubly painful when the man of mature age has to pass year after year enduring the same, or it may be even greater hardships; of this, Jean Paul had a torturing experience after his settlement at Hof. On the posts of his doors he wrote in large characters: 'Dear Christian friends, you perceive that I have not much money, what inference do you draw from it?' On passing the door, one entered a narrow chamber, at the window, sitting on a wooden stool, was our hero, thinking and labouring; the rest of the apartment was occupied with the washing his mother had taken in. At another time, the mother is seen busily plying her distaff. An account of what mother and son earned in this way was carefully kept; a little account-book, relating 'how much we gained by spinning,' has been preserved. According to this, the receipts of the family, in March 1796, amounted to 2 florins, 51 kreutzers,

3 pence; in April, to 4 florins, 2 kreutzers; in May, to 4 florins, 9 kreutzers, 2 pf., &c., &c. Against the entry of 2 florins, 1 kreutzer, the sum received in September 1794, it is observed that, on the 9th of this same month of September, a new pair of boots was purchased for the youngest son Samuel, 'which cost 3 thalers, about the whole quarter's income.'

A writer will be pardoned for anything but tediousness. I fear I shall become tedious, or shall weary the patience of the reader, if I devote one page to tell how the tears of Richter's mother fell down upon her web or into her wash-tub—how affliction and silent grief preyed upon the heart of the aging woman like a gnawing worm, as her first-born son, whose laborious industry she watched, began to sicken; the lion who fought with royal courage became a lamb; her son had discontinued his usual and regular walks, his pleasure in life seemed to be extinguished, and the mirthful sally with which he used to deal out consolation was silent; the gentry of Hof affirmed that he was half-crazy, and the judgment was rapidly and universally endorsed.

His quietness, however, which pained his mother, was not an unstringing of his spirits or the submissiveness of despair, nor was his resignation the coldness of apathy; he had made a bargain with the longings of his heart, had made his peace with the world. Agony has ceased to make him complain. 'There is not a case in which I have not deserved my affliction. Every unpleasant sensation is an indication that I am untrue to my resolutions. Epictetus was not unhappy.' What does it matter to him what may be the opinions of his worship the mayor, or of his reverence the parson? 'Men for the most part judge very pitifully; why are you so anxious for the praise of children or of fools? No man honours you in a beggar's coat; be not therefore proud of the respect that is shown to your clothes.' How just! We to the man who has no appeal from the judgment of the world! he is a lost man! 'Let one,' as a certain critic remarks, 'observe the public in a theatre: the life of a man is here compressed within a period of three hours; it is played upon the open stage with brilliant lights and with all the appliances that human art and oratory can suggest to render it clear and simple, and still, after the curtain falls, how diversified are the opinions the public pass upon both the hero and the play.' But now let it be supposed that the drama is not concluded in three hours, but that it lasts during a man's whole lifetime, that it is not represented with any effort towards clearness, that upon many episodes no streams of daylight fall, and that we have no clue to many situations, no motive for many actions; and that the world or the critical public during the representation is occupied in diverse ways, bestowing its attention for a moment now here, and now there. Where is the wonder, then, if that world condemn where the drama cannot be reviewed according to the common gauge of the three Aristotelian unities, but must be measured by its own particular rules—or, metaphor aside, when the object of criticism is a man of original genius and character?

The soul of the Doric hero rose all the clearer, and more unconquerable from the depth of its sorrows and oppressions, its humiliation and deprivations, after the twelve labours. The angry goddess is appeased; an Æta commences the apotheosis of the son of the gods. For Jean Paul, also, the hour strikes when the inexorable forces of destiny at length cry 'Hold!' In the year 1798, the startling story of *Desiree* issued from the little washing and spinning chamber: it obtained for its author, in all the states of Germany, that for which he had laboured—recognition. 'What a god-genius,' writes the octogenarian Gleim, 'is our Friedrich Richter! Here is more than Shakespeare, I say to myself, in more than fifty passages I have

underlined. I am perfectly enraptured at the genius from which these streams, these rills, these Rhine-falls, these Blandusian springs issue and irrigate humanity, and if I am displeased to-day at some sentences such as the muses have not inspired, or even with the plan itself, I shall not be so to-morrow.'

The fight for existence and recognition is fought out; sunlight breaks through the clouds; henceforth the star of Jean Paul shines brightly in the heavens.

YOUNG BENGAL.

Amidst all the shortcomings of our western civilisation in British India, but more especially in Bengal—amidst all our disappointments, and our regrets at the barren crop of results from the labours of a century, we may point to one small section of the native community, who, if they be not with us, are certainly not against us: we allude to 'Young Bengal.' Readers who have heard of 'Young England,' of 'Young France,' and other juvenile embodiments of national movements, will at once perceive who are intended by the term Young Bengal; though they may hitherto have been in complete ignorance of the existence of such a class of persons in this part of British India.

Amongst the natives of Hindostan, whether Hindoo or Mussulman, we find men of all ages who are advanced in their ideas, who have imbibed certain notions more or less tinged by civilisation, who possess a certain taste for European things. There are many rajahs of Bengal who ape European life and habits, who are driven by English coachmen, furnish their mansions in English style, read English books and newspapers, and seek English society. The rajah of Bithoor, the Nena Sahib of infamous notoriety, was one of this class of men. Civilisation had indeed reached him, but it had come too late; it had exerted no softening influence on his heart or his mind: he was the same fanatical, bigoted Mussulman as ever. Civilisation had not even taught him worldly wisdom, or he must have felt how unequal, how hopeless the contest with British power.

Such as these are not comprised in the term Young Bengal. The class of Hindoos we allude to, though perhaps not of more promise to a superficial observer than such as the above, are, in our opinion, the men who shall hereafter do much for India; men who cannot stand still, who must progress, even though not in the true path. This class of young men is by no means small, nor contemptible; and though they have as yet made but small demonstration, though they must be sought for if to be found, it is beyond a doubt not an unimportant part they will enact at no distant day.

Whence come they? Of what class are they? They have sprung from the class-rooms of the government colleges. They are of no particular caste, or class, or section of native society; amongst them may be found the sons of rajahs, of zemindars, of baboos, of shroffs, of brokers and traders. But this one fact must be borne in mind—they are all descended from the *Brahminical* race. Not one Mussulman, not a single follower of the Prophet of Mecca is to be found in their ranks. Those stiff-necked, stubborn disciples of the Koran remain as they were a thousand years ago, and as they will be found a thousand years hence. They never change or progress; they are neither softened nor civilised; they have still the

same undying hate for every 'dog of a Christian,' for every unbelieving Feringhee, as of old; and though they may seldom find it convenient or prudent to make manifestation of their true feelings, we must not the less be on our guard against these fanatics, who deem it a matter of high and holy merit to murder an unbeliever. There are scores, nay, hundreds of such men as these who have gained much learning at the government expense, who are tolerably deep-read in much of our literature, and to some extent in science; but all this is coveted merely as a means of obtaining employment in official positions. In this they have been wondrously successful, and the Indian executive have for a long time past omitted no opportunity of promoting these fluent plausible Mohammedans even to the exclusion of Christians. Well, the government have sown the storm, and they have reaped the whirlwind. The foremost men in the present murderous rebellion are Mohammedans. Every Mussulman official in Upper Bengal and in the North-west Provinces has turned against us, has obeyed the dictates of his faith, and drawn his sword upon us 'dogs of unbelievers.' We shall look in vain amongst this class of men for one to join the swelling ranks of Young Bengal.

The government of the East India Company found themselves assailed, some time since, for sluggishness in the cause of education. They resolved that the reproach should no longer attach to them, and accordingly an order went forth for large grants for educational purposes. Colleges were built, philosophical 'chairs' were established, professors with strange names and huge beards were imported, highly paid inspectors were appointed, and annual reports drawn up and placed in type for England's satisfaction; and the cry is now: 'See what we have done!' Well, they have at least succeeded in rearing Young Bengal; but beyond that one first result, it is hard to lay one's hand upon any perceptible effect upon the vast masses of the people of India. The bulk of the population, indeed, has not been reached; we, and our schools, and our books, are as much strangers to them as we were fifty years since.

But what of Young Bengal? The government colleges and their professors have between them wrought a great change in the thoughts and dispositions, and even in the career of most of the young students. At a cost of about eighty or ninety pounds sterling per annum for each pupil, the Company has managed to instil large quantities of classical and British literature into the minds of the Hindoo scholars. An acquaintance with pure science has been less general, very many young lads contenting themselves with a knowledge of general literature, devouring with much zest Shakspeare, Milton, Byron, Moore, and our long range of prose writers, from Dr Johnson to Douglas Jerrold. Anything more solid than this they appear to have systematically eschewed as indigestible food. They were content to catch ideas, to be able to quote freely high-sounding sentences, without any practical application.

The peculiar qualities of the Bengalee mind—its elasticity, its pliability, its susceptibility—fitted it especially for the reception of theories, for the appreciation of poetical adornments; and thus at the end of a student's career in the chief Calcutta college, he came out in no way fitted for an active career,

in no way prepared to become a useful member of society, even as so-called society there exists, but replete with much to render him discontented, and too frequently unhappy.

Nothing could possibly exceed the magnificence and extent of the government educational establishments in Calcutta for rearing Hindoo atheists. The ease, the comfort, the luxury of the spacious apartments and halls of these 'godless colleges,' cannot by any means be excelled. The audience-chamber of the ancient Mogul kings of Delhi, the spacious courts of the old Assyrian palaces, the dwelling-places of Belus and Nimrod, the amphitheatres of Athens and Rome, were not more noble than the great halls and lecture-rooms of the City of Palaces. There, in those cold shady recesses, far removed from the glare, the dust, and the scorching heat of a Bengal day in September, the young rajahs and incipient baboons reclined beneath grateful punkahs, upon soft inviting cushions, listening with half-closed ears, with drowsy eyes and nodding head, to the oft-repeated verses, the well-conned chapter, but too glad when the hour approached for their departure, when the evening drive and the nightly carouse came to wind up the daily routine of their listless student-life.

Young Bengal is not so very young but that he has a wife. In India, however, marriages take place at about the age at which in England young gentlemen would be breeched; and young Hindoo ladies are not unfrequently betrothed immediately after cutting their last teeth, so that it does not amount to much to say that all our college students of the first and second classes are married. Most of them drive to college in carriages that would not discredit Hyde Park; some few drawn by valuable 'pairs'; but some also borne along by the real Hindoo hack, all bone and skin, whilst tattered red curtains are fluttering wildly from the windows. With this singular race, there is but one step from the magnificent to the mean, from the princely to the paltry. They recognise nothing like respectability; they know nothing but the extremes of luxury and dirt.

We have said that these young students—the hope of their country—are married; and in this we at once find one certain evil result of their own highly finished half-education. Cultivated as their tastes may be far above the old-caste prejudices of their race, these men have all married women utterly unlettered; for to this time, education is all but unknown amongst the females of the higher classes of natives; it has made some way amongst lower castes, but there it has remained. So long accustomed to the highly seasoned intellectual food of the colleges, Young Bengal turns with indifference, if not with disgust, from her who should be his best and constant companion and helpmate, to find the solace, the wit, the thought, the knowledge of passing events in some less legitimate acquaintance—in one who has made it her study to minister to the vitiated tastes of the frequenters of the gay mansions in Durrumtollah and the Circular Road. The wife who was good enough for one of this class of Hindoos before education lifted him from his former place in native society, is no longer to be tolerated; hence a wide schism in the houses of the race, where the evenings and the nights of Young Bengal are but too seldom passed.

It is not difficult to ascertain the creed of this school of Hindoos. Amongst their own families and friends, they are still disciples of Brahma and Vishnu. The Rhat Jatra, the Doorga Poojah, and other great Hindoo festivals, find them foremost in the ranks of devotees; they are still the same faithful, constant attendants at the temples of their forefathers. But question them on their belief in the scenes and ceremonies they are taking a part

in, and they will not hesitate to tell you how completely they despise the old creed of Siva and Vishnu; how thoroughly their European studies have taught them the folly and absurdity of faith in any such vain religion; and that they attend the Hindoo festivals merely to please their mothers or their wives.

No member of the fraternity of Young Bengal has yet found courage to speak out boldly before the world and tell their unbelief. They shrink from the consequences; they dare not take a step which, whilst it would assuredly entail upon them the anathemas of their families, and banishment from all Hindoo society, would at the same time procure them no admission within European circles. In British India, the line of demarcation between white and black, between European and Asiatic, has been so unmistakably drawn, so rigidly enforced, as to be impassable. There is something, however, more fatal even than colour or caste tending to exclude Young Bengal from any sympathy from Europeans: it is their scepticism. With but very few exceptions, these young men are atheists, and to us openly, avowedly so. The teachings of the government professors have indeed destroyed the old superstitions of the land, but they have failed in replacing them with anything more worthy of belief. They have learned so thoroughly to despise the ancient creed of their ancestors, that knowing nothing of the one living faith, they have flung themselves into the arms of unbelief, swearing by the words of Voltaire and Tom Paine.

No Epicureans of the ancients ever revolved in more enervating luxury and voluptuous ease and idleness than the upper ranks of Young Bengal. Their private life reads like the chronicles of Nineveh, the diary of some imperial Roman. The early indolence of the morning; the late and costly breakfast; the mid-day bath; the lounging on soft couches, and listening to melodious poetry; the evening drive; the lamp-lit meal, the music and gay female company, the late wine-cup and midnight song—such is but a faint though truthful picture of the everyday life of Young Bengal.

But let us not forget to except some few more honourable men than such as these. We can count up half a score of names of Hindoos who, amidst all their learning, have not run wild, nor rushed into vicious excesses, who ply their pens, and though not as rightly so as we could wish to see, still use them honestly and vigorously. One of the most able weekly journals of Calcutta is not only conducted, but written throughout by a young Hindoo pupil of the government college. The articles from his pen, though sometimes errant, are, on the whole, able and instructive. He is a Brahmin of high family, and has to this time remained true to his family faith.

It is impossible not to regard this enlarging class of young men with interest. It remains to be seen what their children will become, and whether, feeling their own want of sympathy from uneducated wives, they will have courage to give their daughters instruction not less than their sons. This is already happening in some few instances; let us hope the example may be widely followed; and from that time may be dated a new and brighter era for British India. None care they who have dwelt in the far east, and who have known the Hindoo in his home, can say truly how servile and debased is the career of such a man's wife. Her mind left a barren waste without one single elevating or generous principle, what can be expected from her, and what can be hoped from the rising generation intrusted to her care for so many long years!

The great work of enlightenment, of Christianising, must be done through the wives and daughters of

Young Bengal. Once admit the light of day into the private chambers of the Hindoos, and we shall quickly behold a wondrous change. Until that can be done, we but labour in vain—we do but as yet sow the seeds of unbelief, of domestic discord and unhappiness.

DIPSOMANIA.

In the progress of events, new scientific terms are continually making their appearance; the last is perhaps Dipsomania—a craving for intoxicating liquors which partakes of the character of insanity; the term being compounded of the Greek words for *thirst* and *madness*. Whether thirst, in the usual meaning of the word, has anything to do with the maddened propensity for drinking, is of no consequence. The name now given to the disease will do as well as any other; and under whatever phraseology, we are glad to find that the medical world is at length concerning itself with one of the most distressing forms of mental derangement.

Tipplers, hard-drinkers, men who go off on a drunken ramble, as it is called, for days or weeks, are nothing singular. We have all seen or heard of such persons—an annoyance they are to society, a discredit to themselves. These, however, are not dipsomaniacs. Applying to the subject the nomenclature of natural history, the genus drinker consists of two species—he who, with intervals of common-sense, relieved at worst with short fits of delirium, still puts a good face on affairs, and conducts himself on the whole pretty fairly; and he who, by a peculiar condition of brain, sinks under a chronic and uncontrollable appetite for intoxicants: this last being the dipsomaniac proper. The law, which always drags heavily at the heels of general intelligence, has not yet been able to make any distinction in the drinking species; and accordingly, however far a man be gone in dipsomania, however confirmed in this kind of madness, and however incapable of thinking or acting correctly—in fact, if he should fall into ruin himself, and ruin all about him—still, legally, he is not insane; and in defiance of common sense, he goes at large, no magistrate being authorised to grant a warrant for his apprehension and confinement.

So very extraordinary a stretch of respect for 'the liberty of the subject' is beginning to attract attention. An improved knowledge of mental disease now makes it evident that the dipsomaniac is as completely an irresponsible being as he who is affected by other forms of lunacy. It may be that, in the first instance, he has brought his disease on himself; he has, perhaps, in that eager pursuit of business and desire to be rich, which is the scandal of the present age, greatly overtasked his brain—worked hard all day, mistimed his meals, sat up late, taken no outdoor exercise, kept his mind on the rack, and to sustain nature, resorted to stimulants. So much may be admitted: we may look on the victim as self-immolated; but what then? From whatever cause men become maniacs, it is surely the duty of society to see that they are restrained from committing grievous wrong, and subjected to a humane and remedial mode of treatment.

A perusal of the lately issued pamphlet of Dr Alexander Peddie of Edinburgh,* ought to remove any doubts which may be entertained respecting the actual nature of the drinking insanity. Speaking of the diseased state of the dipsomaniac, this writer observes: 'I consider that his condition is strictly one of combined moral and mental insanity, and the consequence of a vicious impulsive propensity—for I cannot in such a case denominate it simply as a vice;

and I regard it as rendering him incapable of the exercise of social duties and civil rights; and not merely so, but as lessening and altering the nature of his culpability in reference to crime, and thereby his liability to punishment of the same kind, or to the same extent, as the other members of the community. That the excessive uncontrollable desire for intoxicating drinks is a disease, and that it is symptomatic of some abnormal cerebral condition which gives it the character of a form of insanity, cannot be doubted; and it should be always kept in mind that this condition is not so much produced by intoxicating drinks, as it is by that which created the desire for them.' As to the manifestation of insanity, it may be 'addictedness to drinks, as well as to hallucination of ideas. To declare whether it is so, or not, is as much a question for medical skill in the former case as in the latter. But medical observation has declared that dipsomania is a physical proof of mental disorganisation, and therefore it appears to me that such cases stand exactly on the same footing as other forms of insanity; and that, as it never has been questioned that government may deal with insanity, it seems to be equally within its province to deal with dipsomania. Surely, viewed in the light of common sense, and sifted and scrutinised by the strictest rules of induction, the confirmed dipsomaniac ought to be regarded as of "unsound mind," or, as I would rather call it, "diseased mind," *non compos mentis*, and should be taken care of for his own sake, for the welfare of his family, and for the good of society.'

The remarkable thing about the dipsomaniac is his want of power to restrain himself. With certain faculties still active, he knows that he ought not to drink, yet he cannot help drinking. In medical language, the crave is upon him. 'The main desire of his life is how to obtain liquor; his capacity for business is confined to the means of gratifying his leading desire; moral control has lost its sway over him; he has no power to resist the propensity whenever gratification is within his reach; he has, in fact, become the involuntary slave of the vice, and would sacrifice his last sixpence or his shirt, or sell his soul to the devil, for one drop more, rather than be disappointed. Yet, strange to say, the poor creature, in this condition, has no pleasure in drinking. He takes it, not sippingly and with gusto, enjoying it as the *bon vivant* does, socially or convivially, but gulps it down in large quantities, away from society and observation, and even as it were a drug; and the only satisfaction derived from the act is, that it secures blunted feeling, insensibility to the wretched state of mind which prompts the desire, and an escape from the fancied miseries of his existence. When this has gone on for some time, although a suspension of the use of stimulants be imposed by the interference of friends, or by the occurrence of an attack of either of the two resulting forms of delirium, yet his mind has suffered so materially, that, unless continued control be exercised over him, and this for a very considerable time—which is not often practicable in the present usages of society, and is contrary, as I have shewn, to the common law of the land—he returns immediately like the dog "to his vomit, and like the sow that was washed to her wallowing in the mire;" and his progress towards some incurable form of insanity, or to an early death from some other superinduced disease, is certain. His moral faculties become more and more diseased, his intellectual powers weakened, disturbed, or at last even annihilated. He becomes either facile or wasteful, or incapacitated for transacting the ordinary business of life, or he is mischievous, and commits homicide or suicide; these various results being induced according as his natural disposition and passions may urge, or his hereditary predisposition may incline, or some previous injury of the head or

* *The Necessity for some Legalised Arrangements for the Treatment of Dipsomania.* By Alexander Peddie, M.D. 1868.

disease of the brain may precipitate him. That such, more or less, is the condition of the dipsomaniac, and that these consequences may, and do, frequently result, cannot be disputed. And yet, because the unhappy victim of this disease does not fall strictly under the present legal definition of unsoundness in mind, he is permitted to go at liberty; any interference in the shape of control is illegal, and his nearest and best friends, and he himself, are deprived of the only means by which his cure could be effected, and his restoration as a useful member of society accomplished. He is thus permitted, without any barrier being placed, or allowed to be placed, in the way, to hurry himself on to ruin, reducing his own family, it may be, to beggary, perhaps even to disgrace, and at last to accomplish his own sad death, or be convicted and punished for some criminal act committed in an hour of intoxicated madness, for which he is nevertheless held responsible in the eye of the law. In the latter case, indeed, the total neglect of the law to provide for this humiliating disease, is well illustrated by its viewing that very circumstance, which had deprived the criminal of self-control, to be, not a palliation, but an aggravation of his guilt.

The remedy proposed for this deliberate injustice and inhumanity, is the establishment of asylums, distinct altogether from those for ordinary lunatics, to which, by medical certificates under proper authority, the unfortunate class of dipsomaniacs may be consigned. It is believed that in a variety of instances, a short retirement would have the effect of so restoring a healthy state of brain that the maniacal appetite for liquor would disappear, and the patient be either sent home effectually cured to his friends, or allowed to assume the management of his affairs within the limits of the asylum. When the public mind is more fully awakened to the benefits of this mode of treatment, we may expect that legislation will be brought to bear on the subject.

OCEOLA:

A ROMANCE.

CHAPTER XLIV.—AN ECLAIRCISSEMENT.

THUS were the shadows upon the water promised by Haj-Ewa—black shadows upon my heart.

Mad queen of the Micoosau! what have I done to deserve this torture? Thou too my enemy! Had I been thy deadliest foe, thou couldst scarcely have contrived a keener sting for thy vengeance.

Face to face stood Maimee and her lover—seduced and seducer. I had no doubt as to the identity of either. The moonbeam fell upon both—no longer with soft silvery light, but gleaming rude and red, like the chandeliers of a bagnio. It may have been but a seeming—the reflection of an inflamed imagination that influenced me from within; but my belief in her innocence was gone—hopelessly gone; the very air seemed tainted with her guilt—the world appeared a chaos of debauchery and ruin.

I had no other thought than that I was present at a scene of assassination. How could I think otherwise? No signs of surprise were exhibited by either, as they came together. They met as those who have promised to come—who have often met before.

Evidently each expected the other. Though other emotions declared themselves, there was not the slightest sign of novelty in the encounter.

For me, it was a terrible crisis. The anguish of a whole life compressed into the space of a single moment could not have been more unendurable. The blood seemed to scald my heart as it gashed through. So acute was the pang, I could scarcely restrain myself from crying aloud.

An effort—a stern determined effort—and the throes were over. Firmly bracing my nerves—firmly grasping the branches—I clung to my seat, resolved to know more.

That was a fortunate resolution. Had I at that moment given way to the wild impulses of passion, and sought a reckless revenge, I should in all likelihood have carved out for myself a long lifetime of sorrow. Patience proved my guardian angel, and the end was otherwise.

Not a word—not a motion—not a breath. What will they say?—what do?

My situation was like his of the suspended sword. On second thoughts, the smile is both trite and untrue: the sword had already fallen; it could wound me no more. I was as one paralyzed both in body and soul—impervious to further pain.

Not a word—not a motion—not a breath. What will they say?—what do?

The light is full upon Maimee; I can see her from head to foot. How large she has grown—a woman in all her outlines, perfect, entire. And her levelness has kept pace with her growth. Larger, she is lovelier than ever. Demon of jealousy! art thou not content with what thou hast already done? Have I not suffered enough? Why hast thou presented her in such witching guise? O that she were scarred, hideous, hag-like—as she shall yet become! Even thus to see her, would be some satisfaction—an anodyne to my chafed soul.

But it is not so. Her face is sweetly beautiful—never so beautiful before. Soft and innocent as ever—not a line of guilt can be traced on those placid features—not a gleam of evil in that round, rolling eye! The angels of heaven are beautiful; but they are good. Oh, who could believe in crime concealed under such loveliness as hers?

I expected a more meretricious mien. There was a scintillation of cheer in the disappointment.

Do not suppose that these reflections occupied time. In a few seconds they passed through my mind, for thought is quicker than the magnetic shock. They passed while I was waiting to hear the first words that, to my surprise, were for some moments unspoken. To my surprise: I could not have met her in such fashion. My heart would have been upon my tongue, and my lips—

I see it now. The hot burst of passion is past—the spring-tide of love has subsided—such an interview is no longer a novelty—perhaps he grows tired of her, foul liberties that he is! See! they meet with some shyness. Coldness has arisen between them—a love quarrel—fool is he as villain—fool not to rush into those arms, and at once reconcile it. Would that his opportunities were mine!—not all the world could restrain me from seeking that sweet embrace.

Bitter as were my thoughts, they were less bitter on observing this attitude of the lovers. I fancied it was half-hostile.

Not a word—not a motion—not a breath. What will they say?—what do?

My suspense came to an end. The *aid-de-camp* at length found his tongue.

'Lovely Maimee! you have kept your promise.'

'But you, sir, have not yours? No—I read it in your looks. You have yet done nothing for us!'

'Be assured, Maimee, I have not had an opportunity. The general has been so busy, I have had no chance to press the matter upon him. But do not be impatient. I shall be certain to persuade him, and your property shall be restored to you in due time. Tell your mother not to feel uneasy: for your sake, beautiful Maimee, I shall spare no exertion. Believe me, I am as anxious as yourself; but you must know the stern disposition of my uncle; and,

moreover, that he is on the most friendly terms with the Ringgold family. In this will lie the main difficulty, but I fear not that I shall be able to surmount it.'

'O, sir, your words are fine, but they have little worth with us now. We have waited long upon your promise to befriend us. We only wished for an investigation; and you might easily have obtained it ere this. We no longer care for our lands, for greater wrongs make us forget the less. I should not have been here to-night, had we not been in sad grief at the misfortune—I should rather say outrage—that has fallen upon my poor brother. You have professed friendship to our family. I come to seek it now, for now may you give proof of it. Obtain my brother's freedom, and we shall then believe in the fair words you have so often spoken. Do not say it is impossible; it cannot even be difficult for you who hold so much authority among the white chiefs. My brother may have been rude; but he has committed no crime that should entail severe punishment. A word to the great war-chief, and he would be set free. Go, then, and speak that word.'

'Lovely Mañmee! you do not know the nature of the errand upon which you would send me. Your brother is a prisoner by orders of the agent, and by the act of the commander-in-chief. It is not with us as among your people. I am only a subordinate in rank, and were I to offer the counsel you propose, I should be rebuked—perhaps punished.'

'Oh, you fear rebuke for doing an act of justice?—to say nought of your much-offered friendship? Good, sir! I have no more to say, except this—we believe you no longer. You need come to our humble cabin no more.'

She was turning away with a scornful smile. How beautiful seemed that scorn!

'Stay, Mañmee!—fair Mañmee, do not part from me thus—doubt not that I will do all in my power'—

'Do what I have asked you. Set my brother free—let him return to his home.'

'And if I should'—

'Well, sir.'

'Know, Mañmee, that for me to do so would be to risk everything. I might be degraded from my rank—reduced to the condition of a common soldier—disgraced in the eyes of my country—ay, punished, perhaps, by imprisonment worse than that which your brother is likely to endure. All this would I risk by the act.'

The girl paused in her step, but made no reply.

'And yet all these chances shall I undergo—ay, the danger of death itself—if you, fair Mañmee—here the speaker waxed passionate and insinuating—'if you will only consent.'

'Consent—to what, sir?'

'Lovely Mañmee, need I tell you? Surely you understand my meaning? You cannot be blind to the love—to the passion—to the deep devotion with which your beauty has inspired me'—

'Consent to what, sir?' demanded she, repeating her former words, and in a soft tone, that seemed to promise compliance.

'Only to love me, fair Mañmee—to become my mistress.'

For some moments, there was no reply. The grand woman seemed immobile as a statue. She did not even start on hearing the foul proposal, but, on the contrary, stood as if turned to stone.

Her silence had an encouraging effect upon the ardent lover; he appeared to take it for assent. He could not have looked into her eye, or he would there have read an expression that would have hindered him from pressing his suit further. No—he could not have observed that glance, or he would hardly have made such a mistake.

'Only promise it, fair Mañmee; your brother shall be free before the morning, and you shall have everything'—

'Villain, villain, villain! Ha, ha, ha, ha! Ha, ha, ha, ha, ha!'

In all my life, I never heard aught so delightful as that laugh. It was the sweetest sound that ever fell upon my ears. Not all the wedding-bells that ever rang—not all the lutes that ever played—not all the harps and hautboys—the clarions and trumpets—in the world, could have produced such melodious music for me.

The moon seemed to pour silver from the sky—the stars had grown bigger and brighter—the breeze became filled with delicious odours, as if a perfumed censer had been spilled from heaven, and the whole scene appeared suddenly transformed into an Elysium.

CHAPTER XLV.

TWO DUELS IN ONE DAY.

The crisis might have been my cue to come down; but I was overpowered with a sense of delightful happiness, and could not stir from my seat. The arrow had been drawn out of my breast, leaving not a taint of its poison—the blood coursed pleasantly through my veins—my pulse throbbed firm and free—my soul was triumphant. I could have cried out for very joy.

With an effort, I held my peace, and waited for the *dénouement*—for I saw that the scene was not yet at an end.

'Mistress, indeed!' exclaimed the bold beauty in scornful accent. 'And this is the motive of your proffered friendship. Vile wretch! for what do you mistake me? a camp-wench, or a facile squaw of the Yemassee? Know, sir, that I am your equal in blood and race; and though your pale-faced friends have robbed me of my inheritance, there is that which neither they nor you can take from me—the honour of my name. Mistress, indeed! Silly fellow! No—not even your wife. Sooner than sell myself to such base love as yours, I should wander naked through the wild woods, and live upon the scorn of the oak. Rather than redeem him at such a price, my brave brother would spend a lifetime in your chains. Oh, that he were here! Oh, that he were witness of this foul insult! Wretch! he would smite thee like a reed to the earth.'

The eye, the attitude, the foot firmly planted, the fearless determined bearing—all reminded me of Oçoola while delivering himself before the council. Mañmee was undoubtedly his sister.

The *soi-disant* lover quailed before the withering reproach, and for some time stood shrinking and abashed.

He had more than one cause for abasement. He might feel regret at having made a proposal so ill received; but far more at the disappointment of his hopes, and the utter discomfiture of his designs.

Perhaps, the moment before, he would have smothered his chagrin, and permitted the girl to depart without molestation; but the scornful apostrophe had roused him to a sort of frenzied recklessness; and probably it was only at that moment that he formed the resolve to carry his rudeness still further, and effect his purpose by force.

I could not think that he had held such design, anterior to his coming on the ground. Professed libertine though he was, he was not the man for such perilous emprise. He was but a speck of vain conceit, and lacked the reckless daring of the raviager. It was only when stung by the reproaches of the Indian maiden, that he resolved upon proceeding to extremes.

She had turned her back upon him, and was moving away.

'Not so fast!' cried he, rushing after, and grasping her by the wrist; 'not so fast, my brown-skinned charmer! Do not think you can cast me so lightly. I have followed you for months, and, by the god Phœbus, I shall make you pay for the false smiles you have treated me to. You needn't struggle; we are alone here; and ere we part, I shall'—

I heard no more of this hurried speech—I had risen from my perch, and was hurrying down to the rescue; but before I could reach the spot, another was before me.

Haj-Ewa—her eyes glaring fiercely—with a wild maniac laugh upon her lips—was rushing forward. She held the body of the rattlesnake in her extended hands, its head projected in front, while its long neck was oscillating from side to side, shewing that the reptile was angry, and eager to make an attack. Its hiss, and the harsh 'skirr-rr' of its rattles could be heard sounding at intervals as it was carried forward.

In another instant, the maniac was face to face with the would-be ravisher—who, startled by her approach, had released his hold of the girl, and falling back a pace, stood gazing with amazement at this singular intruder.

'Ho, ho!' screamed the maniac, as she glided up to the spot. 'His son, his son! Ho! I am sure of it, just like his false father—just as he on the day he wronged the trusting Ewa. *Hulwak!* It is the hour—the very hour—the moon in the same quarter, horned and wicked—smiling upon the guilt. Ho, ho! the hour of the deed—the hour of vengeance! The father's crime shall be atoned by the son. Great Spirit! give me revenge! *Chitta mico!* give me revenge!'—

As she uttered these apostrophic appeals, she sprang forward, holding the snake far outstretched—as if to give it the opportunity of striking the now terrified man.

The latter mechanically drew his sword, and then, as if inspired by the necessity of defending himself, cried out:

'Hellish sorceress! if you come a step nearer, I shall run you through the body. Back, now! Keep off, or, by —, I shall do it!'—

The resolution expressed by his tone proved that the speaker was in earnest; but the appeal was unheeded. The maniac continued to advance despite the shining blade that menaced her, and within reach of whose point she had already arrived.

I was now close to the spot; I had drawn my own blade, and was hurrying forward to ward off the fatal blow which I expected every moment would be struck. It was my design to save Haj-Ewa, who seemed recklessly rushing upon her destruction.

In all probability, I should have been too late, had the thrust been given; but it was not.

Whether from terror at the wild unearthly aspect of his assailants, or, what is more likely, fearing that she was about to fling the snake upon him, the man appeared struck with a sudden panic, and retreated backward.

A step or two brought him to the edge of the water. There were loose stones strewed thickly along the shore; among these his feet became entangled; and, balancing backward, he fell with a splash upon the pond!

The water deepened abruptly, and he sank out of sight. Perhaps the sudden immersion was the means of saving his life; but the moment after, he rose above the surface, and clambered hastily up on the bank.

He was now furious, and with his drawn sword, which he had managed to retain hold of, he rushed

towards the spot where Haj-Ewa still stood. His angry oaths told his determination to slay her.

It was not the soft yielding body of a woman, nor yet of a reptile, that his blade was to encounter. It struck against steel, hard and shining as his own.

I had thrown myself between him and his victim, and had succeeded in restraining Haj-Ewa from carrying out her vengeful design. As the assailant approached, his rage, but more, the water half-blinding him, hindered him from seeing me; and it was not till our blades rasped together, that he seemed aware of my presence.

There was a momentary pause, accompanied by silence.

'You, Randolph!' at length he exclaimed in a tone of surprise.

'Ay, Lieutenant Scott—Randolph it is. Pardon my intrusion, but your pretty love-scene changing so suddenly to a quarrel, I deemed it my duty to interfere.'

'You have been listening?—you have heard?—and pray, sir, what business have you either to play the spy on my actions, or interfere in my affairs?'

'Business—right—duty—the duty which all men have to protect weak innocence from the designs of such a terrible Blue Beard as you appear to be.'

'By —, you shall rue this.'

'Now?—or when?'

'Whenever you please.'

'No time like the present. Come on!'

Not another word was spoken between us; but, the instant after, our blades were clinking in the fierce game of thrust and parry.

The affair was short. At the third or fourth lunge, I ran my antagonist through the right shoulder, disabling his arm. His sword fell jingling among the pebbles.

'You have wounded me!' cried he; 'I am disarmed,' he added, pointing to the fallen blade. 'Enough, sir; I am satisfied.'

'But not I—until you have knelt upon these stones, and asked pardon from her whom you have so grossly insulted.'

'Never!' cried he; 'never!'—and as he uttered these words, giving, as I presumed, a proof of determined courage, he turned suddenly; and, to my utter astonishment, commenced running away from the ground!

I ran after, and soon overtook him. I could have thrust him in the back, had I been sanguinarily inclined; but instead, I contented myself with giving him a foot-salute, in what Gallagher would have termed his 'postayriora,' and with no other adieu, left him to continue his shameful flight.

CHAPTER XLVI.

A SILENT DECLARATION.

'Now for the love, the sweet young love,
Under the *tala* tree,' &c.

It was the voice of Haj-Ewa, chanting one of her favourite melodies. Far sweeter the tones of another voice pronouncing my own name:

'George Randolph!'

'Maimee!'

'Ho, ho! you both remember?—still remember? *Hinklas!* The island—that fair island—fair to you, but dark in the memory of Haj-Ewa. *Hulwak!* I'll think of't no more—no, no, no!

Now for the love, the sweet young love,
Under —

It was once mine—it is now yours: yours, *mico!* yours, *haintchits!* Pretty creatures! enjoy it alone; you wish not the mad queen for a companion? Ha,

ha! *Cooree, cooree*. I go; fear not the rustling wind, fear not the whispering trees; none can approach while Haj-Ewa watches. She will be your guardian. *Chitta mico, too. Ho, chitta mico!*

Now for the love, the sweet young love;

and again renewing her chant, the strange woman glided from the spot, leaving me alone with Maimee.

The moment was not without embarrassment to me—perhaps to both of us. No profession had ever passed between us, no assurance, not a word of love. Although I loved Maimee with all my heart's strength, although I now felt certain that she loved me, there had been no mutual declaration of our passion. The situation was a peculiar one, and the tongue felt restraint.

But words would have been superfluous in that hour. There was an electricity passing between us—our souls were *en rapport*, our hearts in happy communion, and each understood the thoughts of the other. Not all the words in the world could have given me surer satisfaction that the heart of Maimee was mine.

It was scarcely possible that *she* could misconceive. With but slight variation, my thoughts were hers. In all likelihood, Haj-Ewa had carried to her ears my earnest declaration. Her look was joyful—assured. She did not doubt me.

I extended my arms, opening them widely. Nature prompted me, or perhaps passion—all the same. The silent signal was instantly understood, and the moment after, the head of my beloved was nestling upon my bosom.

Not a word was spoken. A low fond cry alone escaped her lips as she fell upon my breast, and twined her arms in rapturous compression around me.

For some moments we exchanged not speech; our hearts alone held converse.

Soon the embarrassment vanished, as a light cloud before the summer sun: not a trace of shyness remained; and we conversed in the confidence of mutual love.

I am spared the writing our love-speeches. You have yourself heard or uttered them. If too commonplace to be reported, so also are they too sacred. I forbear to detail them.

We had other thoughts to occupy us. After a while, the transport of our mutual joys, though still sweet, assumed a more sober tinge; and, half-forgetting the present, we talked of the past and the future.

I questioned Maimee much. Without guile, she gave me the history of that long interval of absence. She confessed, or rather declared—for there was no coquettish hesitation in her manner—that she had loved me from the first—even from that hour when I first saw and loved her: through the long silent years, by night as by day, had the one thought held possession of her bosom. In her simplicity, she wondered I had not known of it!

I reminded her that her love had never been declared. It was true, she said; but she had never dreamt of concealing it. She thought I might have perceived it. Her instincts were keener: she had been *conscious of mine!*

So declared she, with a freedom that put me off my guard. If not stronger, her passion was nobler than my own.

She had never doubted me during the years of separation. Only of late; but the cause of this doubt was explained: the pseudo-lover had poured poison into her ears. Hence the errand of Haj-Ewa.

Alas! my story was not so guileless. Only part of the truth could I reveal; and my conscience smote me as I passed over many an episode that would have given pain.

But the past was past, and could not be re-enacted. A more righteous future was opening before me; and silently in my heart did I register vows of atonement. Never more should I have cause to reproach myself—never would my love—never could it—wander away from the beautiful being I held in my embrace.

Proudly my bosom swelled as I listened to the ingenuous confession of her love, but sadly when other themes became the subject of our converse. The story of family trials, of wrongs endured, of insults put upon them—and more especially by their white neighbours, the Ringgolds—caused my blood to boil afresh.

The tale corresponded generally with what I had already learned; but there were other circumstances unknown to public rumour. He too—the wretched hypocrite—had *made love to her*. He had of late desisted from his importunities, through fear of her brother, and dared no longer come near.

The other, Scott, had made his approaches under the guise of friendship. He had learned, what was known to many, the position of affairs with regard to the Indian widow's plantation. From his relationship in high quarters, he possessed influence, and had promised to exert it in obtaining restitution. It was a mere pretence—a promise made without any intention of being kept; but, backed by fair words, it had deceived the generous trusting heart of Oçoola. Hence the admission of this heartless cur into the confidence of a family intimacy.

For months had the correspondence existed, though the opportunities were but occasional. During all this time had the *soi-disant* seducer been pressing his suit—though not very boldly, since he too dreaded the frown of that terrible brother—neither successfully: he had *not* succeeded.

Ringgold well knew this when he affirmed the contrary. His declaration had but one design—to sting me. For such purpose, it could not have been made in better time.

There was one thing I longed to know. Surely Maimee, with her keen quick perception, from the girlish confidence that had existed between them—surely she could inform me. I longed to know the relations that had existed between my sister and her brother.

Much as I desired the information, I refrained from asking it.

And yet we talked of both—of Virginia especially, for Maimee remembered my sister with affection, and made many inquiries in relation to her. Virginia was more beautiful than ever, she had heard, and accomplished beyond all others. She wondered if my sister would remember those walks and girlish amusements—those happy hours upon the island.

'Perhaps,' thought I, '*too well!*'

It was a theme that gave me pain.

The future claimed our attention; the past was now bright as heaven, but there were clouds in the sky of the future.

We talked of that nearest and darkest—the imprisonment of Oçoola. How long would it last? What could be done to render it as brief as possible?

I promised to do everything in my power; and I purposed as I promised. It was my firm resolve to leave no stone unturned to effect the liberation of the captive chief. If right should not prevail, I was determined to try stratagem. Even with the sacrifice of my commission—even though personal disgrace should await me—the risk of life itself—I resolved he should be free.

I needed not to add to my declaration the emphasis of an oath; I was believed without that. A flood of gratitude was beaming from those liquid orbs; and the silent pressure of love-burning lips was sweeter thanks than words could have uttered.

It was time for parting; the moon told the hour of midnight.

On the crest of the hill, like a bronze statue outlined against the pale sky, stood the mad queen. A signal brought her to our side; and after another embrace, one more fervid pressure of sweet lips, Madmee and I parted.

Her strange but faithful guardian led her away by some secret path, and I was left alone.

I could scarcely take myself away from that consecrated ground; and I remained for some minutes longer, giving full play to triumphant and rapturous reflections.

The declining moon again warned me; and, crossing the crest of the hill, I hastened back to the Fort.

THE MONTH:

SCIENCE AND ARTS.

Among the Friday-evening lectures which have been delivered at the Royal Institution, there is one especially worthy of notice. Those lectures, by the way, are more or less popular expositions of the progress of science, highly interesting to those who have the good-fortune to hear them; but the two in question are of the kind not easy to be followed by a general auditory. Neither can we do more here than make brief mention of them; but that will answer our purpose of recording the advances made by science. One on 'Molecular Impressions by Light and Electricity,' was by Mr Grove, who is well known as a philosophical savant of a high order; and it demonstrates that the science of molecular physics, though rich in results gained within the past fifty years, is yet richer in promise for the future. In the case of light and electricity, their effect on bodies with which they come in contact depends on the molecular structure of those bodies. 'Carbon, in the form of diamond, transmits light, but stops electricity. Carbon, in the form of coke or graphite, into which the diamond may be transformed by heat, transmits electricity, but stops light. All solid bodies (approximately speaking) which transmit light freely, or are transparent, are non-conductors of electricity, or may be said to be opaque to it; all the best conductors of electricity, as black carbon and the metals, are opaque or non-conductors of light.' Every one knows the effect of insolation, or exposure to the sun, on colours and on plants—one is bleached, the other becomes green, and Mr Grove thinks that had he given his lecture in the summer, he could have shown that it was really possible to extract sunbeams from cucumbers. The science of Laputa is therefore not all fallacious.

The old philosophers would have scouted the idea of the imponderables materially affecting the ponderables; but modern science finds reason to believe that all bodies are, in a greater or less degree, changed by the impact of light. Here a hygienic question comes into play, and an important one, looking at the registrar-general's bills of mortality, and the recently published report upon the health—or rather the neglect of it—of the army; and the means whereby barrack-life in England has been rendered more fatal than service in the field. Mr Grove says: 'The effect of light on the healthy growth of plants is well known; and it is generally believed that dark rooms, though well heated and ventilated, are more *closer* or

less healthy than those exposed to light. When we consider the invisible phosphorescence which must radiate from the walls and furniture—when we consider the effects of light on animal tissue, and the probable ozonizing or other minute chemical changes in the atmosphere effected by light, it becomes probable that it is far more immediately influential on the health of the animate world than is generally believed.'

Then, as regards electricity: gaseous atmospheres are changed by passing a current of electricity through them: letters cut from thin paper, placed between two sheets of electrified glass, leave an impression which becomes visible by breathing on them, or permanently fixed by exposure to the vapour of hydrofluoric acid: a proof that some molecular change is produced on the surface of the glass. In connection with these phenomena, Mr Grove suggests an important application of photography to astronomy, derived from the fact that, by means of the electric lamp, photographs of the moon may be made to give an image six feet in diameter, with details and lights remarkably distinct. Observers, even with the best instruments, are always baffled in making out the minute features of a distinct object for want of sufficient light. Mr Grove's suggestion is, that if a photograph of the object were taken, and illuminated indefinitely by adventitious light, the image might then be examined microscopically. 'In other words, is the photographic eye more sensitive than the living eye, or can a photographic recipient be found which will register impressions which the living eye does not detect, but which, by increased light or by developing agents, may be rendered visible to the living eye?' There is something highly suggestive in all this; it creates quite a new world of thoughts concerning the operations of nature.

Mr Lassell is finishing a forty-feet reflecting telescope, which he intends to take to Malta, and then devote himself to three or four years' observations of the nebulae. He has already explored the sky from that island with a twenty-feet reflector, and to good purpose; but we shall hear of yet greater achievements with the forty feet. As for little planets, they will soon become a drug in the astronomical market: the number is now fifty-two; and no sooner are they noted, than their orbits are calculated, and their movements accurately determined; and yet a certain rector in Saxony declares the Copernican system to be false, and maintains that the earth does not move round the sun.

There is something to record of photography which can hardly be described as otherwise than wonderful. It is a discovery made by that skilful pioneer of photographic art, Niepce de St Victor, some four or five months ago, and now that there is no room to doubt, we give an outline of it. Mr Grove mentioned it in his lecture, as a striking example of the effect of light. Marvellous as it may appear, light can actually be bottled up for use. Take an engraving which has been kept for some days in the dark; expose it to full sunshine—that is, insolate it—for fifteen minutes; lay it on sensitive paper in a dark place, and at the end of twenty-four hours, it will have left an impression of itself on the sensitive paper; the whites coming out as blacks. If insolated for a longer time, say an hour, till thoroughly saturated with sunlight, the image will appear much more distinct. Thus there seems to be no limit to the reproduction of engravings.

Take a tin tube lined with white, let the sun shine into it for an hour, place it erect on sensitive paper, and it will give the impression of a ring, or reproduce the image of a small engraving and of a variety of objects at pleasure—feathers, figured glass, porcelain, for example. Take, moreover, a sheet of

paper, which has been thoroughly exposed to the sun, seal it up hermetically in a dark tube, and the paper will retain the light so effectually, that after two weeks, perhaps longer, it may be used for taking photographs. The Lord Chief Baron, President of the Photographic Society, in his recent anniversary address to the members, might well say of these facts, that 'hardly anything can be more extraordinary.' It is satisfactory to hear that the Society is flourishing, gaining strength as well as experience, fruits of which appear in their *Journal*. We take the opportunity to mention here that the Society's Exhibition is at the South Kensington Museum, where ample space and light are available, and not at Coventry Street, as inadvertently stated in our last.

Photography is now applied to the reduction of the Ordnance Survey maps for engraving; and as the officers of the corps of engineers are instructed in the art, a considerable saving of expense will accrue to the nation. Apropos of this subject, a commission has been appointed to take the Ordnance Survey, the scale on which the maps should be engraved, and other details, into consideration. The names of the commission—Airy, Wrottesley, Roese, Brunel, Vignoles, &c.—are a guarantee that the service required will be well and thoroughly done; and for our part we cannot help hoping that no ignorant member of parliament will be allowed to set aside by a hasty vote the conclusions of men wiser than himself.

A paper by Captain Moorsom, 'On the Practical Use of the Aneroid Barometer,' read before the Royal Society, is worth notice, because of its shewing that the instrument—the aneroid barometer—is still used and in certain cases with manifest advantage. Captain Moorsom used it in a survey for lines of railway in the interior of Ceylon, and found that up to about six thousand feet—the highest points of his survey—its indications might be regarded as trustworthy. As manufactured in London, the aneroid presents an advantage over the French invention by the compensation for temperature which replaces the rigid bar of the index. The Marine Department of the Board of Trade have had the instrument under careful scrutiny for some years with a view to its employment for purposes of accurate observation. At present, it can only be regarded as a not very capricious journeyman to a mercurial barometer.

The Society of Arts announce their tenth annual exhibition of inventions for the month of April; and they offer a special prize of £20 and a silver medal, 'for a writing-case suited for the use of soldiers, sailors, emigrants, &c., which shall combine lightness with smallness of size, durability, cheapness, and the avoidance (if possible) of fluid ink.' Mr Crace Calvert's paper 'On Recent Scientific Discoveries as applied to Arts and Manufactures,' was especially interesting from its practical applications. Coal-tar has been of late a fertile mine of discovery to the chemist; and now from the alkaloids of coal-tar and from naphthalene, substances are obtained which, in dyeing, give a beautiful purple. They are called nitroso-phenylene and nitroso-naphthalene; and their colour has the invaluable property known to economical housewives as 'fast.' But this is not all; the coal-tar yields also safflower pinks and cochineal crimson, with variations into violet, chocolate, and red; and here again the 'imitation of safflower colour stands soap and light, whilst safflower colours do not.' Next, we hear of 'a magnificent crimson colour,' called murexide, obtained from—the reader will hardly guess—from guano! This remarkable result may be said to have been initiated by Proust's discovery of purpate of ammonia in the fæces of serpents: hence years of patient research by the expertest of chemists have been spent in working it out. And for green,

dyers are no longer to be dependent on combinations of blue and yellow, but on a substance new to the English market, imported as 'green indigo,' from China, and in the use of the green colouring matter of plants—chlorophyll, as botanists call it. This product is actually obtained from grass by boiling, and a course of chemical treatment which causes a green precipitate to fall. Another product is 'patent gum,' also for the use of dyers, to be employed instead of the flour and other farinaceous substances which they now have recourse to for thickening their mordants, consuming annually hundreds of tons. 'The patent gum is manufactured by adding to one ton of dry farina sixty gallons of buttermilk, and calcining the whole in the ordinary way.' Mr Calvert further made public a process for preparing sulphurous acid on a large scale without danger, at the rate of thousands of gallons a day if necessary; and he finds that sulphurous acid is an excellent refiner in the manufacture of sugar; and that if brewers will be careful to wash their casks and coolers with a solution of this acid, they will not have to complain of their beer turning sour. These instances will convey a notion of the nature of Mr Calvert's paper, and shew, moreover, what important practical and useful consequences may follow from refined and abstract studies. The philosophical chemist working out subtle conclusions in his laboratory, inspires the genius of application, and in due time commerce and the working population have a new resource. Twenty years ago, M. Gaudin shewed to the Academy of Sciences at Paris specimens of artificial rubies manufactured by himself; he has recently laid before them specimens of artificial sapphires.

The question of steel railway bars is still under discussion: iron rails wear out much too fast; but, except for the 'points' or switches, the harder metal has not come into use. Some engineers contend that its introduction would effect a great economy, as is shewn by instances of another kind. A peculiar sort of steel made in a puddling furnace is now used for steam-boilers, under the name of 'boiler steel' and 'homogeneous metal.' Made into boiler-plates, it is much lighter and stronger than iron; and having been satisfactorily tried on board a war-steamer, three sets of boilers for other government vessels have been constructed at Woolwich. Where quick action is required, the 'homogeneous metal' has a decided superiority; moreover, it does not rust. We hear that the plates for Dr Livingstone's steam-launch are made of it.—Concerning iron: at the last meeting of German naturalists, a piece of fossil iron was shewn; and a fossil tree, found in a floating island off the coast of Sweden, in which the minute cells were replaced by native iron. These are facts of high interest to geologists, especially the latter, as it furnishes additional evidence that iron is an aqueous deposit.

Professor Bailey (United States) brings forward new facts to shew that green-sand is a formation produced by shells of those tiny creatures *Polythalamia*; and in the course of the oceanic survey, it has been discovered that a similar formation is now going on at the bottom of the Atlantic, chiefly in the line of the Gulf Stream. Hence, like coral, green-sand is of organic origin. Another geological fact from the same quarter is that artesian wells have been bored by the army-engineers in the great arid plains between the Mesilla Valley and New Mexico, and with perfect success. When Congress can be persuaded to vote a sufficient sum, wells will be opened all along the line of travel, and the 'manifest destiny' will cease to fear perishing by thirst while accomplishing itself in that direction.

The culture of the vine—viniculture, as some call it—is spreading in the States. There are more than

2000 acres of vineyards in the neighbourhood of Cincinnati alone; and Ohio now produces yearly 500,000 gallons of wine. The most esteemed grapes are the *Catawba* and *Isabella*.—The Academy at Paris offer a prize for an essay on 'Experimental Determination of the Influence exerted by Insects on the Production of Diseases in Plants.' It is wanted for the year 1860.—The *zétout* eaten by the Arabs in Algeria, is found to be the bulb of *Iris juncea*, and fifty times more nutritious than the potato. The *Société d'Acclimation* have introduced it into France, and are trying to cultivate it to a larger size than it arrives at in African soil.—The council of the Royal Agricultural Society state in their Report just published that their last year's exhibition at Salisbury was 'one of the most remarkable assemblages of live-stock ever held in this country.' Chester is to be the place of meeting this year, and it will be characterised by the distribution of a considerable number of local prizes; among which are sums from L.1 to L.10 for dairy-maids and cheese-makers. The Society's Journal contains a continuation of Mr Henfrey's paper on Vegetable Physiology, and a report by Professor Simmonds on the Steppe murrain, or *Rinderpest*—the cattle disease which has for some time past been much dreaded by farmers and graziers. The author suggests an origin in the plague of cattle in Egypt, mentions the murrain of which nearly all the cattle in Charlemagne's dominions died in 810, treats of the symptoms and effects of the disease, and of the precautions to be taken to prevent its importation; and concludes by saying, that 'no definite plan of treatment can be laid down, except it is that of supporting the fleeting vital powers while nature is attempting to rid the system of the poison, and then endeavouring to counteract the ill effects which ensue.'

Dr Stark's address to the Meteorological Society of Scotland bears encouraging testimony to the progress of the science of the weather north of the Tweed. The doctor believes that our prevalent winds have much more to do with the temperature of the island than the Gulf Stream has; he traces the phenomena of atmospheric waves, and discovers the storm period which is one part of their manifestations, from November to March inclusive. Storms, as experience shews, may be looked for about the 20th of November; storms again in February; for the other months, the data are not yet fully made out. He recommends that a barometer should be set up at every fishing-port, under charge of one person competent to note its indications, and advise fishermen accordingly. A fall always tells the passing or approach of the hollow of the atmospheric wave; and it is the hollow, and not the crest, which brings storm and tempest. He touches, too, on the theory of storms, and with a practical application to the seas around our own coasts, and to the Atlantic; we quote the passage for its obvious utility: 'As our winter-storms,' says the doctor, 'seem to be chiefly dependent on an atmospheric wave stretching in a line from north-east to south-west, and moving with very great velocity from the north-west to the south-east, all our great winter-storms will come in the direction of the line of that wave—that is, either from the south-west or north-east. If the mariner, therefore, with a falling barometer, finds the wind setting in from the south-east, and as it increases in strength, veering towards the south, he may expect the storm to burst over him from south-west. If, on the other hand, with the falling barometer, the wind sets in from the south-east, and as it increases in strength, veers towards the east, then he may expect the storm to burst on him from the north-east. In both cases, therefore, he will be brought most speedily out of the storm if he put the head of the ship to the north-west. In every other direction he would only be driving before the storm.'

MY FRIEND.

My Friend has a cheerful smile of his own,
And a musical tongue has he,
We sit and look in each other's face
And are very good company.
A heart he has, full warm and red
As ever a heart I see;
And as long as I keep true to him,
Why, he'll keep true to me.

When the wind blows high, and the snow falls fast,
And the wassailers jest and roar,
My Friend and I, with a right good-will,
We bolt the chamber door:
I smile at him and he smiles at me
In a dreamy calm profound,
Till his heart leaps up in the midst of him
With a comfortable sound.

His warm breath kisses my thin gray hair,
And reddens my ashen cheeks;
He knows me better than you all know,
Though never a word he speaks;
Knows me as well as some had known,
Were things—not as they be:
But hey, what matters? My Friend and I
Are capital company.

At dead of night when the house is still,
He opens his pictures fair,
Faces that are—that used to be—
And faces that never were.
My wife sits sewing beside the hearth
My little ones frolic wild:
Though—Lillian's wedded these twenty year,
And I never had a child.

But hey, what matters? when they who laugh
May weep to-morrow: and they
Who weep be as those that wept not—all
Their tears so long wiped away.
Let us burn out, like you, my Friend,
With a bright warm heart and bold,
That flickers up to the last, then drops
Into quiet ashes cold.

And when you flicker on me, my Friend,
In the old man's elbow-chair,
Or—in something quieter still, where we
Lie down, to arise all fair,
And young, and happy—why then, my Friend,
If other friends ask for me,
Tell them, I lived, and loved, and died
In the best of all company!

UNNATURAL DEATHS IN ENGLAND.

The registrar-general, in his last quarterly return, shews that the mortality for all England and Wales is 22 in the thousand, while in 64 districts throughout the country in which the sanitary conditions are the least unfavourable, it is only 17 in the thousand. 'Without affirming, on physiological grounds, that man was created to live a destined number of years, or to go through a series of changes which are only completed in eighty, ninety, or a hundred years, experience furnishes us with a standard which can only be said to be too high. 17 in 1000 is supplied as a standard by experience. Here we stand upon the actual. Any deaths in a people exceeding 17 in 1000 annually are unnatural deaths. If the people were shot, drowned, burned, poisoned by strychnine, their deaths would not be more unnatural than the deaths wrought clandestinely by disease in excess of the quota of natural death—that is, in excess of seventeen deaths in 1000 living.' By this calculation, it would seem that the number of unnatural deaths last year was 96,520.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 222.

SATURDAY, APRIL 3, 1858.

PRICE 1½d.

ON SQUINTING AS ONE OF THE ARTS.

OCCASIONALLY in the world's history arts have been lost. Thanks, however, to man's ingenuity, their number is, on the whole, upon the increase. Sometimes they spring up in a night, invented and patented before morning; sometimes they have a long struggle for existence, but win it in the end. Perhaps the most interesting cases are those where despised merit at length makes good its claim, asserting itself until the Society of Arts is forced to open its ranks for a new member. It seems to us that the claims of squinting, to be considered as such, have never as yet been recognised nor even examined. At the best, it has never taken higher rank than as an accomplishment, giving a very limited pleasure to very few, and utterly barren of other results. Certain new ideas, however, have at length brought it into repute, and made it prominent in society as an intellectual relaxation. Not only so, but the power of judicious squinting—a power susceptible of a high degree of cultivation—has become, in the eyes (how we miss the usual phrase, 'in the hands!') of the philosopher, a valuable instrument of scientific investigation.

These are not paradoxes, but simple matters of fact. If we were not continually being reminded, by the history of science, that the simplest secrets are the last to be discovered, it would astonish us to reflect for how long a time men lived in ignorance of the advantage of having two eyes. They would realise, of course, under the contingency of losing one, the convenience of having the other to fall back upon; but not until the second quarter of this century was it clearly seen what other specific purpose was served by a double organisation; or in what respect, except that of beauty, which is after all conventional, the perfect man was superior to the Cyclop. The history of this discovery is wonderfully interesting. It may thus be shortly written: A few ingenious gentlemen squinted thoughtfully and knowingly for a few evenings, and the problem was set at rest. Science was satisfied, but the art of squinting had yet to be popularised. Science, out of gratitude, lent her aid, and invented a stereoscope; thus making a repetition of the original experiment, to which she was so much indebted, to become a charming recreation for all, and teaching, amongst other things beautiful and instructive, how much is gained by the power of judiciously converging our optic axes.

When a one-eyed man looks, as we have seen one look, into a stereoscope, and declares the effect to be wonderful, we feel for him; but delicacy forbids us to expound to him that he has missed the purpose

of the instrument, nor can ever see its true wonders. When a lady, on the other hand, naively declares that the effect is to her improved by closing one eye, we see that she is one who is not living up to her privileges, and proceed gently to shew her that she is sacrificing one of her most important optical advantages. 'Madam,' we say, 'you cannot squint with one eye; and this little instrument was invented simply to assist you to squint—nothing more.' Having startled her to attention, we explain to her that with one eye she was simply looking at a photograph slightly magnified, the objects in which were rendered apparently solid only by the distribution of light and shade, as in an ordinary picture; but that there are two pictures on the slide, which are dissimilar, and that both of these must be seen together, before any real solidity is given. That the lenses do combine these dissimilar pictures into one, is perhaps most simply shewn by covering them over alternately with a piece of white paper on which cross-lines have been drawn; the cross is then seen, on looking into the instrument, to be lying upon the uncovered picture. 'You see then, madam, that one must be placed on the other.' She evidently thinks it in a double sense an imposition.

However, our present purpose is not with the stereoscope, except in so far as it is an appliance which enables thousands daily, without their knowing it, to practise an art whose claims we happen now to be taking under our especial patronage. Squinting, in fact, opens a new source of pleasure, and puts us in possession of a new power absolutely unattainable by any other process. It was invented long since, this art of seeing double; but probably, from being known to be a power often developed under discreditable circumstances, and obtained, it would seem, only in exchange for other more valuable faculties, it has fallen into disrepute, and is rarely practised in sober society. Now, however, that in these our times its practice has become with artificial aid an almost universal recreation, its advocacy can be open to no suspicion.

We are familiar, and men have long been so, with the idea of machinery superseding manual labour; but few realise the fact, that the purpose of an optical instrument can be to save muscular exertion; and yet we may reasonably enough imagine what would have been the consequences of the *non*-invention of the stereoscope. The wonderful results brought to light by squinting would for a time have remained known only to the philosophers. Those few who could appreciate the scientific import of those experiments, to which we have before made reference, would

have repeated them with their proper eyes, and communicated the results to one another. Soon, however, the general world would have caught up the interest; a mania would have set in, and the optic muscles of society at large would have had a hard time of it. Fortunately, a philosopher appeared as a *Deus cum machinâ*, and saved them; so that now those who want only to enjoy the results, and are content to wonder, are spared the necessity of subjecting their optic axes to a tedious drill.

In this case there is a royal road, cheap and expeditious enough. But it is, as it were, a railway cut through a tunnel and between close embankments, and those who travel by it see nothing by the way; so that, for so short a distance, we advise those who like exercise and roadside interest, to walk it.

It was announced, at the time of the first introduction of the stereoscope, that the same results might be produced without the instrument as with it, by the simple convergence of the eyes to a point in front of and between the two diagrams. There were few, however, who tried the experiment with success, and fewer still who arrived at any conclusion as to how the appearance of solidity was produced by these means. Squinting, in fact, with precision is a difficult matter. With most persons, the attempt to bring the eyes to a point at a distance of eight inches in front of the nose, would probably be not attended with immediate success; and to bring that point back or throw it forward an inch at the word of command would require some practice. The fingers, however, must learn to measure on the violin lengths which are calculable with mathematical nicety, before the right note can be sounded; and so, all the other arts presuppose the exercise of a certain amount of mechanical dexterity. If any possess, or have eightiennence to spare upon, the well-known stereoscopic slides which consist of mathematical figures in white lines on a black ground, let him endeavour as hereunder written. Holding one about a foot from him, and directly in front, let him place the point of a pencil in the centre between the two diagrams, and then move it gradually towards his eyes, steadily looking at it. At first, the two diagrams will be seen as four, for no single object appears single to us unless we are looking directly at it, as may be verified by holding a printed page about half a foot behind a candle and trying to read it through the flame, when the flame will be seen double. As the pencil, however, approaches, a point will soon be reached when the four diagrams will have become three, the two middle ones approaching one another, and at last coalescing. Here stop, and looking still at the pencil, suddenly withdraw it, and leave the eyes fixed upon the point where it was. A stereoscopic image is now visible to those who will take a little trouble to see it. Not the same, however, as the same slide will give through the stereoscope, but that reversed. Sixteen out of the twenty-five which form the set are reversible without distortion; the others are simply thrown into Chinese perspective. As we are concerned only to view the middle one, the outside diagrams of the three are in our way; can we not get rid of them? The triple appearance is simply accounted for: the right eye looking at the left-hand picture still sees the other one—just as, though looking at one candle, we still are conscious of another, if it happens to be near it—and the left eye, again, though it is looking across at the other picture, still sees out of its corner that which is immediately in front of it. To shut the obtrusive images out, all that is wanted is a card with a hole in it about an inch square: this held with the middle point of the hole where the pencil was before it was withdrawn, will let the stereoscopic image through, and stop the two others.

A small cardboard box about the size and shape of an ordinary stereoscope, with such a screen as we have described fixed permanently in it at the proper distance—which may readily be found by experiment—and two holes at the top for the eyes, will, we may promise our readers, fully repay the small investment of ingenuity and trouble required for its construction. If across the aperture of the screen a thread is stretched with a small knot in the centre, it will generally direct the eyes even of the uninitiated squinter at once to the precise point at which the stereoscopic effect starts into view. We have thus not only put ourselves out of all obligation to lenses, but we have obtained a most curious and interesting result. The solid image we now see differs, as we have said, from that which the same diagrams produce for us when looked at through the ordinary stereoscope. It seems nearer to the eyes, and smaller than before, and is, besides, reversed, concavities having become convex, a raised pyramid shewing like a hollow box, and a railway tunnel being turned inside out, as one might serve a stocking. Does any one ask the reason, he is in a fit state to receive further instruction. Par-chance, friend, thou knowest not the distinction between fore and aft squinting. The former of these mysteries of the art we have already descanted upon; the latter, though not generally open to neophytes, we are not unwilling to divulge.

There are, we imagine, few persons who can readily converge their eyes to a point further from them than two objects, as two candles, so as to see an image of a third candle between them. It is not, however, by any means an unattainable feat. The first condition of success is that the two objects be nearer together than the two eyes. The ordinary stereoscopic slides are unfit for the purpose of these further experiments, corresponding points upon them being not closer to one another than two inches and a half. Some of those geometrical diagrams which we have mentioned are, however, so simple that they may readily be drawn to a diminished scale. With a pair so drawn, the attempt may be made. A hint to success may be furnished from these considerations. We shall want, as before, to banish the two side-images; but as the eyes are now not to cross in front of the diagrams, the left-hand diagram must be concealed from the right eye, and conversely, so that the eyes may look straight forward at the pictures in front of them respectively. To do this at once will therefore simplify the problem. Place the two diagrams nearly close together upon the table; hold a card vertically as a wall of partition between them, so that the eyes may look each down a different side of the card. Soon a single picture will be seen, or rather, we should say, a solid image produced by the combination of the two pictures. This image will be the same as is produced in the ordinary stereoscope by the same diagrams placed in the same way: so that, if we construct a small box with a vertical wall of partition permanently fixed in it, we have a home-made stereoscope without lenses; its only imperfection being that it is not adapted for viewing pictures of the size of those with which photography now so abundantly supplies us. These may be used with the box we first described, and since that will reverse them, strange and highly curious results will sometimes be produced. The foreground of a landscape, for instance, may retire into the distance, and the objects in the background come forward, while a street may be thrown into perspective that agrees better with Hogarth's caricature than with the rules of the Academy. If we cut a slide in two, however, and make the diagrams change sides, our first box will unite them into a true solid image, while a box of the construction last described would, if the distance between our eyes

were greater than it is, distort them. The lenses of a stereoscope, therefore, aid us in two ways: they give us the advantage of viewing larger pictures; and, again, save us the trouble of finding the right point at which to look, by artificially placing the two pictures together, and leaving us to look at them at our leisure. For our part, gratefully acknowledging this assistance, we yet contend that as long as the optic axes remain uneducated, men will not appreciate at its true value a discovery which throws clear light on part of the mystery of vision, and distinctly gives the nineteenth century a new idea. That we obtain our perception of solidity from the fact, that the two images of a solid body formed in the two eyes are dissimilar, could not be demonstrated otherwise than by recombining two such dissimilar plane images, and obtaining therefrom a perception of solidity. Herein was the art of squinting the hand-maid to science. Most persons, regarding the stereoscope as belonging to the genus 'optical instrument,' are content to set its wonders down to natural magic, or say generally that it is an illusion of the eyes. True; but as it is an illusion which any one, with ten minutes' practice, may reproduce at pleasure without any instrument whatever, and helps, moreover, wonderfully to explain that other illusion of our seeing things as they really are, it is well to try our own powers, and reflect upon what they make manifest to us. Therefore do we advocate an art, through the practice of which a few minds in the present generation have been led up to the discovery of highly interesting truths of science, and the multitude enjoy a pleasure which never would have existed but for that discovery. There must be something in it.

THE SANTA CASA OF LORETTO.*

REASSURED by a night of well-earned sleep, the morning following our arrival in Loretto found us assembled in the general sala of the inn, waiting for breakfast and the return of the V—— family, who, the servants told us, had gone out soon after dawn. They speedily came in with cheerful faces, having fulfilled all the devotional exercises prescribed to devout Roman Catholics on their first visit to the Santa Casa, and were now ready to enter cordially into the survey of the church and all the curiosities it contained.

While we were still at table, we heard a voice in rich oily tones, accompanied by a boisterous laugh, inquiring for the *Signorine Inglese*. Presently a short, stout, very stout, priest entered the room, and apostrophised as *il Signor Canonico*, was greeted by my cousins with unforgotten friendliness. It appeared he had known the family some years before, having been the curate of their parish in Ancona. The exercise of his duties used occasionally to lead him to my uncle's house—at such times, for instance, as blessing it at Easter, or distributing the tickets for confession to the servants—opportunities which he never failed to improve in a little attempt at converting the signorine. Now it would be the present of a life of Santa Filomena, or some other saintly legend, which they were implored to substitute for other reading; or again, a medal or relic to be suspended round their necks, and win them to the fold. These simple devices invariably proving abortive, the poor padre would shake his head, look at them with tears in his eyes, and plunging his hand into a capacious pocket, draw thence a goodly

packet of sugar-plums, in the discussion whereof all controversial bitterness was soon forgotten.

These amicable relations had for some time been suspended, owing to his prospering in the world, and having been translated to a canon's stall at Loretto—evidently an easy and thriving post. As soon as the first expressions of pleasure at this unexpected meeting were over, the canonico was introduced in form to the V——s, the officers, and the *cugina forestiera*, and had a varied compliment for each member of the party; after which, without the slightest modulation of voice, but rather if possible pitching it in a higher key, and with an indescribable play of feature and vivacity of gesture, he began inveighing against his young friends for not giving him timely notice that they were coming to Loretto, when they might have eaten *due bocconi* (two mouthfuls) at his house. Precisely for this reason, they replied, had they determined not to apprise him beforehand, knowing his hospitality would have led to the commission of some *pazzia* or folly upon their account. At this pleasantry he laughed and wheezed till he was nearly black in the face; but on recovering his breath, insisted that, although it was certainly too late to think of preparing a dinner, they should not be let off so easily as they expected, and must therefore, with all the honourable company—making a circular movement with his hands—come at noon and take *la cioccolata* under his poor roof.

The good man was clearly so much in earnest, that it would have been ungracious to decline, and an appointment was accordingly made for that hour. This important business being satisfactorily adjusted, he took his leave, and we set forth to visit the fane where pilgrim-kings have worshipped.

Strangers were evidently no rarity in Loretto, and the admiring gaze of the population did not greet our appearance as at Umana. Simply looked upon as travellers, and legitimate objects of prey, we were soon beset by the vendors of the trinkets peculiar to the place, and imposed on without mercy. I have no hesitation in saying that the *corone*, or chaplets, with which the midshipmen persisted in filling their pockets, and the bracelets of ten beads called *corone alla moda*—an indefinite supply whereof *l'officier marié* seemed to consider indispensable to his wife—were charged them at least three times their value. The main street, already noticed, opens upon a spacious square, adorned by a fountain and two handsome colonnades, and flanked by the palace of the bishop and the Jesuits' College; at the upper end, on a rising ground, stands the church of the Santa Casa, a large and commanding edifice.

The interior is profusely decorated, and contains numerous side-chapels enriched with pictures in mosaic; but the object on which the eye first rests on entering is a structure of an oblong form of white Carrara marble, completely incrustured with statues, Corinthian columns, and exquisite bass-reliefs, placed on a platform accessible by three or four broad steps, immediately beneath the cupola. This is the far-famed Holy House, or, more properly speaking, the costly building raised over the reputed cottage of Nazareth, at once to impede its future migrations, and preserve it for the edification of the faithful. Passing into the sacred tabernacle, a gorgeous vision strikes upon the senses—golden lamps suspended from the ceiling, shed a mellow but subdued light upon an altar, where jewelled chalices, crucifixes, and candelabras are arrayed in glittering profusion, surmounted by an image, whence literally a blaze of diamonds is radiating. Here prostrate forms are always seen, and brows bent low in penance or adoration; and here many a guilt-worn wretch, coming from distant realms, in penury and toil, has sunk rejoicing on his knees, and deemed his pardon won!

* See Journal No. 305, *From Ancona to Loretto*. The present article forms the sequel of a somewhat remarkable series of papers descriptive of life and manners in Italy, written by an English lady brought up in an English family, but in the heart of native society. In the preceding one, the authoress, accompanied by a party, already introduced to the reader, proceeded from Ancona to Loretto; and this contains a description of the Holy House of that place. Another article, giving an amusing account of a notable Carmelite convent, will conclude the series.

Above, around, on every side, are evidences of the piety and liberality of the princely votaries to the shrine, whose offerings were pointed out with conscious pride by the young priest who had attached himself to our party. The figure of the Madonna and Child, rudely carved in cedar, and said to be the workmanship of St Luke, is absolutely covered with gems. The two heads are encircled with tiaras of immense value, and the black velvet in which the shapeless trunk of the image is enwathed, is scarcely discernible amid the ear-rings, necklaces, and chains of the most sparkling brilliants overlaying it. Each jewel, and candlestick, and lamp, has its doocor and its history, all duly registered in printed catalogues annexed to the authenticated relation of the house and its mysterious fittings. This book sets forth how, in the year 1294, the Santa Casa, where the Virgin had weekly dwelt, and watched the childhood of her son, was first lifted from its foundations by angel hands, and borne from Palestine to Dalmatia. After a short interval, the same supernatural agency transported it across the Adriatic to a hill in the vicinity of Ancona; thence, after one or two brief haltings, it was finally conveyed to Loreto, where the speedy erection of a church over the precious deposit, attested the piety of the inhabitants, and secured them the continuance of its presence.

From that time the cottage of Nazareth went on increasing in fame and riches; miracles were wrought by its influence, and princes and pontiffs contended who should do it honour, until 1797, when the sun of its prosperity became clouded. The pitiless exactions of the French compelled Pius VI. to have recourse to the treasures of the Madonna di Loreto to meet his conquerors' demands; and in the following year, the fierce invaders captured the town, and sent the venerated image to Paris. It was restored, however, a few years afterwards, to the joy of all sincere adherents to the church, and was solemnly crowned by Pius VII. with those same diadems whose rainbow lustre dazzles the beholder.

The internal dimensions of the Santa Casa are those of a mere hut—27 English feet in length, 12½ in breadth, and proportionably low. The ceiling is blackened by the smoke of the many lamps which are perpetually burning; the lower walls are covered with plates of silver, gilded and wrought into bas-reliefs, except on one side where a portion of the original masonry is left exposed. It is of course brick-work, discoloured by time, and worn smooth by the kisses continually pressed upon it. The priest pointed to a rude sort of recess, which he told us was the fireplace of the Holy Family, and then produced a cup or bowl called *La Scodella Santa*, from which the Madonna used to drink. All the faithful reverently press their lips to this relic, and then place in it their chaplets, crosses, or medals, to be blessed.

The well-known story of a channel being worn on the pavement immediately surrounding the Holy House, by the knees of pilgrims, is not in the least exaggerated. There are two distinct furrows in the marble, traced there by the thousands who have yearly dragged themselves, in this attitude of devotion, for a given number of times around its walls. At the moment of our visit, several peasant-women were thus shuffling along, seemingly without much inconvenience, with the exception of one, whose attitude and appearance produced a painful impression on my mind. She was working her way round on her hands and knees, drawing as she went a line with her tongue upon the pavement. I know not how long she had been in that position, but it was horrible to view: her face was black and swollen; her eyes starting from their sockets; the veins on her forehead standing out like tight strained cords, and mingled blood and saliva flowing from her mouth. Our conductor looked unconcernedly

at the poor wretch as we passed, and said in an easy, my appealing glance: 'It is only a great pain, you may be sure she richly deserves it: there are many who come here in this way to expiate their sins;' and then walked on, leading the way to the treasury, as if the subject were too commonplace for further consideration.

The *Sala del Tesoro* is a magnificent hall richly painted in fresco, the ceiling representing the death of the Madonna, surrounded by the apostles, and the walls furnished with immense presses with glass-doors, in which are deposited the numerous and yearly increasing offerings to the shrine. Many of these are of great value, although of course not equalling the splendour of those displayed upon and around the image. Some evidence considerable eccentricity in the donors, such as the king of Saxony's wedding-suit, a full court costume of gold and silver brocade, estimated at I forget how many thousand crowns; others, again, are of a devotional type—silver statuettes of saints, crucifixes, and church vessels; but the majority of gifts comprise necklaces, gold chains, rings, brooches, watches, caps, flags, silver hearts—contributions from every nation and every class—from the gemmed *serafes* that lately sparkled in the saloon of the quartier St Germain, to the coral pendants a poor cottager has proffered in gratitude for last year's vintage.

At a moderate computation, the present collection would amply stock a score of jewellers' shops; nevertheless, as a gray-haired asceticism informed us with a sigh, it is not worthy to be named in the same breath with the glories of the ancient treasury.

Thence we were reconducted to the church, to see the mosaic pictures in the side-chapels, full-and admirable copies of celebrated masters, and of course most valuable from the tedium and minuscule requisite in their execution. Besides these there are some originals by Guercino, and other celebrated artists, their subjects mostly referring to different passages in the life of the Virgin, as supplied by legends of the east, the writings of Dionysius the Areopagite, and other traditional sources. But of all the monuments of the piety or ostentation of the Roman pontiffs, who for centuries lavished large sums on the adornment of this edifice, nothing can compare with the marble casing that encloses the Santa Casa. This costly monument of the best times of Italian art, projected by Julius II., was commenced under Leo X.; and in its execution the most eminent sculptors seem to have vied in leaving worthy memorials of their skill. Designed by Bramante—Sansovino, Bandinelli, Giovanni da Bologna, besides others scarcely less illustrious, were employed on the base-reliefs, and those groups of prophets and sibyls, which in majestic beauty still rivet the admiration of the beholder. There is a figure of Jeremiah, by Sansovino, at the angle of the western façade, the sublime mournfulness of which haunts me even now.

We were still engaged in our survey, when we were joined by my cousin's friend the canonico, panting for breath, who had come to remind us of our engagement. Accordingly, we adjourned on horse to his habitation, situated in a very miserable narrow street, or rather lane; and climbing up a steep, dark, and indescribably dirty staircase, arrived at last at the *ultimo piano*, where the door was opened with many courtesies by a middle-aged, demure-looking personage, introduced by the canonico as *La Signora Placida*, his niece and house-keeper.

The entrance-hall was in the usual style of dwellings of this description, with four carved-back settles or benches, some undistinguishable oil-paintings in frames that had once been gilded, a clothes-horse, a broom, and dust-pan—whose offices were more sinescure, to judge by the appearance of the floor—and so on.

From this we were ushered into the *sala*, which contained a horse-hair sofa, so hard and high that one was perpetually slipping off, and six chairs to correspond; a folded card-table whereon stood a silver *lucerna*, and a press with glass-doors, in which a set of cups and saucers was displayed.

To accommodate their numerous guests, our host and his niece brought in a number of chairs from adjoining rooms, and seated us with great bustle and ceremony; an operation diversified by the Signora Placida's continually darting into some obscure region of the house, whence she could be overheard disputing with a shrill-voiced attendant, or energetically clattering glasses and plates, in a manner that singularly belied her name. Meantime, the canonico talked and gesticulated, patted the youngest midshipman on the head, to his evident disgust, entertained Madame V— with the history of his relative, on whose virtues he pronounced a glowing panegyric, and recounted to the consul the latest miracles performed at the Santa Casa, while he shook his finger playfully at my cousins, as if menacing them with a return to their ancient hostilities. Presently the circle received an addition in the shape of another priest, Don Antonio, a great friend of our canonico's, and almost as rosy, and puffy, and jovial as himself, who now came to have his share of the good things and see the *forestieri*.

This was one of those quaint Italian friendships I have so often noticed. It commenced in boyhood at the seminary, had been renewed on our host's establishing himself at Loretto, and would probably continue unbroken till the end of their days. Regularly as clock-work used Don Antonio to come every evening to make *la società*—limited to himself, I believe—play at cards, and discuss the petty scandal of the place. I asked him if they ever read, at which he shrugged his shoulders, and said that after going through the daily office in the breviary, for his part he must own he had had enough of study. This facetious response was loudly echoed by the canonico, and they laughed over it in chorus with a sound more resembling the shaking of stones in a barrel than any human manifestation of hilarity.

The chocolate was now brought in by the *serva*, and handed to us by the two friends and the niece. It was made thick, and served in cups without handles, and tea-spoons not being apparently considered requisite, the uninitiated found some difficulty in discussing it with propriety; but after watching our entertainers, we perceived that the approved method was to steep in it morsels of rusks which had been distributed at the same time, and then convey them daintily to one's lips through the medium of the thumb and forefinger. This was followed by trays of ices and sweetmeats from the *caffè*, the canonico observing significantly, he well remembered the signorine were always fond of *dolci*; and when, to please him, every one had eaten as much as he possibly could, he insisted on pouring all the remaining *bou-bons* into our handkerchiefs, to amuse us, as he expressed it, on our way home.

When it was time to think of going, he declared we must first see the house, and took us into a small adjoining room, containing a writing-table with a dried-up inkstand, and two or three shelves adorned with some very dusty dry-looking folios in parchment covers. This den, he told us, he retired to when he studied or had letters to write—both rare occurrences, it was evident. Next we were shewn the dining-room, with no furniture but a table and rush-bottomed chairs, and opening into the kitchen—a custom also generally followed in houses of higher pretensions, but opposed to all our notions of quiet or refinement; and, lastly, into his and the niece's sleeping apartments, in each a clumsy wooden bedstead, rickety chest of drawers—on which, under a glass shade, stood a figure of the infant St John in wax, with staring blue eyes

and flaxen curls—two chairs, the usual tripod-shaped washing-stand, and an engraving of some devotional subject, with a crucifix, a little receptacle for holy-water, and a palm that had been blessed at Easter, hanging near the pillow. You may enter a hundred bedrooms in families of the middle class in this part of Italy, and see them fitted up after the same pattern; those of the provincial nobility have a little more display in mirrors, or pictures, but no greater comfort.

The introduction of all the visitors into the canonico's chamber was not, I suspect, wholly without design; for our attention was speedily attracted to a *cotta* or alb of fine white cambric lying upon the bed, the most elaborate specimen of the art of *crimping* it was possible to behold. The niece immediately held it up for our closer inspection, while the uncle stood by smiling; and in answer to our praises of the exquisite designs of flowers, leaves, &c., with which it was wrought, entirely by a manual process, told us it was the work of the nuns of a particular order—I forget the name—a very strict one, moreover, who, by way of serving the altar, dedicate themselves to the preparation of this part of the priestly vestments. This marvellous example of fine plaiting, however, was but the least recommendation of the ephod, which was trimmed with a deep flounce of the most magnificent point-lace.

'Look at that, look at that!' chuckled the canonico, rubbing his hands with glee; 'that is the lace which all the ladies of Loretto, and Recanati, and Macerata—yes, all of them together—are envious of, when I walk in the procession of the Corpus Domini! I have been offered five hundred dollars for it by a Russian princess who came here on a pilgrimage; but I could not make up my mind to part with it. Look at that tracery—look at that ground, it is perfect—not a thread broken;' and he descanted on it with the zest of a connoisseur.

When he paused in his raptures—'Signor Canonico,' meekly suggested La Signora Placida, 'may I fetch the stole you have just had worked?'

'Ah, the little vain thing!' was the rejoinder; 'she is so proud of my vestments! It is a trifle though—Well, well, bring it out.' And from a long pasteboard box, duly enveloped in tissue-paper, the Signora Placida drew forth a gorgeous stole, the original texture cloth of silver, but almost concealed by raised embroidery in gold.

'The canonico has not worn this yet; it is for the great *funzione*—that is, church-ceremony—of the Madonna in August,' said the niece, with as much earnestness as if she were a lady's-maid talking of her mistress's preparations for a ball, and disposing it so that it might be viewed to the greatest advantage. It really was beautiful as a work of art, due to the skill, as Don Antonio informed us, of another set of nuns, who exclusively applied themselves to needle-work in gold and silver.

The pleasure this good man took in the display of his friend's possessions, impressed me very favourably. 'Per Bacco!' he exclaimed, handling the vestment with respect—'each time I see it, it strikes me more! It is worth—ss—ss—ss—ss,' emitting a long syllabatory whistle, expressive in the Marche of something unlimited, whether of good cheer, astonishment, money, or so forth.

'Via, via,' said the canonico modestly, 'it is not much a poor priest can do. Still, we may place it at the same value as the lace, and be within the mark.'

Our reiterated admiration evidently enchanted the trio; in fact, it was altogether with the most amicable feelings, and with mutual thanks and protestations, we took our leave, the politeness of our entertainer and Don Antonio leading them to give us their company in visiting the bishop's palace and the Farmacia, or pharmacy of the Santa Casa, the last

renowned for its collection of *majolica*, consisting of three hundred vases coloured from designs by Raphael and his pupils.

No adventures befall us in these perambulations, except that we were more beset and pestered than before, if possible, by the beggars, who followed us in troops, and for whom, I learned with astonishment, no almshouse or refuge of any kind existed. Concluding our sight-seeing with another visit to the Santa Casa, there remained but time for a hasty dinner, ere we set out on our return to Ancona—the state of the neighbourhood, as we were repeatedly reminded, necessitating our departure in broad daylight.

The usual scene of clamour, begging, imprecations, and blessings attended our exit from Loretto, a place which presents the strongest contrast of wealth and poverty it has ever been my lot to witness, or entered my imagination to conceive.

A VOICE FROM BAKER STREET.

'I come from Alabama,' but my father's name being of no sort of importance to the public, I reserve it. Suffice it to say that I am an American citizen who has kept pace with his age. I am not only a transcendentalist, but a spirit-rapper; not only a spirit-rapper, but a *clairvoyant*; and *clairvoyance*, comprehending of course the well-known faculty of understanding the thoughts of animals, is all that at present I have to do with. Concluding to judge for myself upon every institution of which the old country boasts, I was present at the Smithfield show this year, in Baker Street, and observed narrowly—if 'narrowly' can be applied to such animals—the fat cattle, and with the most interesting results. I here subjoin an account of a conversation held, upon the evening of the last day of the show, with an enormously obese, but nevertheless exceedingly intelligent pig. Almost all his brethren had been removed to a place which, from motives of delicacy, we had tacitly agreed to call 'elsewhere,' so that our discourse was quite uninterrupted. I had been putting some leading questions to the animal regarding his personal history, and nothing could exceed the candour and openness of his replies. The following is the substance of his experiences, which—as he is, alas! now no more—I feel no hesitation in giving to the public. On my remonstrating with him, at the commencement of his communication, upon his perpetual use of the monosyllable 'Umgh, Umgh,' he repeated it with some acerbity, and continued as follows:

'Umgh, Umgh! I wish I could set down in writing the sentiment which that expression in the mouth of any one of our much-suffering family conveys to porcine ears. No sigh of lover was ever half so affecting, or cost its utterer one-tenth part of the effort, believe me. I am a swine myself, a porker, a Baker Street prize-pig, and I ought to know. Umgh, Umgh. I don't say it comes from the heart, because, like some other over-fed people I might name, I have no heart worth mentioning; but it comes from that spot which the organ of my softer affections, the home of my early memories, the sacred receptacle of the purest feelings of my nature, *did* once occupy—before it was turned into fat. It emanates—does this "Umgh, Umgh"—from "flabby lungs," with "nodules of the size of a kidney-bean imbedded in them;" and if you don't believe me, why, ask Mr F. G. Gant of the Royal Free Hospital, who saw the very last of my dear brother-in-law, who was at my side but the other day.'

'Who is Mr Gant?' said I, with feeling.

'Mr Gant,' replied the pig, 'is a medical gentleman who has most humanely given a good deal of his time

to an investigation of our wrongs. You may have seen some of his letters, perhaps, in the daily paper. In reply to a *post-mortem* examination by this surgeon, it transpired, that my stout connection—~~as you of a~~ a celebrated Berkshire family, and highly esteemed—had been going about, or at least had been lying down upon one side, for the last six months "with a hypertrophied left ventricle, and a liver of a dark livid colour;" besides which he enjoyed "congestion of the hepatic veins of the left lobe." I overheard this as being in the *Post*, one morning, among the rest of the fashionable intelligence, and it gave me quite a turn; which, considering that I weigh one-and-twenty stone, is not, as you may imagine, a very easy thing to do. What did Mr Gant write there in illustration of the pathognomonic condition of my brother-in-law, and other of his Berkshire relatives, while exhibiting in the Baker Street Bazaar? Why this: "They lay helplessly on their sides, with their noses propped up against each other's backs, as if endeavouring to breathe more easily; but their respiration was bad, suffocating, and at long intervals. Then you heard a short catching snore, which shook the whole body of the animal, and passed with the motion of a wave over its fat surface, which, moreover, felt cold." I protest that, when I heard this, a shudder passed with the motion of a wave over my surface, and I dare say, had you put your hand on me just then, that I should have, moreover, felt cold. Why, this beats anything that one ever heard of aldermen. They have laid their heads together often enough for foolish purposes—that of making wooden pavements, for one—but not "with their noses propped against each other's backs," I do believe.

'They do breathe rather stertorously under their pocket-handkerchiefs after dinner, perhaps, but—"Umgh, Umgh"—the most apoplectic of them has the aspiration of a sleeping infant compared with mine. Turtle even twice a day is no match for oil-ease, you may depend upon it. A certain Devon cow, an acquaintance of my deceased brother-in-law, attracted the benevolent surgeon's attention in this exhibition by looking extremely ill, and "laying her head and neck flat upon the ground like a greyhound." He asked an attendant what was the matter with her, who replied: "I knows nothing of them beasties in particular; but it's the case with many on 'em, I knows that." He might have said, with very little exaggeration, "with all on 'em." There was, for instance, His Grace the Duke of Richmond's fat wether—for I am not making a plea for my own kind only, but for sheep or what not, wether or no, in one common cause—had a heart weighing two and a half ounces. "Its external surface was very soft, greasy, and of a dirty brownish-yellow colour," observes the doctor. "On opening the two ventricular cavities, their external surface and substance were equally soft, greasy, and yellow throughout; an appearance due to the infusion of fat between the muscular fibres of which the heart should chiefly consist. This substitute of fat for muscle is proved (by the microscope) to have ensued; for when examined, the muscular fibres no longer presented the characteristic cross-markings, but the *fibrilla* within the fibres were entirely broken up by bright globules of fat. The healthy structure of the beast had therefore thoroughly degenerated by its conversion into fat." The heart of the Prince-consort's Devon heifer had both ventricles completely turned into fat. "Did you hever?" as my poor master used to observe to the general company, when emperoured at some proof of my superporcine sagacity. It was through his good offices—severe as they at the time appeared to me—that I became a scholar.

'I was once the learned pig of Greenwich and other fairs, too numerous to mention. Those fairs have long been abolished. Those days have fled for ever;

but the remembrance of them is still to me most sad, most sweet. "Tears from the depth of some divine despair," well up as I think of them, from the fatty ventricles about my heart, glimmer at those eyes whose lids I am unable to raise without the aid of my friendly feeder, and trickle down my brown pig's cheeks in silence. Umgh, Umgh! Little did the giants of Kent, in the same caravan with whom I had the honour to travel, imagine that I should ever come to rival her in weight and bulk. I think I see, even now, that magnificent arm of hers, hanging, as if inadvertently, out of the caravan-window, so that the people outside were induced to rush in in crowds to pay their pennies. I should have admired it more myself, had it not been for its extreme resemblance in size and colour to a Bologna sausage—a delicacy which I understand to have at least the flavour of pig-meat. Our very dancing-dog was at that time but little thinner than I. We were at feud with one another from first to last. I bit one of his dog's ears, I remember, during a little difficulty we had concerning the equal division of some edible; and it is to his rapacity that I owe the fact of my being destitute of a tail; but now my bowels yearn—figuratively, that is, for I have no bowels that can be called such, says Mr Gant—towards my sprightly companion of other days. Happy Rigdum Funnidos, or, as we, his intimates, were wont to call him, Happy Rig! Though thou wast half shaven as to thy body, in fanciful and even ridiculous resemblance to the king of beasts, and redder as to thine eyes than the very albino whose rival attractions excited our old master to frenzy at every fair, thou art yet at least safe from Baker Street. Be content with thy lot. Whatever haps to thee, it is not likely that "the apex of thy left ventricle has given way" through extreme obesity; or that "the thin lining of the cavity thus produced alone prevents thy death occurring instantaneously."

'When I was a learned pig, and wise in mine own conceit, I was wont to murmur: "Umgh, for a life of idleness! Umgh (or "Ah!" as a man would say), to lie in the sunshine all the day long, with plenty of food to be got at without the trouble of rising!" At that time, I despised intellect. My occupation of trotting about in a literary circle—that is to say, in a circle of capital letters—seemed to me then to be a round of existence tedious enough. The stopping sagaciously opposite to the young lady who was to be married within the year, and to the young gentleman who had not paid for his boots, and the guessing at the probable number of olive-trees which should bless their union, seemed very hard work indeed. Shaking hands with my proprietor at the conclusion of the performance was to me a most painful manifestation of friendly feeling: bowing to the company three times was a considerable effort; and standing upon my hind-legs was perfect agony. But what were such slight personal inconveniences to the miseries I suffer now? It is only when my friendly feeder lifts my eyelids that, as I have before mentioned, I possess any evidence of having either hind-legs or fore-legs. The notion of my now standing up on two—nay, upon any, however great a number of legs—would set me laughing, only that I am fully aware that the slightest cackinnation would cause my immediate decease. Any attempt at a bow would now be indeed a *congé*, and shaking hands, my final farewell to the world. Judges (*sic*) of what is excellent in pigs, connoisseurs in cattle, umpires of this Baker Street abomination (held, as is most fitting, by the by, under the floor of the Room of Horrors itself), have gloated over me admiringly. They have punched and sounded that delicate ground which lies upon either side and above the spot where my little tail once "gracefully curled." (It is a comfort to reflect that even if this had been spared to me, I could

certainly have never turned round so far as to catch a view of it.) They have highly commended me as "Improved Blankshire Breed;" by way of recompense, perhaps, as they fondly imagine, for my "mouth lying open, and nostrils dilating at each painful inspiration."

'They have given me a gold medal to wear at my breast, as if to hide that spot beneath which play—play indeed? *work*, and work very hard—my congested lungs.

'They have called me with their flattering tongues "a picture," but never bestowed one thought upon what it cost me to be put in such a frame. With my spoiled heart, with my labouring chest, with my vitiated life-fluid, I must be a healthy article of food truly; don't you think so, Brother Jonathan?'

'Poor fat pig,' said I, 'you have my most sincere pity. I calculate that you are going to—a—elsewhere, to-morrow; is it not so?'

'Umgh; yes, I suppose such will be my fate. My hope is, my only recompense will be, this—that they, the judges, the arbiters of the destinies of cattle, may buy many pounds of me at the—in point of fact, at the butcher's (the poor animal uttered this hateful name with an emphasis that almost proved the death of him); and then, ah, then—umgh—won't I just disagree with them!'

FRENCH CRITICISM ON SHAKSPEARE.

THE first attempts one nation makes to understand another are generally of a curious character: only the more salient points, the angularities and apparent eccentricities, will be attended to at first—those things which, taken by themselves, are most likely to be provocative only of laughter and ridicule. Men are always more easily taken by the peculiarities than by the general characteristics of their neighbours; and much more is this the case when the people are of a different nation, speak a different tongue, and have different manners, customs, institutions, and forms of government. This is admirably illustrated by the general and popular notion the English and French nations have of each other. Nothing can be more opposite to the true natures of each than this popular judgment. To Frenchmen we are in general a rough, barbarous, wife-selling, beer-drinking, and beef-eating nation; while to us the French are a light, fickle, grimacing, frog-loving, bowing, fiery, restless, volatile race. Now, both people have in a greater or less degree all these characteristics, and are what these adjectives designate; but these are not their abiding natures, the things which have made it possible for each to become the great and mighty nation it is: we must seek for these below the surface; and find out what is permanent, high, and noble in the hearts of them both before we can understand the causes of their greatness, and read the lessons of their histories aright.

It is not, however, to enter into the philosophical inquiry we write the present paper; our object is not of so large and ambitious a character; nor, if we were inclined to pursue this most interesting course, would our space permit of any analysis that would lead to a profitable result. We confine ourselves to the more pleasing process of shewing our readers what one or two of the noted living ones of France are doing to make their countrymen understand Shakspeare—a labour in which we are sure every Englishman will wish them unbounded success.

Times have changed since Voltaire called Hamlet the best of 'those monstrous farces they call tragedies;' and since he was astonished 'how men's minds could have been elevated so as to look at these plays with transport; and how they are still followed after in a century which has produced Addison's *Cato*!'

Our French philosopher thus sums up the reason for this extraordinary fact. 'The English chairmen, the sailors, hackney-coachmen, shop-porters, butchers, clerks even, are passionately fond of shows: give them cock-fights, bull-baitings, fencing-matches, burials, duels, gibbets, witchcraft, apparitions, they run thither in crowds; nay, there is more than one patrician as curious as the populace. The citizens of London found in Shakespeare's tragedies satisfaction enough for such a tone of mind. The courtiers were obliged to follow the torrent: how can you help admiring what the more sensible part of the town admires. There was nothing better for a hundred and fifty years; the admiration grew with age, and became an idolatry. Some touches of genius, some happy verses full of force and nature, which you remember in spite of yourself, atoned for the remainder, and soon the whole piece succeeded by the help of some beauties of detail.'

Since Voltaire wrote, a new race of critics have arisen in France. They have loved, admired, and in a French fashion, idolized Shakespeare. Some of his best plays have been translated, and (alas!) adapted to their stage. *Hamlet* has been performed without a ghost, and Banquo's has been banished from *Macbeth*. Still, the French are trying to understand and appreciate our great poet. Dumas has played with him; and a greater than Dumas, George Sand, has given a condensed and 'arranged' French version of *As you Like it*. Victor Hugo has translated the sonnets into French prose, and has preceded them by a theory which we shall explain by and by. M. Ernest Lafont has translated into French verse the poems and some of the sonnets; and a recent number of the *Revue des Deux Mondes* had an able article upon Shakespeare by one of the most learned of modern French pens. In time, we may hope with something of confidence that the French may know a little more about Shakespeare than M. Voltaire taught them.

Place aux dames; and first we pay our devoirs to George Sand. This author's notions of poetic (and dramatic) justice are sadly outraged at the issue of the delightful comedy, *As you Like it*. In a long preface to M. Regnier, she explains her notions in detail. Her ladylike sensibility is shocked at the union of the 'sweet Audrey with the sprightly Touchstone, and the devoted Celia with the detestable Oliver.' She in nowise approves of this, and so she alters it altogether. Of course in real life no devoted Celias ever marry detestable Olivers, nor shall they on the stage, at least not on George Sand's stage; she therefore makes our old favourite, the melancholy Jaques, marry the 'devoted Celia.' We shall quote this curious love-scene, and recommend the perusal of the whole play to our readers. They will see what it is possible for such glorious poetry as the speech, 'All the world's a stage,' to become in French prose. But for the last scene of *As you Like it* by George Sand:

SCENE XIII.—CELIA AND JAUQUES.

Celia (to Jaques, seated on her right hand). Adieu, Jaques!

Jaques (trembling). Adieu, madame!

Cel. (retreating, but always looking at him). Adieu!

Jaq. (without regarding her). Adieu. (He buries his face in his hands.)

Cel. (pausing). You then will remain here all alone!

Jaq. And, I ask of you, what should I do elsewhere? Yes, this cabin which you leave is mine. I shall remain there alone, all alone, for the rest of my life, and I shall love nothing but the trees which have seen you pass under their shade, and the grass on which your feet have trod.

Cel. But ere three months have passed, the trees will lose their foliage, and the grass will not preserve for three days the traces of my steps.

Jaq. Go; it is well as it is: I wish to see you

no more. (Celia comes softly behind him, and puts her two hands upon his shoulders—with passionate despair.) What do you want with me?

Cel. Let us go; let us retrace our steps. Give us this hopeless existence, and follow me.

Jaq. No, madame, I have not sold my soul to you: it was dead! But it is reanimated—it lives—it suffers! It would perish bound to your caprices. It belongs to me: I retake it. What does it matter to you? (He passes to the left.)

Cel. What, then, shall I do with mine, if you abandon me?

Jaq. What say you?

Cel. I say that a loyal woman would not take without giving, and that in wishing to take you, I have delivered up myself.

Jaq. Celia! No—you joke! I am no longer young.

Cel. Do you love?

Jaq. I am poor, melancholy—discontented with all things—

Cel. You do not love then?

Jaq. (transported). Ah! hold! you are right. I am young, I am rich, I am gay, I am happy. Yes, yes; the firmament glows above, and the earth flowers below. I breathe with love a new life, and my eyes open to the truth. Who—I melancholy? No; I am no more impious. Heaven is good, men are gentle, the world is a garden of delight, and woman is the angel of pardon (he falls at her feet), if I do not dream that you love me!

Cel. He still doubts. Jaques, by the roses of spring, by the virginity of the lilies, by youth, by faith, by honour, I love you! Now, will you leave me?

Jaq. Never! for I love thee also. Oh! the most beautiful word that man can say: I love thee!

Cel. Ah, well! since my father is neither rich nor powerful—then, thanks to Heaven, I can be yours—am I!

Let our readers compare this sentimental passage with Shakespeare's termination of the play, and say which he likes best—the French or English poet's notion of poetic justice!

We now turn to M. Victor Hugo's translation of the sonnets. We said above that the translator had a theory. He enters into a careful examination of the sonnets—studies them thoroughly—until, as he thinks, he wrests their secret from them; and in accordance with his own view, he makes a complete change in their existing arrangement. He finds in the sonnets a complete drama, 'in which figure three personages—the poet, his mistress, and his friend. There the poet appears, not under the name which the human race gives him, but under that which he received in private life. It is no more William Shakespeare: it is Will whom we see. It is no more the dramatic author who speaks; it is the friend—the lover.' He finds that Shakespeare loved the woman to whom many of these sonnets are addressed, that for a time she coquetted with him, and then, upon the poet's turning round upon her, and threatening her with a 'declaration of war,' she bends to his will; but in the very moment of his victory, he finds that she has another lover, and that that lover is his own bosom-friend. To him the remainder of the sonnets are addressed. He admits that this friend, the W. H. of the dedication, was Henry Wriothesley, Earl of Southampton, and this once acknowledged, our translator says: 'The mystery with which the sonnets were published is easily explained. The Virgin Queen was brought in to make up the *dénouement*. She had forbidden this nobleman to marry, and the poet urges him to marry.' Shakespeare, shewing to Southampton how charming is the woman, said to him: 'Marry!' But the queen, shewing him the Tower of London, said to him: 'Marry not!' Here, then, is the knot of the difficulty untied; here is the key to the mystery furnished. We translate M. Hugo's concluding remarks upon this curious view: 'We understand

now why the publishers, in general rather timid, shewed such little eagerness in publishing the sonnets in which this fatal union had been advised, and in which Shakespeare attacked with so much audacity the celibacy commanded by the queen. It was only after the death of Elizabeth, when the terror inspired by the daughter of Henry VIII. had passed away, that the sonnets of Shakespeare found an editor. But then the high position which Southampton held, and many family considerations, would prevent them from giving to publicity without reserve, the intimate drama in which one of the first personages in England figured. To direct the attention of his contemporaries, the editor imagined the mysterious dedication in which the initials of Henry Wriothesley, Earl of Southampton, were preserved, but inverted: he did better still; he published the sonnets in premeditated disorder, which broke their logical unity, and rendered them almost incomprehensible, leaving to patient posterity the care of divining the enigma. This is the secret which we have now the indiscretion to betray.

This theory of M. Hugo requires a new arrangement of the relation of the sonnets to each other. We shall indicate the complete change this made, when we state that the first sonnet in the French edition is the 135th of the English, and the last in the French answers to the 55th in the English.

The following one, which we copy as a specimen, is the 60th in our editions, and is represented by the 150th in the translation of

VICTOR HUGO.

Comme les vagues qui se jettent sur les galets de la plage, nos minutes se précipitent vers leur fin, chacune prenant la place de celle qui la précédait; et toutes se pressent en avant dans une pénible procession.

La nativité, une fois dans les flots de lumière, monte jusqu'à la maturité et y prend sa couronne. Alors les éclipses tortueuses s'acharnent contre sa gloire et le temps détruit les dons dont il l'avait comblée.

Le temps balaie la fleur de la jeunesse et creuse les parallèles sur le front de la beauté: il ronge les merveilles les plus pures de la création;

Et rien ne reste debout que sa faux ne tranche. Et pourtant dans l'avenir mon vers restera debout, chantant tes louanges, en dépit de sa main cruelle.

And now for

SHAKESPEARE.

Like as the waves make toward the pebbled shore,
So do our minutes hasten to their end;
Each changing place with that which goes before
In sequent toil all forwards do contend.
Nativity, once in the main of light,
Crawls to maturity, wherewith being crowned,
Crooked eclipses 'gainst his glory fight,
And Time, that gave, doth now his gift confound.
Time doth transfix the flourish set on youth,
And delves the parallels in beauty's brow;
Feeds on the rarities of nature's truth,
And nothing stands but for his scythe to mow,
And yet, to times in hope, my verse shall stand,
Praising thy worth, despite his cruel hand.

We cannot conclude this paper more appropriately than by translating the admirable words of M. Lafond, whose introduction contains some of the best things which any Frenchman has ever written upon Shakespeare. He says: 'If there be a man who has painted humanity with all the shades of passion which agitate and attract it whether for good or evil, it is indeed Shakespeare. He is the confessor of human society. Love, jealousy, friendship, hatred, cold policy, ambition, the intoxication of power, the baseness of the courtier, envy, grandeur of soul, the ignorance of the masses, and their inconstant caprices—whatever has made the heart of man beat in all times, unfolds

itself under our eyes in the most vital and striking tableau; and if we wished to attach a proper name to each of these passions, this name would be that of one of the persons of his dramas.'

Surely, after this, it cannot be said that no Frenchman can understand Shakespeare.

O Ç E O L A :

A ROMANCE.

CHAPTER XLVII.—THE CAPTIVE.

LATE as was the hour, I determined to visit the captive before going to rest. My design would not admit of delay; besides, I had a suspicion that, before another day passed, my own liberty might be curtailed. Two duels in one day—two antagonists wounded, and both friends to the commander-in-chief—myself comparatively friendless—it was hardly probable I should escape 'scot-free.' Arrest I expected as certain—perhaps a trial by court-martial, with a fair chance of being cashiered the service.

Despite my lukewarmness in the cause in which we had become engaged, I could not contemplate this result without uneasiness. Little did I care for my commission: I could live without it; but whether right or wrong, few men are indifferent to the censure of their fellows, and no man likes to bear the brand of official disgrace. Reckless as one may be of self, kindred and family have a concern in the matter not to be lightly ignored.

Gallagher's views were different.

'Let them arrist and cashear, an' be hanged! What need you care? Divil a bit, my boy. Sowl, man, if I were in your boots, with a fine plantation and a whole regiment of black nagers, I'd snap my fingers at the service, and go to raisin' shugar and tobaccay. Be St Patrick! that's what I'd do.'

My friend's consolatory speech failed to cheer me; and, in no very joyous mood, I walked towards the quarters of the captive, to add still further to my chances of 'cashierment.'

Like an eagle freshly caught and caged—like a panther in a pentap—furious, restless, at intervals uttering words of wild menace, I found the young chief of the *Baton Rouge*.

The apartment was quite dark; there was no window to admit even the gray lustre of the night; and the corporal who guided me in carried neither torch nor candle. He went back to the guard-house to procure one, leaving me in darkness.

I heard the footfall of a man. It was the sound of a moccasined foot, and soft as the tread of a tiger; but mingling with this was the sharp clanking of a chain. I heard the breathing of one evidently in a state of excitement, and now and then an exclamation of fierce anger. Without light, I could perceive that the prisoner was pacing the apartment in rapid irregular strides. At least his limbs were free.

I had entered silently, and stood near the door. I had already ascertained that the prisoner was alone; but waited for the light before addressing him. Pre-occupied as he appeared to be, I fancied that he was not conscious of my presence.

My fancy was at fault. I heard him stop suddenly in his tracks—as if turning towards me—and the next moment his voice fell upon my ear. To my surprise, it pronounced my name. He must have seen through the darkness.

'You, Randolph!' he said, in a tone that expressed reproach; 'you too in the ranks of our enemies! Armed—uniformed—equipped—ready to aid in driving us from our homes!'

'Powell!'

'Not Powell, sir; my name is Oçeola.'

'To me, still Edward Powell—the friend of my

youth, the preserver of my life. By that name alone do I remember you.'

There was a momentary pause. The speech had evidently produced a conciliating effect; perhaps memories of the past had come over him.

He replied:

'Your errand? Come you as a friend? or only like others, to torment me with idle words? I have had visitors already; gay gibbering fools with forked tongues, who would counsel me to dishonour. Have you been sent upon a like mission?'

From this speech I concluded that Scott—the pseudo-friend—had already been with the captive—likely on some errand from the agent.

'I come of my own accord—as a friend.'

'George Randolph, I believe you. As a boy, you possessed a soul of honour. The straight aspling rarely grows to a crooked tree. I will not believe that you are changed, though enemies have spoken against you. No—no; your hand, Randolph—your hand! forgive me for doubting you.'

I reached through the darkness to accept the proffered salute. Instead of one, I grasped both hands of the prisoner. I felt that they were manacled together: for all that, the pressure was firm and true; nor did I return it with less warmth.

Enemies had spoken against me. I needed not to ask who these were: that had been already told me; but I felt it necessary to give the captive assurance of my friendship. I needed his full confidence to insure the success of the plan which I had conceived for his liberation; and to secure this, I detailed to him what had transpired by the pond—only a portion of what had passed. There was a portion of it I could not intrust even to the ears of a brother.

I anticipated a fresh paroxysm of fury, but was agreeably disappointed. The young chief had been accustomed to harsh developments, and could outwardly control himself; but I saw that my tale produced an impression that told deeply, if not loudly, upon him. In the darkness, I could not see his face; but the grinding teeth and hissing ejaculations were expressive of the strong passions stirring within.

'Fool!' he exclaimed at length—'blind fool that I have been! And yet I suspected this smooth-tongued villain from the first. Thanks, noble Randolph! I can never repay this act of chivalric friendship; henceforth you may command Ogeola!'

'Say no more, Powell; you have nothing to repay: it was I who was the debtor. But come, we lose time. My purpose in coming here is, to counsel you to a plan for procuring your release from this awkward confinement. We must be brief, else my intentions may be suspected.'

'What plan, Randolph?'

'You must sign the treaty of the Oclawaha.

CHAPTER XLVIII.

THE WAR-ORY.

A single 'Ugh!' expressive of contemptuous surprise, was all the reply; and then a deep silence succeeded.

I broke the silence by repeating my demand.

'You must sign it.'

'Never!' came the response, in a tone of emphatic determination—'never! Sooner than do that, I will linger among these logs till decay has worn the flesh from my bones, and dried up the blood in my veins. Sooner than turn traitor to my tribe, I will rush against the bayonets of my jailers, and perish upon the spot. Never!'

'Patience, Powell, patience! You do not understand me—you, in common with other chiefs, appear to misconceive the terms of this treaty. Remember,

it binds you to a mere conditional promise—to surrender your lands and move west, only in case a majority of your nation agree to it. Now, to-day a majority has not agreed, nor will the addition of your name make the number a majority.'

'True, true,' interrupted the chief, beginning to comprehend my meaning.

'Well, then, you may sign, and not feel bound by your signature, since the most essential condition still remains unfulfilled. And why should you not adopt this ruse? Ill-used as you certainly have been, no one could pronounce it dishonourable in you. For my part, I believe you would be justified in any expedient that would free you from so wrongful an imprisonment.'

Perhaps my principles were scarcely according to the rules of moral rectitude; but at that moment they took their tone from strong emotions; and to the eyes of friendship and love the wrong was not apparent.

Ogeola was silent. I observed that he was meditating on what I had urged.

'Why, Randolph,' said he, after a pause, 'you must have dwelt in Philadelphia, that famed city of lawyers. I never took this view before. You are right; signing would not bind me—it is true. But think you that the agent would be satisfied with my signature? He hates me; I know it, and his reasons. I hate him, for many reasons; for this is not the first outrage I have suffered at his hands. Will he be satisfied if I sign?'

'I am almost certain of it. Simulate submission, if you can. Write your name to the treaty, and you will be at once set free.'

I had no doubt of this. From what I had learned since Ogeola's arrest, I had reason to believe that Thompson repented his conduct. It was the opinion of others that he had acted rashly, and that his act was likely to provoke evil consequences. Whispers of this nature had reached him; and from what the captive told me of the visit of the aid-de-camp, I could perceive that it was nothing else than a mission from the agent himself. Beyond doubt, the latter was tired of his prisoner, and would release him on the easiest terms.

'Friend! I shall act as you advise. I shall sign. You may inform the commissioner of my intention.'

'I shall do so at the earliest hour I can see him. It is late: shall I say good-night?'

'Ah, Randolph! it is hard to part with a friend—the only one with a white skin now left me. I could have wished to talk over other days, but, alas! this is neither the place nor the time.'

The haughty mien of the proud chief was thrown aside, and his voice had assumed the melting tenderness of early years.

'Yes,' he continued, 'the only white friend left—the only one I have any regard for—one other whom I—'

He stopped suddenly, and with an embarrassed air, as if he had found himself on the eve of disclosing some secret, which on reflection he deemed it imprudent to reveal.

I awaited the disclosure with some uneasiness, but it came not. When he spoke again, his tone and manner were completely changed.

'The whites have done us much wrong,' he continued, once more rousing himself into an angry attitude—'wrongs too numerous to be told; but, by the Great Spirit! I shall seek revenge. Never till now have I sworn it; but the deeds of this day have turned my blood into fire. Ere you came, I had vowed to take the lives of two, who have been our especial enemies. You have not changed my resolution—only strengthened it; you have added a third to the list of my deadly foes: and once more I swear

—by Wykome, I swear—that I shall take no rest till the blood of these three men has reddened the leaves of the forest—three white villains, and one red traitor. Ay, Omatla! triumph in your treason—it will not be for long—soon shalt thou feel the vengeance of a patriot—soon shalt thou shrink under the steel of Opeola.

I made no reply; but waited in silence till this outburst of passion had passed.

In a few moments the young chief became calm, and again addressed me in the language of friendship.

‘One word,’ said he, ‘before we part. Circumstances may hinder us—it may be long ere we meet again. Alas! our next meeting may be as foes in the field of fight—for I will not attempt to conceal from you that I have no intention to make peace. No—never! I wish to make a request; I know, Randolph, you will accede to it, without asking an explanation. Accept this token, and if you esteem the friendship of the giver, and would honour him, wear it conspicuously upon your breast. That is all.’

As he spoke, he took from around his neck a chain, upon which was suspended the image of the rising sun—already alluded to. He passed the chain over my head, until the glistening symbol hung down upon my breast.

I made no resistance to this offering of friendship, but promising to comply with his request, presented my watch in return; and, after another cordial pressure of hands, we parted.

As I had anticipated, there was but little difficulty in obtaining the release of the Seminole chief. Though the commissioner entertained a personal hatred against Opeola—for causes to me unknown—he dared not indulge his private spite in an official capacity. He had placed himself in a serious dilemma by what he had already done; and as I communicated the purposed submission of the prisoner, I saw that Thompson was but too eager to adopt a solution of his difficulty, easy as unexpected. He therefore lost no time in seeking an interview with the captive chief.

The latter played his part with admirable tact; the fierce, angry attitude of yesterday had given place to one of mild resignation. A night in the guard-house, hungered and manacled, had tamed down his proud spirit, and he was now ready to accept any conditions that would restore him to liberty. So fancied the commissioner.

The treaty was produced. Opeola signed it without saying a word. His chains were taken off—his prison-door thrown open—and he was permitted to depart without further molestation. Thompson had triumphed, or fancied so.

It was but fancy. Had he noticed, as I did, the fine satirical smile that played upon the lips of Opeola as he stepped forth from the gate, he would scarcely have felt confidence in his triumph.

He was not allowed to exult long in the pleasant hallucination.

Followed by the eyes of all, the young chief walked off with a proud step towards the woods.

On arriving near the edge of the timber, he faced round to the fort, drew the shining blade from his belt, waved it above his head, and in defiant tones shouted back the war-cry: ‘Yo-ho-eh-ee!’

Three times the wild signal pealed upon our ears; and at the third repetition, he who had uttered it turned again, sprang forward into the timber, and was instantly lost to our view.

There was no mistaking the intent of that demonstration; even the self-glorifying commissioner was convinced that it meant ‘war to the knife,’ and men were hurriedly ordered in pursuit.

An armed crowd rushed forth from the gate, and

flung themselves on the path that had been taken by the *ci-devant* captive.

The chase proved bootless and fruitless; and after more than an hour spent in vain search, the soldiers came straggling back to the fort.

Gallagher and I had stayed all the morning in my quarters, expecting the order that would confine me there. To our astonishment, it came not: there was no arrest.

In time, we obtained the explanation. Of my two duelling antagonists, the first had not returned to the fort after his defeat, but had been carried to the house of a friend—several miles distant. This partially covered the scandal of that affair. The other appeared with his arm in a sling; but it was the impression, as Gallagher learned outside, that his horse had carried him against a tree. For manifest reasons the interesting invalid had not disclosed the true cause of his being ‘crippled,’ and I applauded his silence. Except to my friend, I made no disclosure of what had occurred, and it was long before the affair got wind.

Upon duty, the *aid-de-camp* and I often met afterwards, and were frequently compelled to exchange speech; but it was always of an official character, and, I need not add, was spoken in the severest reserve.

It was not long before circumstances arose to separate us; and I was glad to part company with a man for whom I felt a profound contempt.

CHAPTER XLIX.

WAR TO THE KNIFE.

For some weeks following the council at Fort King, there appeared to be tranquillity over the land. The hour of negotiation had passed—that for action was nigh; and among the white settlers the leading topic of conversation was how the Indians would act? Would they fight, or give in? The majority believed they would submit.

Some time was granted them to prepare for the removal—runners were sent to all the tribes, appointing a day for them to bring in their horses and cattle to the fort. These were to be sold by auction, under the superintendence of the agent; and their owners were to receive a fair value for them on their arrival at their new home in the west. Their plantations or ‘improvements’ were to be disposed of in a similar manner.

The day of auction came round; but, to the chagrin of the commissioner, the expected flocks did not make their appearance, and the sale had to be postponed.

The failure on the part of the Indians to bring in their cattle was a hint of what might be expected; though others, of a still more palpable nature, were soon afforded.

The tranquillity that had reigned for some weeks was but the ominous silence that precedes the storm. Like the low mutterings of the distant thunder, events now began to occur, the sure harbingers of an approaching conflict.

As usual, the white man was the aggressor. Three Indians were found hunting outside the boundary of the ‘reserve.’ They were made captives by a party of white men, and fast bound with raw-hide ropes, were confined in a log-stable belonging to one of the party. In this situation they were kept three days and nights, until a band of their own tribe hearing of their confinement, hastened to their rescue. There was a skirmish, in which some Indians were wounded; but the white men fled, and the captives were released.

‘On bringing them forth to the light, their friends

beheld a most pitiable sight'—I am quoting from a faithful history—'the rope with which these poor fellows were tied had worn through the flesh; they had temporarily lost the use of their limbs, being unable to stand or walk. They had bled profusely, and had received no food during their confinement, so it may readily be imagined that they presented a horrible picture of suffering.'

Again: 'Six Indians were at their camp near Kanapaha Pond, when a party of whites came upon them, took their guns from them, examined their packs, and commenced whipping them. While in the act, two other Indians approached, and seeing what was going on, fired upon the whites. The latter returned the fire, killed one of the Indians, and severely wounded the other.'

Exasperation was natural—retaliation certain. On the other side, read:

'On the 11th of August, Dalton, the mail-carrier between Fort King and Fort Brooke, was met within six miles of the latter place by a party of Indians, who seized the reins of his horse, and dragging him from the saddle, shot him dead. The mangled body was discovered some days afterwards concealed in the woods.'

'A party of fourteen mounted men proceeded on a scout towards Wachahonta—the plantation of Captain Gabriel Priest—and when within one mile of the place, they came upon a small hommock, through which some of the party declined passing. Four of them, however, dashed into it, when the Indians suddenly arose from ambush, and fired upon them. The two in advance were wounded. A Mr Foulke received a bullet in his neck, but was picked up by those in his rear, and borne off. The other, a son of Captain Priest, had his arm broken, and his horse shot dead under him. He fled, and sinking his body in a swamp, succeeded in eluding the search of the pursuers.'

'About the same time, a party of Indians attacked a number of men, who were employed cutting live-oak timber on an island in Lake George. The men escaped by taking to their boats, though two of their number were wounded.'

'At New River, on the south-east side of the peninsula, the Indians attacked the house of a Mr Cooley—murdered his wife, children, and a tutor engaged in the family. They carried off twelve barrels of provisions, thirty hogs, three horses, one keg of powder, over two hundred pounds of lead, seven hundred dollars in silver, and two negroes. Mr Cooley was absent at the time. On his return, he found his wife shot through the heart with her infant child in her arms; and his two oldest children also shot in the same place. The girl still held her book in her hands, and the boy's lay by his side. The house was in flames.'

'At Spring Garden on the St Johns, the extensive plantation of Colonel Rees was laid waste, and his buildings burnt to the ground. Sugar-cane, sufficient to manufacture ninety hogsheads, was destroyed; besides thirty hogsheads of sugar, and one hundred and sixty-two negroes were carried off. The mules and horses were also taken. The same Indians destroyed the buildings of M. Depeyster, with whose negroes they formed a *leagus*; and being supplied with a boat, they crossed the river, and fired the establishment of Captain Dummett. Major Heriot's plantation was laid waste; and eighty of his negroes moved off with the Indians. Then on towards San Augustine, where the extensive plantations of General Hernandez were reduced to a ruin—next Bulow's, Dupont's of Buen Retiro, Dunham's, M'Rae's of Tomoka Creek, the plantations of Bayas, General Herring, and Bartalome Solano, with nearly every other from San Augustine southward.'

Simple historic facts. I quote them as illustrating the events that ushered in the Seminole war. Barbarous though they be, they were but acts of retaliation—the wild outburst of a vengeance long pent up—a return for wrongs and insults patiently endured.

As yet, no general engagement had taken place; but marauding parties sprang up simultaneously in different places. Many of those who had inflicted outrage upon the Indians were forthwith repaid; and many barely escaped with their lives. Conflagration succeeded conflagration until the whole country was on fire. Those who lived in the interior, or upon the borders of the Indian reserve, were compelled to abandon their crops, their stock, their implements of husbandry, their furniture, and indeed every article of value, and seek shelter within the forts, or concentrate themselves in the neighbouring villages, around which stockades were erected for their better security.

The friendly chiefs—the Omatlas and others—with about four hundred followers, abandoned their towns, and fled to Fort Brooke for protection.

The strife was no longer hypothetical, no longer doubtful; it was declared in the wild *Yo-ho-chee!* that night and day was heard ringing in the woods.

CHAPTER L.

TRACING A STRANGE HORSEMAN.

As yet but few troops had reached Florida, though detachments were on the way from New Orleans, Fort Moultrie, Savannah, Mobile, and other depôts, where the soldiers of the United States are usually stationed. Corps of volunteers, however, were being hastily levied in the larger towns of Georgia, Carolina, and Florida itself; and every settlement was mustering its quota to enter upon the campaign.

It was deemed advisable to raise a force in the settlements of the Suwanee—my native district—and on this duty my friend Gallagher was despatched, with myself to act as his lieutenant.

Right gladly did I receive this order. I should escape from the monotonous duties of the fort garrison, of which I had grown weary enough; but what was a still more pleasant prospect, I should have many days at home—for which I was not without longing.

Gallagher was as overjoyed as myself. He was a keen sportsman; though, having spent most of his life within the walls of cities, or in forts along the Atlantic seaboard, he had found only rare opportunities of enjoying either the 'fox-chase' or 'deer-drive'. I had promised him both to his heart's content, for both the game and the 'vermin' were plentiful in the woods of the Suwanee.

Not unwillingly, therefore, did we accept our recruiting commission; and, bidding adieu to our companions at the fort, set out with light hearts and pleasant anticipations. Equally joyous was Black Jake to get back once more to the 'ole plantayshun.'

In the quarter of the Suwanee settlements, the Indian marauders had not yet shewn themselves. It lay remote from the towns of most of the hostile tribes, though not too distant for a determined foray. In a sort of lethargic security, the inhabitants still remained at their houses—though a volunteer force had already been mustered—and patrols were kept in constant motion.

I had frequent letters from my mother and Virginia; neither appeared to feel any alarm: my sister especially declared her confidence that the Indians would not molest them.

Withal, I was not without apprehension; and with so much the greater alacrity did I obey the order to proceed to the settlements.

Well mounted, we soon galloped over the forest

road, and approached the scenes of my early life. This time, I encountered no ambuscade, though I did not travel without caution. But the order had been given us within the hour; and having almost immediately set forth, my assassin-enemies could have had no warning of my movements. With the brave Gallagher by my side, and my stout henchman at my back, I dreaded no open attack from white men.

My only fear was, that we might fall in with some straggling party of red men—now our declared enemies. In this there was a real danger; and we took every precaution to avoid such an encounter.

At several places we saw traces of the Indians nearly fresh. There were moccasin prints in the mud, and the tracks of horses that had been mounted. At one place we observed the debris of a fire still smouldering, and around it were signs of the red men. A party had there bivouacked.

But we saw no man, red or white, until we had passed the deserted plantation upon the creek, and were approaching the banks of the river. Then for the first time during our journey a man was in sight.

He was a horseman, and at a glance we pronounced him an Indian. He was at too great a distance for us to note either his complexion or features; but the style of dress, his attitude in the saddle, the red sash and leggings, and above all, the ostrich-plumes waving over his head, told us he was a Seminole. He was mounted upon a large black horse; and had just emerged from the wood into the opening, upon which we had ourselves entered. He appeared to see us at the same time we caught sight of him, and was evidently desirous of avoiding us.

After scanning us a moment, he wheeled his steed, and dashed back into the timber.

Imprudently enough, Gallagher put spurs to his horse and galloped after. I should have counselled a contrary course; but that the belief was in my mind that the horseman was Opeola. In that case, there could be no danger; and from motives of friendship, I was desirous of coming up with the young chief, and exchanging a word with him. With this view, I followed my friend at a gallop—Jake coming on in the rear.

I was almost sure the strange horseman was Opeola. I fancied I recognised the ostrich-plumes; and Jake had told me that the young chief rode a fine black horse. In all likelihood, then, it was he; and in order to hail, and bring him to a halt, I spurred ahead of Gallagher—being better mounted.

We soon entered the timber, where the horseman had disappeared. I saw the fresh tracks, but nothing more. I shouted aloud, calling the young chief by name, and pronouncing my own; but there was no reply, save the echo of my voice.

I followed the trail for a short distance, continuing to repeat my cries; but no heed was given to them. The horseman did not wish to answer my hail, or else had ridden too far away to understand its intent.

Of course, unless he made a voluntary halt, it was vain to follow. We might ride on his trail for a week without coming up with him. Gallagher saw this as well as myself; and abandoning the pursuit, we turned once more towards the road, with the prospect of soon ending our journey.

A cross-path, which I remembered, would bring us by a shorter route to the landing; and for this we now headed.

We had not ridden far, when we again struck upon the tracks of a horse—evidently those made by the horseman we had just pursued, but previously to our having seen him. They led in a direct line from the river, towards which we were steering.

Some slight thought prompted me to an examination of the hoof-prints. I perceived that they were wet—water was oozing into them from the edges; there was

a slight sprinkling of water upon the dead leaves that lay along the trail. The horseman had been swimming—he had been across the river!

This discovery led me into a train of reflection. What could he—an Indian—want on the other side? If Opeola, as I still believed, what could *he* be doing there? In the excited state of the country, it would have been risking his life for an Indian to have approached the Settlement—and to have been discovered and captured would have been certain death. This Indian, then, whoever he was, must have some powerful motive for seeking the other side. What motive? If Opeola, what motive?

I was puzzled—and reflected; I could think of no motive, unless that the young chief had been playing the spy—no dishonourable act on the part of an Indian.

The supposition was not improbable, but the contrary; and yet I could not bring myself to believe it true. A cloud had swept suddenly over my soul, a presentiment scarcely defined or definable was in my thoughts, a demon seemed to whisper in my ears: *It is not that.*

Certainly had the horseman been across the river? Let us see!

We rode rapidly along the trail, tracing it backwards.

In a few minutes it guided us to the bank, where the tracks led out from the water's edge. No corresponding trail entered near. Yes, he had been across.

I plied the spur, and plunging in, swam for the opposite shore. My companions followed without asking any questions.

Once more out of the river, I rode up the bank. I soon discovered the hoof-marks of the black horse where he had sprung off into the stream.

Without pausing, I continued to trace them backwards, still followed by Gallagher and Jake.

The former wondered at my eagerness, and put some questions, which I scarcely answered coherently. My presentiment was each moment growing darker—my heart throbbed in my bosom with a strange indescribable pain.

The trail brought us to a small opening in the heart of a magnolia grove. It went no further. We had arrived at its end.

My eyes rested upon the ground with a sort of mechanical gaze. I sat in the saddle in a kind of stupor. The dark presentiment was gone, but a far darker thought occupied its place.

The ground was covered with hoof-tracks, as if horses had been halted there. Most of the tracks were those of the black horse; but there were others of not half their dimensions. There was the tiny shoe-mark of a small pony.

'Golly! Massar George,' muttered Jake, coming forward in advance of the other, and bending his eyes upon the ground; 'looker dar—dat am tha track ob de leetle white Fox. Missa Vaganny's been hya for sartin.'

THE CITY OF LONDON.

THE long-promised measure for the reform of the corporation of the city of London has recently been brought forward in the House of Commons; and perhaps this may be a suitable time for giving to our readers a sketch of that great corporation, which has hitherto successfully resisted all the attempts that have been made for its reformation, and which has had influence enough, even at the last, to turn away, in a great measure, the destruction which threatened its cherished privileges.

The antiquity of London is undoubtedly very great: it is mentioned by Tacitus as a 'great mart of trade and commerce;' but the corporation, unlike most of the other municipal corporations of the

kingdom, has no definite constitutional charter at all; its rights result from a series of royal grants or charters, from statutes of the realm, and from orders and ordinances of the courts of aldermen and common council. The Anglo-Saxon law of King Athelstan mentions it; and though we do not find it named in Domesday-book, yet a charter of William the Conqueror, addressed to the bishop, the 'Portgerefa,' or chief-magistrate, and the 'Burghwara,' or burghers, recognises it as a city. This is the earliest charter in the possession of the city, the latest is one granted by George II., in the fifteenth year of his reign; and the total number of charters amounts to 120. The boundaries of the city were fixed at a very early period; and the area enclosed by them, as compared with the metropolis generally, is very small; the former comprises little more than a square mile; while that of the latter is, from north to south, about eleven miles; and from east to west, about sixteen miles, or about 176 square miles. Within the last fifty years, the metropolis has nearly doubled its population, the city remaining almost stationary. Besides the city, properly so called, the corporation has exercised a certain jurisdiction over the borough of Southwark. This was granted in the year 1857, in consideration of a yearly rent of L.10. They hold courts-leet for the borough, appointing the steward and other officers, including the high-bailiff and coroner. They also go through the form of holding quarter-sessions. A grand jury is impanelled, and are addressed to this effect: 'Gentlemen, by virtue of certain charters, we have been obliged to call you together; we are happy to tell you there is nothing for you to do.' Then the jury say: 'Why did you then call us together?' The answer given by the late recorder, Mr Law, was: 'Surely it is better to call you together and say: "Now you may go home," than to keep you here two or three days.' This jurisdiction the new bill proposes entirely to do away with, and for the future the borough of Southwark will be constituted in all respects like the other metropolitan boroughs.

The city of London is governed by a lord-mayor, a court of aldermen, and a court of common council, whose full title is, 'The Lord-mayor, Aldermen, and Commoners of the City of London.' The lord-mayor is elected annually; and the form of his election is for the livery in common hall assembled, which is composed of the members of the different city companies, who are also citizens, to nominate two of the aldermen who have served the office of sheriff—usually the two senior ones below the chair—and for the court of aldermen to select one of those presented by the livery. The lord-mayor is the chief-magistrate of the city, is a member of the privy council, though it is doubtful whether he can take his seat, except upon the demise of the crown; and he has an allowance of L.10,000 assigned to him out of the revenues of the city, together with the official residence of the Mansion House, to enable him to keep up the accustomed state and hospitality of the city. The aldermen are twenty-six in number: one elected by each ward of the city, and one for a ward which has now ceased to exist, and to which the senior member of the court usually succeeds by rotation. When elected, they remain in office for life. The title of alderman may be traced back as early as the time of Henry II.; but being a Saxon term, it has probably existed much longer. Each alderman has the government of the ward for which he is elected; and in ancient times, the Watch, then an efficient body, was under his command; and he bore his coat of arms and banner as a baron. The aldermen are all justices of the peace, and attend in rotation the police-courts of the city, and are named in the commission of the central criminal court. They assemble together, and form a court of their own,

but are also members of the court of common council, and ex officio governors of the royal hospitals. The court of common council consists of two hundred and six members, also elected by the different wards, though only for one year, like the popular representatives under every constitution. This court is now the most important, their principal function being their unlimited command over the funds of the city. The court is presided over by the lord-mayor, who has power to dissolve a meeting at any time, by ordering the sword-bearer to take up the sword. The sheriffs are two in number, the shrievalty of London and Middlesex being united in one office. They are elected by the livery in common hall, and not appointed by the crown, as is the case in all other counties. A fine of L.400 is imposed on a person refusing to serve the office; and the sum obtained by the levying of these fines during the first fifty years of the present century, amounted to more than L.86,000. The corporation has several important officers of its own, the recorder being the chief: his duties are chiefly judicial; and by him the city appears whenever any of its customs are called in question. The common serjeant, who is the counsel for the city, also sits as a judge in some of the courts; and the chamberlain, who is the treasurer of the city funds, likewise holds a position of importance and emolument: his office is generally considered as a kind of provision for demoted aldermen.

The funds of the corporation are very large, the revenue for the year 1863 amounting to L.551,971, 8s. 4d. It is derived from the rents of the city's landed estates and house-property, from street-tolls, the coal-duty, the metage of corn, fruit, &c., the harbour-dues of the port of London, and the various rates assessed on the inhabitants. The city has also large estates in the north of Ireland, which they acquired by a grant from the crown in the time of James I. That district was then in a most unsettled and disaffected state, and the rebellion of the Earls of Tyrone and Tyrconnel had caused large forfeitures of land there. The king wishing to repeople this part of his dominions, the corporation undertook to settle it at their own expense. Large estates were allotted to each of the companies who had contributed, and the property has continued to be managed by a committee of the corporation. Its revenues are applied partly in grants to the municipal institutions of Londonderry, and partly to charitable and educational purposes in the districts around that town and Coleraine.

The city of London has the power of levying tolls on certain articles, and exercises some other rights corresponding very much with the custom-duties levied by the crown. It claims the right to measure all corn landed within its jurisdiction, and for this, some small toll is charged. It is compulsory; and the city uses its own bushel for the purpose. The exercise of this right alone adds about L.10,000 a year to the revenues; it also extends to all fruit imported from abroad, and all sea-borne oysters. A toll of twopence upon all carts entering the city which do not belong to citizens, is also levied; and this comparatively small toll produces in the course of the year more than L.5000. The city exercises jurisdiction over the navigation of the Thames, from Staines in Middlesex, to Yantlet Creek, in Kent; and these metage rights extend not only to goods landed within the limits of the city, but also to goods landed anywhere within its jurisdiction. The conservancy of the Thames also belongs to the lord-mayor, and has some valuable rights attached to it. There was formerly a metage-duty upon coal, but this has been commuted into a fixed duty on the ton. There are now three duties imposed upon all coal imported either by land or water into a district extending

within a circle of twenty miles from the General Post-office, of the several amounts of one penny, fourpence, and eightpence per ton. The net produce of the three branches of coal-duty in 1852 was L.179,857; but upon this some heavy charges exist, and in the same year the city only was able to apply L.15,805 to its own use. All persons acting as brokers within the city must be admitted by the court of aldermen; and an annual payment of L.5 from each is required; also, no one can exercise any retail trade who is not free of the city; and upon admission to the freedom, a fine is imposed. These are some of the principal rights and privileges now exercised by the corporation of London; and with the exception of the coal-tax, which it is proposed to retain at present, they are all abolished by the new bill.

Some great changes will also be introduced into the constitution of the corporation itself: the number of aldermen will be reduced to sixteen, and their separate court altogether abolished; the number of common councilmen will also be lessened, and they with the aldermen will form only one court; but to them will be intrusted the election of all officers, including the lord-mayor; and for that office all citizens with a small property qualification will be eligible. The aldermen still retain their places as police magistrates, but they and the lord-mayor will cease to sit in the central criminal court.

These are the most important provisions of this bill, the object of which is to administer to the city of London that measure of reform which the other municipal corporations of the kingdom underwent in the year 1835, but which London at the time avoided. At present, nothing seems to have been attempted but the remedy of its most pressing defects.

NANA SAHIB.

As we have no doubt that many of our readers would be glad to be acquainted with the parentage and other antecedents of the man who bears this blood-stained name, we propose, in the present article, to give a brief sketch of him.

Nana Sahib, Rajah of Bithoor—whose correct name is Sree Munt Dhoondoo Punt—is the eldest son, by adoption, of the late Badjee Rao, ex-Peishwa of the Mahrattas.

For many years previous to his death, Badjee Rao had been a dethroned pensioner of the East India Company. When in the fulness of his power, he had, as a native prince, assisted the East India Company in their war against Tippee Sahib, the tiger of Seringapatam; and, as a reward for his doing so, the Company, after years of strife with him—after negotiations and exactions, and treaties, and violations of these treaties on their part—contrived, in 1817, to get hold of his dominions. After numerous and fierce conflicts, Badjee Rao, at the head of 8000 men, and with an advantageous post, was prepared to do battle for the sovereignty of the Deccan; when Brigadier-general Sir John Malcolm, who commanded the British army, sent a flag of truce to him, with proposals for a surrender.

The proposals made on the part of Sir John Malcolm were, that Badjee Rao, the Peishwa of the Mahrattas, should renounce his sovereignty altogether; that he should come, within twenty-four hours, with his family and a limited number of his adherents and attendants, into the British camp; that they should there be received with honour and respect; that he should be located in the holy city of Benares, or in some other sacred place of Hindostan; that he should have a liberal pension from the East India Company for himself and his family; that his old and attached adherents should be provided for;

and that the pension to be settled upon himself and his family should not be less than eight lacs of rupees—that is, L.80,000 per annum.

After long and anxious deliberation with his prime minister and other great officers of state, the Peishwa accepted these proposals—went with his family and adherents into the British camp—and Bithoor was afterwards assigned as his residence. The East India Company, with their usual grasping and illiberal spirit of covetousness, were displeased with Sir John Malcolm for his granting these terms. But they, and the governor-general, Lord Hardinge, could not recede from them; and they took care to limit the stipulated allowance to the smallest sum mentioned in the treaty—namely, eight lacs of rupees, or L.80,000 per annum.

We have stated that the pension was to be conferred upon Badjee Rao and his family. Now, before we proceed further, we must mention, that by the Hindoo Shasters, or scriptures, there is a fearful doom awarded against those who die childless; that doom is, the being consigned, after death, to 'a place called Put, a place of horror, to which the manes of the childless are supposed to go, there to be tormented with hunger and thirst, for want of these oblations of food and libations of water, at prescribed periods, which it is the pious, and indeed indispensable duty of a living son to offer.'

Such are the principles of the Hindoo religion with regard to the want of natural male issue. Now, the same principles, in order to remedy the defect, permit the system of adoption where natural issue fails. It was in accordance with this that Badjee Rao, in his old age, finding himself naturally childless as to male issue, by his will declared Nana Sahib to be his eldest son, heir, and representative.

In his day, Badjee Rao, as chief of the powerful Mahratta nation, had been a great sovereign. He survived his downfall—exercising civil and criminal jurisdiction, on a limited scale, at Bithoor—thirty-five years. On the 28th of January 1851, he died.

No sooner was his death made officially known, than Lord Dalhousie tabled a minute at the council board of Calcutta, ruling that the pension, expressly guaranteed to the great Badjee Rao, and his family, should not be continued to the latter. Nana Sahib, Badjee Rao's widow, and the other members of his family, were naturally stricken with grief and terror. They saw themselves reduced to poverty. They had no other pecuniary resource than some trifling sum which Badjee Rao had left behind him.

On the 24th of June 1851, Nana Sahib forwarded a memorial to the lieutenant-governor of the North-west Provinces of India on the subject. In reply, he was told that the pension could not be continued, but that a certain tract of land would be his for life. The commissioner of Bithoor, a public officer of high rank and standing, and who knew the circumstances and claims of the ex-Peishwa's family, forwarded an urgent appeal on their behalf; but, in a letter from the secretary of the governor-general, of date September the 24th, 1851, he received a severe reprimand for so doing. His recommendation was stigmatised as 'uncalled for and unwarrantable.'

After some further efforts in India, Nana Sahib addressed the Court of Directors, at Leadenhall Street, in England. His appeal to them was dated the 29th of December 1852.

In the eyes of the East India Company, the appeals of native princes of India do not seem to have been matters of much consequence. The Company appear to have considered that it added to their dignity to have the advocates of such princes waiting in their

anterooms. Somewhere about December 1853, the Company sent back Nana Sahib's memorial to the government in India, and the result was, that nothing was done.

It would appear that Nana Sahib, with smooth and gentlemanly manners, unites superior abilities; and that to these abilities he adds passions of the strongest and most vindictive nature. His spirit is high, and his vehemence of the most determined character. At the period of the breaking out of the mutiny which has rendered his name infamous, he seems to have become a monomaniac on the subject of what he believed to be his wrongs.

In the preceding sketch, subject, of course, to correction, we have endeavoured to state facts, not with a view to advocating any cause, but simply for the purpose of communicating to our readers information as to some of the numerous causes which have led to the dreadful events which have recently occurred in the East.

[We have been informed that an Oriental named Azimullah was in London in 1855, for the purpose of making a last appeal in behalf of his employer, Nana Sahib. He lodged in a respectable private hotel in George Street, Hanover Square, where a friend of ours, living in the same house, formed his acquaintance, was entertained by him in gentlemanlike style at dinner, and found him a well-bred, agreeable person, of good intelligence about English matters. Our friend, on lately revisiting the house, learned from its proprietor that the polite Azimullah, before departing from England, shewed symptoms of a moody and soured feeling, and let fall several hints to the effect that England would yet regret the manner in which it had used his master. This same Azimullah has since appeared in the dismal transactions connected with the destruction of the Cawnpore garrison.—Ed.]

AN EXECUTIONER'S LITTLE BILL.

THE following notice of the doings of the hands of justice, in a neighbouring country, in the year 1712, may not be without some historic interest; and certainly it is calculated to make one rather contented than otherwise with the state of Europe in 1858. In the year 1712, it was the custom in Amsterdam to make use of the services of an executioner from the neighbouring town of Haarlem; and in order to avoid the expense of repeated journeys, the worthy magistrates contrived that the various sentences of the criminal law should be carried out as much as possible on the same day. The following is the little bill of the Haarlem Calcraft for the work of a single day:

AMSTERDAM, Dec. 17, 1712.

To account for business done.

	Florins.
To one beheaded,	6
Item for the use of the sword of justice,	3
Item for the cloth,	3
Item for the coffin,	3
To one strangled,	6
Taken down and put into the coffin,	3
To one put on the wheel, with nine strokes, at 3 gulden the stroke,	27
For the strangling,	6
Taken down and carried out of the town,	9
To two hanged with a sword over their heads,	18
One taken down, and carried out of the town,	9
One taken down,	3
To four hung on the gallows, at 6 gulden apiece,	24
One with a sword over the head,	3
Two with letters on their breast,	12
To four-and-twenty scourged, at 3 gulden apiece,	72
Three with the sword over their heads,	9

One fettered, and set in the pillory,	6
One branded on the back,	6
Item wages,	12
Item road-money,	12
Item for the use of the rope,	12
Item for the assistant,	12
Amount,	276

All this, we repeat, was the work of a single day, and it came off in one public place—before the town-house of Amsterdam. The account seems to have suggested to the citizens of the time merely that the hangman-business was a thriving one (*dat zulk eene executie eene goede neering zy*). To us in our day and generation, it is an interesting document, as a fragment, and a genuine one, of the history of those days which people in Holland and Germany, and some other parts of the world too, are wont to call 'the good old times.'

AN OLD MAID'S RETROSPECTIONS.

I LOOK into the dreamy past, and see—what do I see? They look like visions now, but *then*, how real were they to me!

I see my girlhood full of hope, my lover true and brave; In fancy still I hear his vow, as a pledge of truth he gave. It was a ring: he smiling said: 'Twill serve to guard the space

Upon thy finger, till I put another in its place.' That first love-gift, see, here it is—Oh, what a slender band

Though tethered by a golden chain to this poor withered hand.

And it was in that girlish time when I perchance might see

A youthful mother's glance of pride at the babe upon her knee,

I envied her that happiness, and oh, my heart beat wild That I might one day be the matron mother of his child. 'Twas woman's nature in me spoke; but scarcely had the thought

Been formed, ere maiden pride and shame a mingled colour brought:

Vain was the guiltless blush, for though these hopes of mine might seem

So near fulfilment then, alas, they proved indeed a dream.

Too poor to wed, my lover true, left his own native strand, Thinking to win a home for me in a far distant land.

Years passed: he wrote that silver threads were mingling with his hair.

They were in mine—those fruits, from seed sown by the hand of Care.

Now, whiter than the snow-clad hill, or foam that crests the wave,

Are my thin locks; his weary head rests in a foreign grave.

Ay, maidens, you may sigh; God grant that happier be your lot;

For me, no power could make me wish this true-love dream forgot.

But after all my pains, my fears, my visions of the past, One ever-present hope of mine will be fulfilled at last;

And I am happy, for I know my bridal draweth nigh—A union, purer, holier far in realms beyond the sky.

In every dream by night and day I hear again his voice; I fancy that he beckons me, and calls me to rejoice;

That, when my eyes to earth are closed, my truly-loved will be

The first by the Eternal sent to meet and welcome me.

PRICE 1^d.

POLITICAL ECONOMY.

Men of science are rarely popular characters. Without incurring, as a general rule, much dislike or ill-will from their neighbours, they are not usually favourites, either individually or as a class. They are sometimes objects of a not very friendly curiosity, sometimes of what very nearly approaches to contempt, on the part of the vulgar. The gentleman whose days are spent in roaming over hill and dale in search of a small fern or a rare species of grass, is considered by the wondering rustics to be wasting his time in a strange kind of busy idleness. The chemist's housemaid can barely refrain from despising, while she pities, the master whose life is spent in a close room, amid glass bottles and bad smells. The conventional type of the scientific student, as we find him in novels and in the minds of novel-readers, is generally a subject for good-humoured pity or sarcastic ridicule. Spectacles, a shabby coat, and an unclean shirt-collar, are his outward apparel; the inner man is clothed in stolid indifference to the fate of mankind, and wrapped in devotion to the study of butterflies or the calculation of logarithms. But certain classes of scientific men are liable to yet worse treatment. As each department of knowledge is rescued from the domain of prejudice and conjecture, and made the subject of systematic inquiry, a persecution, social if not legal, is sure to be the doom of the adventurous investigator. So it was in the days of Galileo with the astronomers; so it has been, in more recent times, with the anatomists, whose practice of dissection drew down upon them a storm of popular execration which has hardly yet subsided. But perhaps no science was ever more unpopular, and no body of philosophical writers ever so heartily abused and decried, as political economy and the political economists. Among the vulgar and ignorant of all ranks, indeed, the very name of political economy excites a shout of ridicule or a smile of contempt. Among more earnest and more observant people, there is often found a spirit of bitter and irrational hatred towards this obnoxious science, which argues a strong though unacknowledged suspicion of its truth and importance. The wholly ignorant may indeed sneer at what they cannot understand; but men revile generally what they fear. And there is a certain class of men, prejudiced, obstinate, ill-informed, but earnest and philanthropic withal, to whom the name of economical science is indeed a sound of terror, and in whose eyes an economist is an intolerable abomination. They hate the science, because it reveals to them stern laws and stubborn facts: laws, to which their

systems must, on pain of failure, conform; facts, by which their best laid schemes for the improvement and elevation of mankind must often be baffled and overthrown. Starting in horror from the vision, they turn indignantly upon the prophet, and charge him with an attempt to deceive them—not because they have detected any error in his demonstrations—not because they can convict him of ignorance or misrepresentation—but simply because he would not 'prophecy unto them smooth things.' They accuse him of harshness, selfishness, cruelty, as if he had created the laws which he explains. They denounce him as indifferent to human wretchedness, because he points out the sources from which wretchedness has arisen, and from which, so long as they are suffered to exist, it must continue to arise. And their outcry is echoed by thousands, who are too ignorant to know what it is they are criticising, and too indolent for the labour of mastering a new and difficult study. It does not seem to strike these gentlemen, that, after all, they are only, as the American critic says, 'screaming at the calm facts of the universe.' As little does it occur to the herd of clamourers to inquire into the nature, the purpose, and the sources of the science they denounce and reject.

Political economy is, in very truth, the science of philanthropy. It is the study of human welfare, so far as that welfare depends upon material prosperity—the investigation of the means by which nations attain to wealth, and classes to comfort. It is the exposition, in a word, of those laws of nature which regulate the material condition of communities and individuals—of the causes on which depends the question, whether this man or that body of men shall or shall not have enough to spare of this world's gear—shall or shall not enjoy their fair share of this life's blessings. It is the science which shews how material good may be wrought, and social amelioration effected—which teaches us what objects can be achieved for mankind by human efforts, and in what manner and by what means those objects can be attained. It is perfectly true that it deals only with the grosser conditions of happiness. Except in so far as they bear on those conditions, it leaves education to the schoolmaster, and morality to the pastor. These are no more within the province of the economist, than within that of the physician or the astronomer: his business is simply to explain what are the laws of nature relative to the material wellbeing of mankind, not to discuss the comparative importance of material and moral advancement, or the effect of wealth upon

the intellect and virtue of men and nations. His office is not to teach how men are to be made wise or good; but how they may be supplied with food and raiment. It is not his function to aid and to advise the clergyman or the moralist, but to guide the labours and enlighten the path of the practical philanthropist and the social reformer.

Such being the nature and such the functions of political economy, it is obviously incumbent on every one who aspires to confer immediately solid benefits on his fellow-men, to improve their material condition, to study carefully the laws upon which that condition depends. The physician does not attempt the cure of physical suffering without cautious study, not merely of the individual disease, but of all the ills that flesh is heir to. His youth is a long training in the knowledge of the human frame; he has made himself acquainted with every part of its wonderful mechanism; he has made himself familiar with all its operations; he knows the laws which regulate those operations, and the disturbances to which they are liable. Not until he has acquired this knowledge, not until he has been qualified for the task by this course of laborious study, is he intrusted with the care of patients and the cure of disease. The empiric who disdains this preparation or shrinks from this toil, lays hold of some nostrum, and vaunts it to the world as an infallible remedy for all corporeal diseases. He finds credulous listeners: perhaps he manages to kill a few of them; but for so doing he is liable to severe legal punishment, if his victims have friends more sceptical than themselves. Unhappily, the quack who practises on the social body, is liable to no such penalties: no course of study is thought necessary for him; to see evil, and to be anxious to redress it, is esteemed a sufficient qualification. The results of this empirical philanthropy are every day made manifest in some new form of disastrous blundering. The zealous friends of some distressed class are anxious to alleviate their sufferings—often intolerably severe—sometimes aggravated by gross oppression or neglect on the part of others. Work is terribly hard; wages are shamefully low. These grievances must be redressed; an association is formed, and public meetings are called on behalf of the sufferers. Facts and incidents of appalling distress are brought to light, and humanity is shocked, and benevolence terrified by the revelation. Subscriptions are poured in; a committee is formed; aid is freely given. How is it that distress is so rarely cured? Relieved for the time it may be; but neither public benevolence nor legislative interference can permanently eradicate it; and the earnest and large-hearted men who have been striving for its cure, turn away in sickness of heart, and, according to their temper, marvel at the failure of their labours, or curse political economy, and those who warned them that such failure was all they had to expect. They had set to work with an utter ignorance and disregard of the only method in which their objects could possibly be attained. They had cut off the head of the weed, and left the root in the soil; what wonder that it soon sprouted afresh? They had repressed the symptoms of the disease; they had cooled the fevered skin, and healed up the unsightly sore; but they had not even touched the seat of the evil: they were utterly ignorant of its real nature. Can they marvel if the patient died under their hands? The physician stood by their side, and warned them: they would not hear him. They believed that all social suffering was the result of human wrong, and might be amended by human justice and charity. They obstinately refused to learn that the social condition of mankind depends, in great part, upon laws as certain as those which regulate the motions of the planetary bodies;

that poverty, squalor, starvation, are evils which charity alone can no more eradicate, than it can prevent typhus fever or cholera. Social evils and physical diseases alike may be alleviated or averted by a careful attention to the warnings of science: neither can be mitigated or extirpated by any other means. The laws of social economy are not less certain than those of medical science. It is certain that when in any place population is overcrowded, that place will be unhealthy. It is certain that when in any trade there are more labourers than suffice for the work, there will be low wages, hard work, scant food. These things must be. We cannot remove them by denying them. What wisdom and goodness can do, is only to recognise the consequence, and to attempt the eradication of the cause.

The reason, then, of the unpopularity which attaches to the name of political economy, is simply the popular aversion to painful truths. This aversion manifests itself in an obstinate reluctance to recognise the disagreeable fact, and an angry denunciation of those who enforce its claim to attention. The economist demonstrates to the poor that their poverty arises mainly from causes altogether beyond the control of legislature or aristocracy; and he is denounced as a partisan of existing evil by every agitator whose pet theme is the injustice and oppression of the rich. He explains to the ill-paid labourer that wages are not dependent on the caprice of the employer, but on the condition of the labour-market; and he is hated as an ally of the master and an enemy of the men. He sets forth calmly the nature of the social machinery which regulates the adjustment of supply and demand; and he is cursed by the socialist visionary as the advocate of that terrible ogre and bugbear—Competition. It would surprise many of those who delight in reviling what they are too impatient to study, were they informed that the ablest and most impartial summary of communistic theories and aspirations ever given to the world is contained in an economical treatise by one of the greatest living masters of the science. But Mr John Stuart Mill takes care distinctly to explain what may, and what may not, be hoped from any improvements in the organisation of industry. He indulges in no visions, and gives vent to no rhapsodies. The dreamer revels in a socialistic paradise; the economist points out not only by what steps that vision may be realised, if its realisation be possible, but how many evils there are which no such realisation would remove, and what its actual worth and value would be. But dreamers are ill-pleased with those who thus criticise their illusions; they cannot endure the man who coolly weighs the gold and tests the jewels of their fairyland. It is to the man who is intent rather on doing good than on dreaming of it, that political economy appeals. To him it indicates the means of beneficence; it realises the intentions of the philanthropist, and teaches him how to be charitable without being a patron of vice, and how to make his benevolence a permanent blessing to others, rather than a present gratification to himself. Men who are anxious rather for the praise and pleasure of generosity than for the solid results of beneficence, cannot be expected to study such a science, or to walk by its precepts. Men who, like the ostrich, think to evade the laws of nature by blinding their eyes to their operation, may loudly denounce the exponent of truths unwelcome to them. So in Galileo's day was the revolution of the earth on its axis condemned as heresy, and persecuted as blasphemy. 'Still it does move,' in spite of the inquisitors; and still, in spite of its unpopularity, political economy continues to be a science, and the laws of nature, which it is the function of that science to explain, continue to operate. Only by regarding those laws is there hope of effecting any permanent

improvement in the condition of any class or community; and while they are disregarded, the more good is attempted, the more evil is likely to result. Truth is strong, however; and the economists may appeal with confidence to Time for the justice which popular caprice now denies them, and for the respect due to those who have conscientiously laboured at a task harsh, indeed, and ungrateful, but second to none in human interest, or in importance to humanity.

THE OLD BABY.

TAKING advantage of the facilities afforded by the last transatlantic invention, the Thought-reflector—a boon indeed to those who are too idle, or incompetent, to express their ideas in speech, and a very great improvement upon the rude copying-machine which could only reiterate mere words—I venture to submit to a discerning public the grievance under which not I alone, but the vast majority of my fellow-infants are labouring. Few and favoured are those children-in-arms who have no cause to range themselves under my banner. Blessed is the babe whose parents have preserved the unities in never associating with it a rival and a usurper. Happy indeed is that exceptional infant who has never yet been stigmatised as the Old Baby.

I was born of the masculine gender, with a bald head, like Sir John Falstaff, and partycoloured, precisely three hundred and sixty-four days ago. To-morrow, at 4:30 in the morning, to an instant, I shall have arrived at a year, if not of discretion, at least of human experience. I shall be 'going on' for two years old. This consideration by no means intoxicates me with a boastful joy. To live, as I have already learned, alas! is but another name for to suffer. In this little span of life, what vicissitude of fortune have I even now endured! How Time's inevitable yoke has bowed my little neck and pressed my chin into my bib! I would that it had been permitted to me to remain for ever lobster-red, spotty, fishy-eyed, habitually or with the rarest exceptions naked, cross, smiling (with the wind, and not with joy), exclusively confined to a milk-diet—rather than have grown to what I have become. Where are the comforts of my youth?—the warm soft sponges which were wont to dab me daintily, the scented powders which were scattered over my then respected person, the bottles with soothing liquids that welled through the softest channels to my toothless but far from unappreciating guma. 'Whither are they fled, the glory and the dream?' Where are now the gorgeous habiliments in which, upon festive days, I was then arrayed?—the Brussels lace, the bishop's lawn, the lily train which kept my baby legs so delicately snug, so decently concealed, the embroidered cap, the endless folds of flannel. Where are the troops of young-lady friends who were once so eager to dandle, to caress me, to lay their soft fair cheeks to mine as they replaced me in my couch after these endearments? Did I sob?—they kissed me; did I yell?—and I did holla a bit sometimes, I flatter myself—they kissed me; did I crow?—which was my infant method of expressing satisfaction—they kissed me all the same. My career was, in a word, luxurious, but, alas! it was but brief. Another reigneth in my stead, and I am denominated now, with bitter disrespect, the Old Baby. The late lord mayor, sunk to a nameless alderman; the ex-minister of state, with nothing to give, and despised by every patriot; the last year's *Bradshaw's Railway Guide*; the shoes which one has grown out of, and that through the upper leathers; the type of all things that have seen their day, and will never see another—the Old Baby!

Is it, then, a sin to be old? Is it wrong to have hair, to be of a flesh-colour, to cease to stare like a

stuffed fish, to devote the hours of the night to sleep, and not to gormandising? If not—since in these respects alone have I offended—why have I thus been punished? I am no longer the idol of my once doting mother, the pride of my father, the boast of my nurse.

The conversation which is now addressed to me ceases to be distinguished by those endearing epithets with which it was so liberally garnished, and is no longer studiously couched in terms supposed to be especially suitable to the infant ear:

'Darling, warling; did it dribble then? Dribbley ibley, dribbley ibley, dribbley ibley: tum and look out at the window pindow, and see the red soldiers go by on their gee-gees: ook at the gee-gees! Did they frighten it? (pathetically.) Was it then? Naughty soldiers, naughty paughty; they shall be popped (with vivacity), popped, popped. Was he hungry, and would he have his dindin (two courses of milk, over the second of which I used to get uncommonly drowsy); dindin, dindin (singing), wrap him in a rabbit-skin; baby go to byby, byby, byby.'

Thus was I wont to be apostrophised in my earlier days. Gorgeous spectacles, always of a novel character, were perpetually being submitted to my notice; food was administered to me, if I did but open my mouth; sleep stole upon me, to the accompaniment of slow music and soft Lydian (or other) airs, and, in particular, with a delicious sideways motion which I miss now extremely. It is remarkable how, as we grow older, we lose not only the pleasures themselves, the innocent pleasures of our youth, but even the capacity for enjoying them. It is sad to reflect, for instance, that that rocking of the human frame, which to the tune of 'Hushy pushy, Baby Bunting,' was once so soothing to it, produces, when attempted at a later period, a feeling akin to sea-sickness!

The same venerable female visitors who were wont to call so often about luncheon-time, and at whose arrival I was at once equipped in my most splendid attire, call now—but it is to see the Other, the new arrival; a most grasping and pugnacious babe, with no nose at all, so far as I can see, and a face, indeed, altogether, which, if it were mine, I should be downright ashamed to let people look at. And yet to hear them talk!

'Oh, what a bew-w-tiful baby! What a charming baby! Only six weeks old! Is it possible, nurse? What notice it takes! [This is when it shrieks with terror and bad temper.] What an eye it has! [This is very true; its left eye is always at the western angle of the lid, trying, as it seems to me, to discover a passage under its blob of a nose, by which it may join the other one.] What a duck of a mouth! [It's much more like an oyster.] I suppose its nose will get all right in time. [Ha, ha!] It's rather small at present, is it not? [Rather.] What a chin! [They might just as well say: "What a couple of chins!" for there are two of them. One of the foolish women perhaps lays down her parasol, and offers to take up the little wretch, who resists frantically.] Won't it come to its —? Never mind, then, my loveliest one! [Oh, to see its wrinkled, crabbed, screaming, variegated countenance, at the moment when this epithet is conferred upon it!] Frightened at the bonnetty ponnetty, was it not? Now then; now she has taken her bonnet off, now it will come to its Margery Pargery! Lor bless me, nurse, if it does not think that I am its mamma! Now, isn't that strange?' And if the reader could see Miss Margaret Crabapple, he would think it strange too. It may require some wisdom in a child to know its own papa; but not to know one's own mother is, in my humble opinion, little short of idiotic. Yet I remember when I was young myself—that is to say,

younger—Uncle George's playing off a trick upon mamma, the humour of which I was at that time unable to appreciate. My dear mother was for ever vowing—for ever, that is, until within the last two months—that I was the most extraordinary infant that had come into the world from the earliest times unto the present, and that there could never be such another in the revolving ages that were to come, and for ever boasting, in particular, of how she should be able, on account of my distinguished appearance, to pick me out from among a hundred others at a baby-show. Now, this latter assertion Uncle George denied; and in order to prove himself in the right, he hit upon this device. Upon my being taken out for a constitutional upon a certain morning, he caused me to be equipped in an entirely new suit of raiment, secretly procured at his own expense, and then to be brought back again to my mother in some quarter of an hour's time by the nursemaid of Mrs Brown, our neighbour, who had been herself confined almost simultaneously, in the character of her son Undecimus Brown. Poor dear mamma fell into the snare at once. She allowed that I was a fine enough child, a more than averagely respectable baby, but still that there was something wanting, she couldn't say what, which her particular offspring possessed in an uncommon degree. I did not seem, somehow, quite so intelligent, quite so clear complexioned, quite so sweet tempered. No, it was not her fancy; there was a marked difference: there was a certain flabbiness about my flesh, and a lack of that healthy firmness about the calves, which was indeed a peculiar and touching *spécialité* about her own darling son. When Uncle George burst out a laughing, and disclosed the trick, it was Falettaff and Prince Hal in *Henry IV.* again, and *The Devil to Pay* as well. My mother insisted upon it that she had known it all along. What an absurd idea that she, a mother, should not know her own dear darling child! What a cruel and unnatural uncle the man must be who could thus trifle with the tenderest feelings of our nature; and then hysterics and the governor sent for, and a regular scene.

My uncle is a bachelor, and did not understand that women will bear anything better than a practical joke. I never was deceived, mind. Even at that period, when I was of course comparatively without experience, it was not easy to take me in. But what is the use of intellect to one in my present state? It would be far better for me, indeed, if I had a less keen appreciation of the position in which I now crawl. I use that expression advisedly; I cannot stand yet, even when holding on to the chairs by the tips of my small fingers. This is, however, the accomplishment to attain which I am directing all my infant energies. I find that crawling brings me into currents of cold air from under doors and elsewhere, and that a higher elevation would partly obviate this; besides which, I am apt to get trodden upon, and when I utter my indignant protest against such conduct, the iron of that sarcasm, long since rusted with my tears, is driven into my infant spirit by the remark: 'Oh, never mind; it's only the Old Baby!' It will scarcely be credited, perhaps, that the principal staple of my present nutriment consists of gravy, saved—that is to say, left—from the mutton or beef of the family dinner of the preceding day, mingled with crumbs of bread swept off on the same occasion from the table-cloth—leavings, offal, garbage, in fact, that is my daily food!

I have seen with my own eyes the Other going out for her perambulation in her perambulator (once my property) attired in my private embroidered pelisse, and sheltered under my particular umbrella from the rays of the sun. My complexion is now of no sort of consequence. I may get black and tau—I'd rather be that than red and yellow as the Other is—for all they care, and be exhibited to the public in a cotton dress

without the least ornament of fancy. Deprivation of necessary milk-diet, neglect, and robbery, are the three simple charges which I have to make against the members of my family and household. Also, inhumanity in short-coating me before my time, through which I have suffered severely in my extremities from the late east winds. Also, and lastly, cruelty in not providing me with anything to sit upon, or, more correctly, with any place where I can sit with comfort and satisfaction, now that there is no more room for me upon my nurse's knee. That generation after generation should 'push us from our stools,' as each grows old, is, as the poet has told us, an event to be expected; but to be pushed about from one article of furniture to another, disrowned, throneless, a very Lear of the nursery, is, I think, rather hard upon a superannuated infant. At present, my existence may be said to be, like any approaching marriage in high-life, upon the *tapis*, or Kidderminster only, from which nobody, save Uncle George, ever takes the trouble to pick me up. In a word, out of revenge, I suppose, for having exceedingly little of that feature himself to boast of, the Other has put my nose out of joint. I'm the Old Baby.

THE CARMELITES OF JESI.*

A few days after my excursion to Loretto, I had my last glimpse of real Italian scenes and Italian life, in a visit to Jesi, a small city of great antiquity, about twenty miles distant from Ancona. The circumstances that led us thither hinged upon the acquaintance of my uncle's family with an Irish priest, who belonged to a convent of Carmelites in that place. Father O'Grady was a jovial, burly personage, with a round bullet-head, an athletic frame, and a stentorian voice, that always reminded me of the holy clerk of Copmanhurst in *Ivanhoe*. His great delight in his occasional visits to Ancona, where he always lodged in a monastery of the same order, was to be invited to our house to have 'a real English dinner,' as he termed it, which he dolorously contrasted with the fare provided by the cook at the Jesi convent. Once, too, the provincial of the order, a fine, dignified old man of seventy-five, with a silvery fringe of hair and regular impressive features, like one of Perugino's saints, came to dine with us, attended by another monk, a certain Padre Fiorenzo, as well as Father O'Grady—both of them very much subdued in his presence. Our Hibernian friend, however, always protested himself indemnified for this restraint, by his gratification at the approval the entertainment drew from his superior, who, as the spring advanced, was urgent that we should test the hospitality of Jesi in return.

Some English travelling friends, waiting for the steamer to Trieste, were comprised in this invitation, which my uncle, though not without some sighs at the long hours of *conversazione*, and making the amiable with the brotherhood, which lay before him, was coerced into accepting; and a beautiful morning in the latter part of June saw the two families in motion.

After following the high road towards Senigallia along the curve of the bay for some miles, the way to Jesi turns inland in a westward direction. Long rows of mulberry-trees, connected by ample festoons of vines; cornfields nearly ripe for the sickle, interspersed with plantations of young maize, beans, and olives, equally indicated the fertility of the country and its staple productions. Less hilly and romantic than the scenery near Loretto, it still had no lack of beauty; a background of mountains was never wanting, and gifted with that marvellous brightness and diversity of colouring peculiar to this climate, the landscape rarely sank into monotony.

* See Journal, No. 373—The Santa Casa of Loretto.

Jesi is an interesting little town, of some 5000 inhabitants, tracing its origin to an indefinite number of centuries before the foundation of Rome, and famed in the middle ages as the birthplace of Frederick II., the great emperor of Germany, whose constant wars with the Roman pontiffs and encouragement of literature, render his memory very popular amongst Italian writers. A thriving trade in silk has preserved it from the squalid misery discernible in most of the inland towns of the Marche; and it can boast of some palaces in tolerable preservation, a casino, a very pretty theatre, and several churches, that of the Carmelites being amongst the principal.

Father O'Grady, radiant with joy, was awaiting us in the street, to shew the way to the hotel where we were to take up our quarters—for within the cloister itself no woman may set her foot—until two rooms adjoining the church and sacristy were prepared for the day's festivities. They had been up since day-break, the good man said, but 'the last touch was still wanting.'

The last touch being a lengthy process, and the inn barren of resources, a walk was proposed. We were conducted by the father and Padre Fiorenzo, his great friend, through the market, the principal square, and the main street called the Corso, the worthy pair being evidently desirous the citizens of Jesi should all participate in the novelty of the presence of strangers, for the town, lying out of the general route of travellers, is very rarely visited. After this promenade, somewhat fatiguing under a noonday's sun, we went over the casino. The billiard, conversazione, and ball rooms, all well arranged, and in good taste, incomparably superior to any corresponding establishment in towns of far higher pretensions in England; but then, as Lucy was at hand patriotically to remark, had we not mechanics' libraries, and schools, and charitable institutions, to atone for this deficiency? Admitting all this to its fullest extent, I cannot see why casinos, on the same simple footing as those so common in Southern Italy, should not be advantageously grafted on English county society. In towns too small to have a *casino de' nobili* to themselves, the higher and middle classes are content to waive questions of caste, and meet, as at Ancona, or Macerata, or Jesi, on this neutral territory. Once a week, during Lent or Advent, when there is no opera to serve as a rallying-point, reunions for music and cards draw together the subscribers, without any extravagance in dress on the part of the wealthier ladies, provoking the less affluent to foolish emulation. Two or three times in the course of the year, balls are given, where a greater display is permitted, yet still without the inequalities of fortune thus rendered more apparent leading to any offensive airs of superiority. No refreshments are supplied on these occasions, the low amount of the subscription, twelve dollars a year for each member—inclusive of his family, however numerous—not furnishing funds beyond those necessary for attendance, lights, and music, and keeping up the establishment for the old bachelors and heads of houses, who frequent it regularly every day and every evening the whole twelvemonth round.

We concluded our peregrinations by the inspection of the theatre, Padre Fiorenzo having an acquaintance with one of the *employés*, through whom access to it was obtained. Even with the disadvantages of being seen by daylight, it might be pronounced a very elegant little structure; the columns and ceiling ornamented in white and gold, and the three tiers of private boxes draped with blue silk. Father O'Grady trod the stage with a mock-heroic air, and favoured us with two or three *roulades* of so much effect, that we protested he must often be hearing operas, and hinted he perhaps occasionally ventured there in disguise. At this insinuation, he shook

his portly sides with laughter; but Padre Fiorenzo related with complacency that in fact one night the previous Carnival, they and several others of the brotherhood had been present at a concert given in that same theatre on behalf of the poor, which the bishop permitted all the clergy and *religiosi* to attend; dwelling with the simplicity of a child upon the great enjoyment this had afforded them.

From these mundane resorts—a messenger having come to say all was now in readiness—we adjourned to the church of the Carmelites, where a side-door gave admission to the sacristy, and beyond this to a dark, low-ceiled room, lined with massive walnut-wood presses, in which all the vestments and ornaments for the great religious solemnities were deposited. An iron-barred window looked into the inner quadrangle of the monastery; and through a half-opened door we had glimpses of a long table spread for dinner; around which several dark-robed figures were hovering, the silvery head of the provincial himself now and then discernible as he directed the arrangements.

Father O'Grady being troubled in his mind about a certain plum-pudding, on the manipulation of which the dawn of morning had found him engaged, now ceded his post as chief spokesman and squire to Padre Fiorenzo, who, with two other elderly monks, very gladly engaged to do the honours.

The next half-hour saw the good father revolving perpetually between us and the kitchen, now disputing with the cook, an octogenarian artist, who had no sympathy for such outlandish compounds, now restraining the merriment of some of the younger visitors, for whom the idea of transgressing convent etiquette was irresistibly attractive. A door from the sacristy temptingly stood open, leading down by two or three steps into the court, of which the church and the rooms we occupied formed the southern extremity and barrier. Under pain of the severest excommunication, the monks repeatedly assured us, females were interdicted from proceeding further; the threshold on which we crowded on hearing these particulars, being the utmost boundary. The two blooming, joyous sisters, just out of the school-room, who had accompanied us from Ancona, with a mother too indulgent to act as any check on their spirits, and an elder brother, a barrister, almost as full of sport as themselves, proved amusingly refractory on this occasion. Whenever the provincial—who had come in once or twice to pay his compliments—was out of the way, or my uncle's attention was engaged, they made a feint of dancing down the steps and rushing into the forbidden ground; just for the amusement of being chased back again by the terrified Padre Fiorenzo, and rebuked by Father O'Grady, who evidently enjoyed the joke, though he tried to look serious upon it, with: 'Children dhear, why can't ye remain quiet? Shure, now, it's excommunicated ye'll be! Ah! more's the pity that ye don't care for that! Now jist be asy, and don't turn the house out of windows.' But as the 'children' would not be 'asy,' after one or two more *escapades*, the door was locked; and they were fain to resort to some new device to beguile the time. Visible from the iron-barred window were some of the younger brethren walking up and down the prohibited quadrangle, trying to get a glimpse of the English heretics, whose visit had thrown the whole community into such pleasurable excitement. With black silk scarfs and white handkerchiefs, the delighted mad-caps extemporised some nuns' costumes, in which they took their stations at the window, and confronted Father O'Grady as he was crossing the enclosure on his return from one of his expeditions to the kitchen.

The admiration of Mother Hubbard, in that renowned epic of our infancy, on finding her faithful canine attendant travestied in a court-suit, has its parallel in the father's astonishment and laughter at

this apparition, in which he was chorused by Padre Florenzo and the others; until hearing the provincial approaching, they wiped their eyes, and entreated them to remove their impromptu attire; while to keep them out of further mischief, and provide some employment for the more sober members of the party, they asked the superior's permission to shew us the church vestments. This was graciously accorded; and one after another the presses were opened by the monks; and rich brocades, tissues of gold and silver, silks embroidered in various colours, were successively drawn forth, the provincial himself deigning to explain for what they were designed.

The welcome announcement of dinner still found us thus engaged. We were ushered with great glee—for I cannot repeat too often that, with the exception of the provincial, they all seemed as easily set laughing as a parcel of school-boys—into the next room, where our venerable host and the fathers who had previously been making conversations, took their seats with us at the table. We were waited upon by two lay-brothers, whose broad smiles and occasional remarks, shewed they participated in the general hilarity; the provincial himself playing the courteous attentive host to perfection, seeming to sanction and approve it. To say the repast was seasoned with Attic salt would be a flower of speech; neither was there anything peculiarly droll in the sallies with which Padre Alberto, the *bel esprit* of the convent, sustained, or, in Father O'Grady's opinion, enhanced his reputation; but there was something as pleasant in the intense childlike happiness of these good Carmelites, that it would have been invidious to scan their intellectual attainments at such a moment. Dr Primrose's oft-quoted words were exactly applicable to that party: 'I can't say whether we had more wit among us than usual, but certainly we had more laughing.'

Of the dinner itself, I shall say but little; the readers of these sketches must be by this time familiar with Italian hills of fare. The soup of clear broth, wherein floated little squares of a compound resembling hard custard; the unfailing *lesso*; a *frittura* of brains and bread-crumbs, sprinkled with powdered sugar; larded oysters; a dish of fennel-root, dressed with butter and cheese; roast kid; a pie, of which cookscombe were the principal ingredients, with a sweet crust; a *suppa* *Inglesa*, cake steeped in rum and covered with custard; 'on purpose,' the provincial said, 'for the English ladies, accustomed from childhood to mix spirits with their food;' and, lastly, Father O'Grady's plum-pudding, but, alas! served in a soup-tureen, for the flour had been forgotten in its composition, and no amount of boiling had availed to give it the desired consistency. Still the innumerable jokes this furnished, amply compensated for its partial failure; the young barrister told them it was exactly like the plum-broth served out at Christmas at St Cross's Hospital, one of the most famous institutions in England, he asserted, for good cheer, and incited every one by example as well as precept to do justice to Father O'Grady's culinary achievements. Though he had already shewn himself envious of a boa constrictor's capacity, he now sent his plate for a second supply, compelling Padre Florenzo, as a tribute to friendship, to do the same.

At the conclusion of the banquet, Fra Carmelo, the old cook of whom we had heard so much, and who was declared to have acquitted himself right manfully, was summoned to receive the thanks of the company. The messenger found him playing the guitar, with which he was wont daily to solace himself at the completion of his duties in the kitchen, and triumphantly led him forward. In his brown Carmelite dress, he certainly looked a most interesting cook. Though past eighty, his tall spare figure was only slightly bowed; and there was a vivacity in his light-blue

eyes and ruddy complexion, which led to the conclusion that his alleged occasional shortcomings in his art were more the result of inattention than incapacity.

On rising from table, the provincial offered to *fare due passi*, a great distinction, which was of course accepted. Again the whole party sallied forth, he and my uncle—who won golden opinions, though suffering martyrdom throughout the day—leading the van. We went to see two or three churches, and then, at Father O'Grady's suggestion, were taken to a nunnery, which he knew would be a treat for us. All the sisters crowded to the *parlatorio* to see the strangers. It was not a grating, as in the stricter orders, but simply a large aperture like a wide unglazed window, at which they clustered, talking eagerly to the monks, asking questions about the little world of Jesi, and gazing with unrestrained and delighted curiosity upon us.

Amongst fifteen or sixteen thus assembled, little beauty, less mind, was discernible. I saw but one interesting face—a face that had, or might have had, a history written on it. Indeed, several of these nuns were positively ill favoured, evidently devoted to the cloister because their parents had found it impracticable to get them otherwise disposed of. Some told us they had never left the convent since their first entrance as *educande*, seven or eight years of age; they grew attached to the nuns and their companions, and as the time for returning home drew nigh, estranged by many years' separation from their families, besought that they might not be removed, and passed through their novitiate, and took the veil, without ever going beyond the walls. They all talked as fast as possible, so if to make the most of the opportunity; interspersing whatever they said, or commenting on whatever they heard, with invocations to the Madonna and saints, and ejaculations of simple wonder. I was amused, though, at nothing how well informed they were of all that was passing in Jesi society; their information being derived, the monks told us with an air of pitying superiority, through whatever they could glean from occasional visitors; but especially from the gossip collected at market by the woman charged every morning to purchase their supplies, and who, in consigning the provisions at the convent-wicket, communicates any novelties she has picked up. A single observation denoting deep thought or enthusiasm, I sought in vain to hear; indeed, as I reflected at the time, it would be difficult to convey any notion of their limited capacity. Not tending the sick, not instructing the poor; with only four or five *educande* to bring up till the age of sixteen or seventeen, exactly as they themselves have been educated—embroidery and the making of confectionary filling up all the leisure left after the performance of their stated religious exercises, which call them for several hours daily to the choir, what a dreary unsatisfactory life, according to our notions of existence and its duties, stretches itself before these women. But they said they were happy; and, looking at the bery of English girls before them, lifted up their eyes and hands in sadness to think their hearts were not disposed to follow their example.

It was pleasant to know what delight our visit had afforded them, and to note the earnestness with which they begged us to return to Jesi and come to see them; to have the conviction that we had furnished the whole sisterhood with materials for at least a fortnight's conversation, and several years' reminiscence.

The good Carmelites, too, if our self-pride did not greatly mislead us, marked this day with a white stone; and long after the pursuits and interests of a busier life have dimmed its recollections with the majority of their guests, will continue to treasure every incident of their visit.

My leave-taking of the good monks of Jesi was soon followed by a long farewell to Ancona and its kindly people. In bringing these sketches to a conclusion, I

feel as if the pain of parting were renewed, while many unrecorded traits of courtesy, sympathy, and friendship crowd upon me. If such omissions have arisen, it has been from no spirit of depreciation. In reminiscences like the foregoing, the peculiarities a stranger cannot but fail to remark must be prominently brought forward: those good qualities no impartial observer can deny to the national character being often left in the background, simply because offering less scope for comment or description.

The sole merit of what I have written is its truth. Not an anecdote, not an incident, is here given but what is scrupulously authentic. With a little exaggeration, I might have been much more amusing, but I preferred delineating these things as they really are—in their light and darkness, in their fairness and deformity—in what our pride might stoop to imitate, or our gratitude make us thankful that we differ.

A REMINISCENCE OF FIELD LANE.

FIELD LANE is now a thing of the past. That odd-looking bower of dangling silk-banners, beneath which a colony of filthy Jew-fences with villainous faces, and fat Jewesses stunted in skirt and bare of elbow, burrowed and sweltered in darkness and foul vapours, has at length vanished. London has lost something by the loss of Field Lane. It has not a single alum left to compare with the commercial resorts of Constantinople or Grand Cairo, as Field Lane did, rivalling them in its mingled aspect of brilliancy and squalor, its shady sunlessness, even in the dog-days, and its odours so genuinely Asiatic. But nobody need regret that that delectable Goshen has disappeared from the map of London, unless it be the pickpockets, whose bazaar and sanctuary it was, and who made it so picturesque a garner of their *spolia opima* as to compensate in some degree to the public eye for the solace of which they deprived the public nose. A hundred thousand handkerchiefs per annum, it is said, were bought and sold in Field Lane—all extracted from the pockets of the public by rule of thumb, and all hung up as trophies in that sinuous gallery of banners for the said public to admire, and purchase if they chose. And the public did admire, in their way; that is, they laughed at the impudence of the thing—made of the thief's market a standing joke—in some sense, took a sort of pride in it, and commended it to strangers and country-cousins as a lion of a peculiar species: not the real British animal, of course, but yet a smart, plucky beast that scorned to carry his tail between his legs.

I confess, for my part, I never relished the jokes of which this den of rascality was the standing occasion. I had a reason for it. For more than five-and-twenty years I never came within sight of it without a shudder; and never passed, in all that time, its Holborn outlet without involuntarily quickening my pace until it was at least fifty yards in the rear. I am glad at last to see it razed to the ground. You will hardly wonder at that if you read what I am now going to set down.

In the summer of 1832 I was a young blockhead just turned twenty-one: to be sure, what an ass I was, half fool and all fool! I had served my time down in Suffolk (I shan't say where), and had learned my trade as a hair-dresser, by dint of seven years' practice, tolerably well. At the expiration of my apprenticeship, I came up to town with all my fortune—above a hundred pounds—in my pocket, intending to see the world and enjoy myself before I settled down to business. I bought a fashionable suit, sported cream-coloured gloves, hung a gold guard-chain that cost me ten guineas round my neck,

cocked my Paris beaver on one side, and strutted the streets with a tasselled amber-headed cane. Faugh! I almost deserved what I met with.

Well, I did enjoy myself, notwithstanding. Everything was a pleasure to me in those days—and then, as to Vauxhall, the theatres, the dancing-rooms, the free-and-easies, the shades—I thought them Paradise itself. I made friends with some young fellows as silly as myself, and together we flattered ourselves we 'did the thing'—and many a preposterous and senseless thing we certainly did.

One day, having made an appointment to dine with one of these chance acquaintances, I was proceeding in full costume along Holborn towards the place of assignation, when a mop-headed, ragged urchin ran against me, and nearly tripped me up; and the next moment, I discovered that I had lost my handkerchief from my pocket. I was too green to suspect the little vagabond of having taken it—besides, he had disappeared. The loss was nothing; it was only the trouble of purchasing another. I proceeded onwards on the look-out for a shop, when I came suddenly upon the entrance to Field Lane, which disclosed to my view thousands of handkerchiefs dangling from walls, and lines, and open windows: and up I walked to make my selection. The queer aspect of the place tickled my fancy, and amused me much—the chaffing, squabbling, and bawling—the coarse jokes I heard, the odd faces that peeped out on all sides—the myriads of silken spoils that fluttered around and aloft—all struck me with an agreeable sense of novelty, and, being in no hurry, and thinking I might as well see the whole of it, I wandered from end to end of the lane before troubling myself about the business in hand. The sirens of the place, plump and unctuous, paid me marked attention, and would fain have entrapped me into a bargain, but I was callous to their compliments, and held on my way. Having at length satisfied my curiosity, I retraced my steps, and entering a shop at hazard, demanded to be shewn some of the best of the wares. The shop was a sort of shed-looking chamber, which was almost empty; the whole of the merchandise having been transferred to the lines and poles without, where, as it hung thick as leaves on a tree, it completely obscured the view of what was passing in the lane. The man who rose up from behind the counter in answer to my challenge, seemed to my first view all nose and scrubby hair; but a pair of dark-black eyes twinkled beneath one broad bush of brow that covered them both, and his bristly jaw contorted with a grin as he asked: 'Didg' yer vant de verra pest, ma tear?'

Of course I wanted the best, and was not particular as to price.

The fellow eyed me leisurely all over as I gave him to understand that much, and no doubt he took my measure to a hair. 'Den vill de shentleman shtep into de vareus, an' look at some vot is fast-rate?'

He opened a whitewashed door at the end of the shop, and beckoned me to follow. I obeyed; and threading a dark narrow passage some few paces in length, was shewn into a chamber not more than ten feet square, lighted by a small window in the roof, and totally empty, with the exception of what seemed a huge seaman's chest, a short bench, and some tools and billets of wood lying about, together with a dozen or so of big square paving-stones, which seemed to have been brought in from Holborn, which was then undergoing repair.

The Jew produced a bunch of keys from his pocket, and ejaculating: 'Ha, ha, ma tear! I shall shew yer de pootiful gootsh!' began fumbling at the lock of the chest, to open it. But somehow it would not open, and defied all his efforts, till the fellow began to curse the lock, and work himself into a passion with it. He stamped and bawled, and anathematised some

absent old woman, who, he swore bitterly, had been meddling, and had hampered the lock.

At first, the fellow's antics amused me: but all at once it struck me that the passion was unnatural and feigned; and now the queer reports I had heard of London traps and villainies rushed to my recollection: and I began immediately to suspect that all was not as it should be. I turned towards the door, intending to regain the shop, when it suddenly flew open, and a figure in the guise of an old woman, supporting herself on a crutch, barred the way.

I say, in the guise of an old woman; for if that apparition was of the female sex, then I am the man in the moon. I had mown too many masculine beards during the last seven years to be mistaken on that point: the seeming old woman was a sturdy ruffian of forty, not two hours shaved—I saw it at a glance; and the sight sent all the blood in my veins bounding back to its source.

The Jew launched a torrent of abuse at his confederate, and demanded the key of the chest. I was too much prepossessed to note his acts or to hear much he said. I endeavoured to maintain a careless air, but could not withdraw my gaze from the pretended old woman. I heard the box-lid thrown back, and the voice of the Jew extolling the wares within. I made a feint of turning to look at them; and at the same moment I saw the petticoated ruffian feeling with his left hand for what seemed a fragment of a broomstick, which leaned against the wall behind the door. Something—perhaps my better angel—gave me courage. I dashed at the object myself, and seized it firmly in my grasp—it was a painted bar of iron. My worst suspicions were confirmed in an instant; and at the same moment the villains who had me in their toils, threw off the mask. The bigger ruffian lifted his crutch with both hands, and aimed a savage blow, which I luckily caught on the iron bar, and which slivered the crutch to fragments. Almost at the same moment the Jew grappled me by the throat. I dashed the heel of the bar into his face, and he flew to the end of the room, carrying my lavender-silk neck-tie and diamond pin in his hand. I expected the bulkier assassin would close; but, instead of that, he planted his back against the door—now firmly shut—and shielded himself with the remnant of his crutch. No time was to be lost—the Jew would recover himself, and return to the attack in an instant—heavy tools were lying about—I should be beaten down and slain. Madly I rushed towards the door, and was in the act of poising my weapon for a blow which should crush the skull of the burly ruffian, spite of his fence, when suddenly the whole scene shot upwards into the air; the last thing I saw was the fire-flashing eye and demoniac grin of my opponent—and I was falling, falling in a gulf of pitchy darkness.

Men of genius talk and write very fine things about the wondrous celerity of thought, and the freaks of imagination and memory under certain circumstances. I don't understand that kind of subject myself; but it's all true they say, nevertheless. In those most horrible moments I saw myself a child in arms—a boy at school—an apprentice, shaving my master's customers in the old shop—and, what is more, I saw myself dead and dashed to pieces at the bottom of a frightful dungeon, and my mangled body stripped and plundered, and then packed away in a hole, out of the world for ever.

But this terrible vision was not destined to be realised. Instead of dashing on the floor of a dungeon, I fell some into a mass of filthy fluid, the odour of which informed me at once that I had been hurled into the common sewer. The drain was deep, and I had to exercise some skill as a swimmer before I found my feet. Even then I stood up to the armpits

in the vile liquid, the effluvia of which threatened to poison me with every breath I drew. Happily, I had suffered no serious bodily injury by my fall, the force of which had been neutralised by the water. I looked up just as the trap-door through which I had descended was in the act of closing—saw it raised to its level, and heard the villains slipping the bolt that secured it. What was to be done? I gave myself up for lost. If I cried out, none were likely to hear me save the fiends who had compassed my destruction, which any alarm on my part would only goad them to complete. I had not relinquished the iron bar, but still clutched it mechanically, and I now began groping with it in the dense darkness, to ascertain, if possible, in what direction to proceed, to escape, if it might be, from the ruffians' power. I found that I stood in the centre of the channel, in which a slow current ran in one direction, as I judged towards the river. The water shallowed towards the sides. I crept involuntarily to the side furthest from the trap above my head, where the flood scarcely reached to my knees. A deadly shiver came over me, and I felt about with my hands for some place of rest, as I fancied my senses were leaving me. Thank Heaven, that did not take place! A rough sort of buttress of old brickwork projected from the bank, and in the angle of that I crouched half in the water, and tried to collect my wandering faculties. I was hardly ensconced in this position, when a dull gleam shimmered faintly on the surface of the filthy water. I knew it must come from the trap-door overhead, and waited in horror for what it might portend—half-expecting to see the ruffian masquerader descend, knife in hand, to make sure of his work. I held my breath, for I knew that the villains were listening, and that the slightest sound from me would seal my doom. Then I heard a lumbering noise above, and the next moment down came a shower of the monster paving-stones, which would have crashed the life out of an ox had they fallen upon him. Then the trap closed once more, and again all was darkness.

How long I crouched there, devoured with terror and apprehension, I cannot say. To me it appeared an age; it may not have been a dozen minutes. I had come to the conclusion that there I should die, and rot piecemeal, and never be discovered, and there I should have died, it is my opinion, if a new cause of apprehension had not roused me. While I was in the lowest state of despondency, a red gleam shot along the dark water, from the distance of some thirty feet up the stream. I looked, and there, through a hole in the over-arching arch, caused by knocking out a few bricks, appeared the face of the Jew, still bleeding from the complement I had administered, and wild with mingled rage, pain, and anxiety. The wretch held a horse-pistol in one hand, and in the other a lantern furnished with a bull's-eye, which threw its searching rays to whatever point he turned it. I was sure now that my hour was come; but lo! when the flash was turned in my direction, its full force fell on the interrening buttress, and by lying still as I was, I could remain effectually concealed.

Through a small crevice I watched the face of the Jew, as he turned his piercing eyes in every direction, and I thought I read in it at length his conviction that I had perished—a conclusion to which he may have been helped by the sight of my hat cast up in the shallows on one side. In that case, I asked myself, what would he do? Would he not descend with his comrade to find and plunder my body? I had not a doubt of it—and my only chance lay in making my escape before they executed their purpose. The light which had shown me the Jew's face had shown me also something of the bearings of my prison. I saw that I could not proceed down the stream without getting into deeper water, but that upwards the depth

was nothing—the flow rippling over stones and offal that lay in its course. Therefore, as soon as the Jew had disappeared, I rose cautiously from my position, and groped my way through the rayless gloom against the course of the current. I still retained my weapon, and it stood me in good stead as I held it above my head, by warning me when to stoop and save my bare scalp from the impending brickwork. When once fairly out of hearing and sight-range of my persecutors, a fact of which I was aware from the angular course I followed, my spirits began to revive within me, and something like hope once more dawned upon my mind.

To my great relief, I found as I proceeded that the horrible gloom grew less dense, partly, perhaps, because my sight was becoming habituated to it, but partly also because a few rays streamed in here and there through some of the side-gullies of the drain, the ends of which were separated but by a grating from the street, but which were all too narrow to admit the passage of my body. At first, all I cared for was to hasten on and on, away and still further away from the bloodthirsty assassins. Once or twice the main channel, or what appeared to be such, had branched off into other channels as large or nearly so. This gave me some comfort, as in the case of pursuit my pursuers might elect the wrong track, and thus miss me. I had hurried onwards for some hours, and left the murderous den some miles behind before my limbs began to fail me, and I found myself compelled to stop to recruit my strength by rest. I sat down by a side-drain whence a few rays of light shone in, and resting my head upon my knees, allowed the current to flow under my legs. I could hear above my head the noise of the traffic that rolled along the streets, the rattle of wheels, and the pat, pat of innumerable feet—and the tears now for the first time started in my eyes, as I wondered whether I should ever again be restored to the busy world above. This melancholy temper of mind was, however, put to flight by the teeth of a huge rat, which had fastened on my ankle with the gripe of a vice. I had to crush the fellow with my weapon before he would let go, and the next minute had to do battle with hundreds more, which swarmed upon me from all quarters, dashing at my face and hands, and falling on my neck from the roof, which was too low to permit me to stand upright. I must have smashed fifty of them at least before the troop withdrew from me to regale themselves on their dead companions, and allowed me to pursue my way.

This assault deterred me from proceeding further in the same direction, and I resolved to retrace my steps, and try another turning which I had marked about an hour before. One hope had haunted me all along, since I had shaken off the fear of being murdered. I had seen the day before in that neighbourhood a part of the street ripped up for the repair of the main sewer. If I could find that spot, my deliverance would be effected. I could think of no other chance, and naturally clung to that with the tenacity of despair. With an eye to the rats in my progress, I regained the place I sought, and groped along as fast as I could. From the increased noise overhead, and the almost utter absence of light, owing to the length of the side-drains, I gathered that I was traversing one of the grand thoroughfares of the city. Several times I halted, and shouted at the top of my voice at the embouchure of the tributary drains; but no reply ever reached my ears, and I desisted at length in utter hopelessness of making myself heard. I knew by this time, from the hours I had been under ground, that the evening must be drawing in, and I looked for nothing less than passing the night, which, I was convinced, would be the last of my existence, in this living tomb. I knew that as soon as I succumbed to

fatigue, I should be devoured by the swarms of rats; and already I felt exhausted in every faculty of my body.

Conceive my joy, if you can, when, on a chance look backwards in the direction I had come, I perceived at no great distance, and framed in the black circle of surrounding darkness, the figure of a man carrying an old horn-lantern swung from his neck, with a basket at his back, a bag at his girdle, a cage full of live rats in one hand, and a staff in the other. He was attended by a savage-looking bull-terrier, which came scouring towards me open-mouthed, and seemed inclined to resent my trespass on his warren. Never, perhaps, did mortal man rejoice more devoutly than I did at the presence of this strange and unlooked-for apparition. The man, bare to the hips, was a mass of filth and rags: yesterday, I would not have spoken to him on any consideration to be mentioned; but now, I could have pressed him to my heart, or kissed the tattered hem of his garments. I am not sure I did not do something as foolish the moment my trembling limbs had carried me to his side.

The honest fellow did not at all reciprocate my earnestness. Holding me off at arm's-length, he held up his lantern for a good view, and deliberately surveyed me from head to foot.

'Blest if 't ain't a reg'lar swell!' he ejaculated at length. 'Why, what the doose makes the likes of you down in the shore? an' where's yer dog, man alive?—Come into the shore without ne'er a dog! it's a wonder the rats han't a eat ee hup!'

'I didn't come here of my own accord,' I said. 'Shew me the way out, and I'll pay you well.'

'Well, hang me if I knows what to make on it. Not come in o' yer hone accord! How was it then? You've a been here ever since one o'clock, anyhow.'

'No, I have not—it was after three o'clock when I got here.'

'That's onpossible. Tide was a-comin' in then, an' it ain't gone down yet.'

'Will you guide me out, and take a guinea for your trouble?' I said impatiently.

'In course I guides you out, whether I will or no—cos if you follers me, you gits out when I do; but we can't go out till the tide's gone down, an' that won't be for this hour, I reckon. What I wants to know is how you got in—cos it looks queer, yer see. Here, take a swig o' this here, an' tell us all about it.'

He produced a pocket-flask as he spoke, and glad enough I was to take a pull at the fiery spirit it contained, and which almost in a moment gave me new life.

'That's the sort to keep the stench out of a feller's stomick, ain't it?' he said with a grin as he followed my example. 'Now for it. Let's sit down here—my basket's seat enough for two—an' tell us how the doose a gemman like you comes a shorin' of it.'

Without more ado, I told my story as the reader already knows it, to the unqualified amazement and indignation of the hearer.

I shall not repeat his comments on the narrative. 'The bloody-minded villins!' he concluded; 'won't you hang 'em?'

'That I certainly will, if I can lay hold of them,' was my reply.

'An' I'll go an' see 'em swing—blest if I don't.'

'And you,' said I—'how came you here? You seem to be quite at home in this horrible place.'

'Oh,' said he, 'the place is well enough, if that's all—only wish I had it all to myself, an' no hinterlopers. Yer see, I'm a shore-hunter for many a long year. All a feller finds down here is his own, an' nobody thinks of claimin' it agin—wouldn't git it if they did, I reckon.'

'But what can you possibly find here besides the rats—and what use are they?'

'Ah, that's your high'rants! What can I find! Everythink as comes down—leave me alone to find it—spoons, cheynay, money, silver thimbles. I've found a shillin' an' four pence to-day, only three on 'em's bad uns. I've found many a good sovring in my time, an' more bad uns. Then I snares the rats, an' them's eightpence a dozen for killin' wi' the dogs. Then there's the rags an' linen, lots o' that—an' what d'ye think o' plate? Many's the table-spoon I've had, an' tea-spoons too, an' many a silver snuff-box. I know'd a chap as found a gravy-spoon as weighed six ounces, an' a gold lady's watch worth seven pound. Poor crow, he was too greedy, he was—he got shut in here wi' the tide one night without his dog, an' hanged if the rats didn't eat him bup all but his bones. It's the truth I'm a tellin' yer. I helped to git all that was left of him out myself, an' we had to put the bones in a basket: they was all picked clean in a single night. There! I can't abear to think on it. Poor Bill.'

This sort of revelation did not tend to reanimate my courage, and I was glad when the man rose, and whistling to his dog, proposed to go.

'The tide will be low enough to let us out,' he said, 'by the time we gits to the Thames, so we may as well be trackin' it.'

'And which way do you go?' I inquired.

'The way you came,' he said; 'there is no tother way.'

'I can't, I can't attempt it,' I cried—and I really could not; my flesh crept with horror at the idea.

The man lifted his lantern to my face, and marking my evident terror, began to scratch his head and mutter to himself.

'There is another way,' I said: 'they are repairing the sewer somewhere hereabout—surely you can find the place.'

'Them repairs is done, an' closed up last night. But never say die! You said a guinea, didn't yer?' he asked in a decided way.

'Yes, two. Put me above ground, and the money is yours.'

'Come along, then,' he rejoined. 'Step out arter me, an' I'll make it all right.'

He held up his lantern, and struck into a sort of ambling run. I kept close to his heels, and the dog ran yelping before. We soon came to the main drain—descended it some quarter of a mile, then entered an arch to the right, to traverse which we had to stoop to a sitting posture. After a course of more than half an hour at the best speed we could make, my guide stopped at a low outlet not more than twenty inches in diameter, and divesting himself of his various burdens, began to crawl up the orifice, telling me not to follow him, but to wait his return. In less than a minute he bawled out: 'It's all right;' and the moment after, to my indescribable satisfaction, I heard him talking with some one above ground. I waited with what patience I could, but thought the conference would never have an end. At length my deliverer came sliding back again, heels foremost. His reappearance was followed by the sound of blows and the clang of a crowbar on the grating above. My guide now held out his hand for the promised reward.

'Will you not also escape this way?' I asked.

'No,' said he; 'couldn't git my traps through. Besides, the old ooman 'll be lookin' out for me at the river-side, an' she'll be wondrin' where the dooce I'm got to. You're all right now. Just crawl up the drain, an' there you are: there's enough on 'em, I reckon, up there to fish yer out.'

Having recompensed my deliverer beyond his expectations, I followed his directions, more in a dream

than with any real consciousness of what I was doing. I was hauled out, more dead than alive, at the corner of a narrow lane, among a crowd of people assembled to witness my resurrection. I had barely sense enough to make known the address of my landlord, to whose house I was conveyed, I believe, in a cart, upon a bed of straw, after several drivers of cabs and hackney-coaches had declined the honour of my custom.

It was night before I reached home; and from that hour until full two months after, the day and the night were all alike to me, for I was raging in the delirium of fever, and declaiming horrible narratives of murder, and darkness, and skeleton victims, and rats, and gravy-spoons. My poor old mother had to come up from Suffolk to take possession of me. But at last I got well again, in spite of the doctor who dosed me six times a day, and of the aura, who crammed my mother with the notion that, because in my delirium I talked of rats, I was doomed to death.

The first thing I did when I recovered was to hunt up the ruffians who had thought to murder me. I got officers from Bow Street, and invaded Field Lane with the authority of the law. It was all to no purpose. Not only could I not find the villains themselves, but I could not identify even the scene of their atrocity. A perfect stranger to the place, I could only guess at its precise locality—of course could not swear to it. There was no such inner apartment as I described to be found—no trap-door to be discovered in any of the floors; in fact, the whole scene which my terror had indelibly imprinted on my memory, had all vanished together, and the search had to be given up.

The explanation of this seeming mystery must be referred to the time I had lain on a sick-bed, during which the report of my escape may have reached my intending murderers—and it is likely enough that my deliverer may have talked of his adventure, and so put the assassins on their guard. Thus they had time, and to spare, to effect the metamorphosis of their premises, which deceived the officers of justice, and thus facilitated their escape from the gallows they so richly deserved.

Since then, the doubt has often crossed my mind whether the police of Bow Street really believed the strange story I told them. Be that as it may, the reader may rely upon its accuracy so far as my memory serves me at this distance of time—and he will hardly wonder that I do not regret the final erasure of Field Lane from the list of metropolitan lions.

CONSUMMATION OF SMOKE-BURNING.

INDEPENDENTLY of the desired solution of the smoke-consuming problem as regards our private dwellings, a great interest attaches itself to the progress making in the same direction by those who burn coals on a grand scale, as it will be their experience which ultimately will guide the world at large in getting rid of what may be well called a monster nuisance.

But, in a scientific point of view, and as connected with several important branches of economics—as the supply of fuel from the mines, and the greater cheapness of steam-travelling, &c.—this question of perfect combustion and avoidance of smoke must be watched with intense interest by all reflecting and educated minds; and it is with sincere pleasure that we bring before our readers the new facts which are to form the subject of this paper. We shall only premise that space admits of no more than a cursory view of the details connected with the experiments, by which, as it should seem, this grand and important object has been at last achieved with perfect success in all respects. Some time since, a premium

of L.500 was offered by a body, entitled the 'Steam-coal Collieries Association,' for the best method of applying fuel to a *given* multitubular boiler, so as to consume the fuel, and leave no visible smoke to escape into the atmosphere. The question of breadth of fire-grate was left an open one to each competitor; a drawing of the boiler was furnished to each; the coals to be employed on the trial were drawn from the same pit; the results of each stage of the experiments carefully recorded; the residuary portions accurately weighed, and, in short, everything done so as to insure the most perfect *fairness* in the trials.

Judging from the Report now before us, we should conclude that the four plans selected for actual trial were considered the most likely, *a priori*, to meet the required conditions; and, as such, were tried at the expense of the Association. The other candidates, to the number of ninety-nine, refused to avail themselves of the opportunity which was given them of testing their plans at their own expense. We have, therefore, only to do with the four selected ones—namely, those of Messrs Hobson and Hopkinson, Huddersfield; Mr C. W. Williams of Liverpool; Mr B. Stoney, Dublin; and Mr Robson, South Shields. Of these four, the competitor who was declared by the judges to have satisfied the conditions laid down by the Association, was Mr Williams, a gentleman to whom the public are already very deeply indebted for his researches on subjects of this nature; and who is said, in fact, to have taught us all we know of any moment as to the consumption of fuel upon useful and scientific principles in steam-furnaces. We remember the name in connection with an air-jet some twenty-five years ago, which it was said at the time had been found to produce a conversion of the dense smoke of the marine-boiler furnace into a volume of bright flame, and thus to have achieved a great and double advantage. That steamers at the present day continue to announce their approach, while still far in the 'offing,' by the characteristic cloud of smoke, is no proof that Mr Williams was given in that case more credit than he deserved; for, of all slow-coaches in adopting improvements, steam-companies seem to be the very slowest.

Before explaining the different plans brought to trial, and the causes of Mr Williams's success, we shall dwell a moment on some curious and important scientific facts brought under our notice by the Report.

It would seem that the question of *perfect combustion* is not set at rest by the absence of smoke; invisible gases may be passing away unconsumed from want of oxygen—that is, from want of air; and when air is supplied only through the face of the fire-grate, this, on the production of visible smoke, will be the result. Air, then, must be largely admitted; some think it should be *heated* for the purpose, but the judges very properly observe that the heating of air involves so many inconveniences, that it is in no way to be recommended unless absolutely indispensable. It considerably enhances the merit of Mr Williams's system, that it has nothing to do with heated air, or any other troublesome or expensive complications. Its simplicity, indeed, taken in connection with its perfect success, is one of its greatest merits; for it is evident, upon a moment's reflection, that an object may be attained in the laboratory of the chemist by the application of processes and manipulations of a kind which may be quite inadmissible on a grand scale.

It further appears that the mere passing of gases through a body of burning fuel will not of itself destroy the smoke. On this account, it has been proposed to supply a jet of air to the gases just as they are entering the fire from below. The judges remark upon this, that the destructive effect upon the bars supporting this fire has not been sufficiently considered by projectors. The intense heat generated

by the process speedily destroys these bars; and it has been proposed to obviate this difficulty by substituting for them hollow tubes, filled with air or water. From this, it is replied, even if successful to a certain extent, might arise too many inconveniences, in regard of sea-going ships, to render its adoption desirable. The failure of one such tube—and, in spite of all that can be said, we know that, exposed to an intense heat, failure would be extremely probable—might render the whole boiler useless, and stop the voyage.

Again, the judges disapprove of the introduction of *steam* with air into the furnace, which has likewise been proposed; and, without going into the rather deep science of the matter, it must be obvious that this method would be highly objectionable on the ground of expense and complication.

We now come to a brief description of the competing systems, beginning with that of Mr Robson, which was the first brought to trial.

The principle of this plan is to divide the furnace into two fire-grates, the one at the back being shorter than the other, and at a lower level. This back-grate is quite a separate affair, furnished with separate doors for cleaning and the supply of fuel; this door has a valve in it for the admission of air; and there is also what is called a 'distributing tube,' perforated with holes, to allow air to get at all parts of the fire at once.

The plan of proceeding is, to burn *coal* in the front-grate, and coke or cinders in the second. It was expected that the gases generated in the outer, and forced to pass through and over the bright clear fire in the inner, grate, would be all consumed; but in this the judges found that the object was 'only partially accomplished.' The idea, however, is ingenious and interesting; and very probably may contain the germs of success, after some further improvements, likely enough to be suggested in practice. It appears that air is not admitted directly to the fire in the front-grate, and consequently it can excite no surprise that the mass of fuel there burns slowly, with a loss of effective force in the boiler. This is one of the weak points which may be strengthened in time.

The next plan was that of Messrs Hobson & Co. In this, air is freely admitted in various ways, which we shall not pause to describe. There is here a complication of brick pillars and brickwork to distribute and equalise the currents of air, and effect the mixture of it with the gases. 'As to prevention of smoke, this plan was pronounced efficient, though in hard firing it requires considerable attention from the stoker.' The objection is stated to be, that the brickwork is liable to crack, and get out of order, but the judges do not attach much importance to this, as they consider its efficiency to depend, not on the brickwork, but on the equable diffusion of the gases. They further say, that this system is applicable to all forms of boilers; the combustion is very good, and with moderate firing, it does not depend upon the stoker. They are therefore of opinion that it complies with all the prescribed conditions.

We shall now describe Mr Stoney's plan, although not next in order, reserving that of Mr Williams for the last.

This is 'in principle, as far as the admission of air goes, identical with that of Mr Williams;' and this, we may now observe, differs from the first described in allowing the air to enter through the front door. 'Its peculiarity consists in the adoption of a shelf outside the boiler, forming, in fact, a continuation of the dead-plate outwards.' On this shelf the fuel is placed, partly within and partly without the furnace, the door of which is a sliding one, shutting from above, so that the air passes partly through the coals, and partly through perforations made in the door for the

purpose. The coal is pushed forward to supply the furnace as required; but, as it is declared not to have prevented smoke, we shall not dwell longer on its details.

The successful competitor, Mr Williams, admits air in front, at the bridges, and also by small apertures elsewhere, in order to its complete diffusion, in streams and jets, among the gases. In the plan adopted in the present instance, Mr Williams introduces the air only at the front, by means of cast-iron casings furnished on the outside with shutters, so as to vary the area at will, and perforated on the inside with a great number of small holes. 'The mode of firing consists in applying the fresh fuel alternately at each side of the furnace, so as to have one side bright while the other is black.' The results obtained by this method shew a large increase above the standard in every respect. 'The prevention of smoke,' say the judges, 'was, we may say, practically perfect, whether the fuel burned was 15 pounds or 37 pounds the square foot per hour. Indeed, in one experiment the extraordinary quantity of 87½ pounds of coal per square foot per hour was burned in a grate of 15½ square feet, giving a rate of evaporation of 5½ cubic feet of water per hour, per square foot of fire-grate, without producing smoke.' All readers may not exactly understand this; but it will serve to shew, that according to some of the most competent judges in England, Mr Williams has succeeded, not only in producing the standard quantity of steam in relation to the size of the fire-grate employed, but done very much more than this—involving a much greater consumption of coal, and this *without producing smoke*; or, on the other hand, without leaving any portion of the valuable gases contained in the coal unconsumed.

One short quotation more: 'No particular attention is required from the stoker; in fact, in this respect, the system *leaves nothing to desire*, and the actual labour is even less than that of the ordinary mode of firing.' 'Mr Williams's system is applicable to all descriptions of marine-boilers, and its extreme simplicity is a great point in its favour. It fully complies with all the required conditions.'

The substance of this last quotation is, in our view of it, most important. We know quite enough of stokers and firemen to be well aware that, if the effect depended on any extraordinary care on their parts, a few only could be counted upon for such attention. It is a well-known fact that, even in the ordinary furnaces, a *continuous* and moderate supply of fuel will burn almost without smoke; but it was always heaped on in large quantities at a time, and so *distilled*, to the injury of the proprietors, and the annoyance of the neighbourhood.

The general applicability to marine purposes holds out a hope that, 'at long last,' a characteristic feature of a voyage by steam will no longer be the intrusive presence of small balls of lampblack upon the cheek and forehead of beauty, and that, on the approach of a steamer, we may look out for her hull, and not her smoke.

Again, we feel tempted to ask: 'Is there any chance that "Palmerston's act" will now be something more than a "dash in the pan," puffed into our faces by that astute and experienced political engineer?' At present, every proprietor of a volcano claims a legal fifteen minutes for smoking; and what with one difficulty, and what with another, it requires a more experienced eye than ours to distinguish the difference between 'smoky Brummagem,' Manchester, and Leeds, before or since the passing of 'the act.' Now, it will admit of no excuse; and the persecuted and suffering 'natives' will have only themselves to blame if they do not owe their deliverance to this 'excellent device' of Mr Williams.

We trust they will see this clearly—if they do,

it will be the first thing they have ever seen clearly in their own localities—and that they will bestir themselves accordingly.

If, after this notice, they remain indifferent, wrapped up in 'their sulphurous canopy,' we shall quite despair of the case; and say, as the Yorkshirewoman said when depriving the eels of their external cuticle: 'Let 'em alone; *they likes it*.'

It would be unfair to Mr Williams to omit that he has munificently devoted the sum awarded to him as a prize—namely, £500—to the use of an association of a scientific kind connected with the combustion of fuel on scientific and economical principles. This is justly observed upon as highly honourable to his liberality, since he must have been at great expense in the prosecution of those researches, the result of which promises such extensive advantages to the public—indeed, we might have said the world—at large.

[We have now had smoke-prevention in our own premises, with entire and unflinching success, for nine years, by means of Jukes's patent—gradual introduction of coal by means of revolving bars.—Ed.]

OCEOLA:

A ROMANCE.

CHAPTER LI.—WHO WAS THE RIDER?

I FELT faint enough to have reeled from the saddle; but the necessity of concealing the thoughts that were passing within me, kept me firm. There are suspicions that even a bosom-friend may not share; and mine were of this character, if suspicious they could be called. Unhappily, they approached the nature of convictions.

I saw that Gallagher was mystified; not, as I supposed, by the tracks upon the ground, but by my behaviour in regard to them. He had observed my excited manner on taking up the trail, and while following it; he could not have failed to do so; and now, on reaching the glade, he looked upon a pallid face, and lips quivering with emotions to him unintelligible.

'What is it, Geordie, my boy? Do you think the ridskin has been after some dhlrtly game? Playing the spy on your plantation, eh?'

The question aided me in my dilemma. It suggested a reply which I did not believe to be the truth.

'Likely enough,' I answered, without displaying any embarrassment; 'an Indian spy, I have no doubt of it; and evidently in communication with some of the negroes, since this is the track of a pony that belongs to the plantation. Some of them have ridden thus far to meet him; though for what purpose, it is difficult to guess.'

'Massr George,' spoke out my black follower, 'dar's no one ebber ride da White Fox, 'ceptin'—'

'Jake!' I shouted, sharply interrupting him, 'gallop forward to the house, and tell them we are coming. Quick, my man!'

My command was too positive to be obeyed with hesitation; and, without finishing his speech, the black put spurs to his cob, and rode rapidly past us.

It was a manoeuvre of mere precaution. But the moment before, I had no thought of despatching an *avant courier* to announce us. I knew what the simple fellow was about to say: 'No one ebber ride da White Fox, 'ceptin' Missa Vaganny; and I had adopted this ruse to stifle his speech.

I glanced towards my companion, after Jake had passed out of sight. He was a man of open heart and free tongue, with not one particle of the secretive principle in his nature. His fine florid face was seldom marked by a line of suspicion; but I observed that it now wore a puzzled expression, and I felt uneasy. No remark, however, was made by either

of us; and turning into the path which Jake had taken, we rode forward.

The path was a cattle-track—too narrow to admit of our riding abreast; and Gallagher permitting me to act as pilot, drew his horse into the rear. In this way we moved silently onward.

I had no need to direct my horse. It was an old road to him: he knew where he was going. I took no heed of him, but left him to stride forward at his will.

I scarcely looked at the path—once or twice only—and then I saw the tracks of the pony—backward and forward; but I heeded them no more; I knew whence and whither they led.

I was too much occupied with thoughts within, to notice aught without or around me.

Could it have been any other than Virginia? Who else? It was true what Jake had intended to say—that no one except my sister ever rode 'White Fox'—no one upon the plantation being permitted to mount this favourite miniature of a steed.

Yes—there was an exception. I had seen Viola upon him. Perhaps Jake would have added this exception, had I allowed him to finish his speech. Might it have been Viola?

But what could be her purpose in meeting the Seminole chief?—for that the person who rode the pony had held an interview with the latter, there could not be the shadow of a doubt; the tracks told that clearly enough.

What motive could have moved the quadroon to such a meeting? Surely none. Not surely, either; how could I say so? I had been long absent; many strange events had transpired in my absence—many changes. How could I tell but that Viola had grown 'tired' of her sable sweetheart, and looked kindly upon the dashing chieftain? No doubt, there had been many opportunities for her seeing the latter; for, after my departure for the north, several years had elapsed before the expulsion of the Powells from their plantation. And now, that I thought of it, I remembered something—a trifling circumstance that had occurred on that very day when young Powell first appeared among us: Viola had expressed admiration of the handsome youth. I remembered that this had made Black Jake very angry; that my sister, too, had been angry, and scolded Viola—as I thought at the time—for mortifying her faithful lover. Viola was a beauty, and like most beauties, a coquette. My conjecture might be right. It was pleasant to think so—but, alas, poor Jake!

Another slight circumstance tended to confirm this view. I had observed of late a change in my henchman; he was certainly not so cheerful as of yore; he appeared more reflective—serious—dull.

God grant that this might be the explanation!

There was another conjecture that offered me a hope; one that, if true, would have satisfied me still better—for I had a strong feeling of friendship for Black Jake.

The other hypothesis was simply what Gallagher had already suggested—although White Fox was not allowed to be ridden, some of the people might have stolen him for a ride. It was possible, and not without probability. There might be disaffected slaves on our plantation—there were on almost every other—who were in communication with the hostile Indians. The place was more than a mile from the house. Riding would be pleasanter than walking; and taking the pony from its pastures might be easily accomplished, without fear of observation. A great black negro may have been the rider after all. God grant that this might be the true explanation!

The mental prayer had scarcely passed my thoughts, when an object came under my eyes, that swept my theories to the wind, sending a fresh pang through my heart.

A locust-tree grew by the side of the path, with its branches extending partially across. A strip of ribbon had caught on one of the spines, and was waving in the breeze. It was silk, and of fine texture—a bit of the trimming of a lady's dress torn off by the thorn.

To me it was a sad token. My fabric of hopeful fancies fell into ruin at the sight. No negro—not even Viola—could have left such evidence as that; and I shuddered as I spurred past the fluttering relic.

I was in hopes my companion would not observe it; but he did. It was too conspicuous to be passed without notice. As I glanced back over my shoulder, I saw him reach out his arm, snatch the fragment from the branch, and gaze upon it with a puzzled and inquiring look.

Fearing he might ride up and question me, I spurred my horse into a rapid gallop, at the same time calling to him to follow.

Ten minutes after, we entered the lawn and pulled up in front of the house. My mother and sister had come out into the verandah to receive us; and we were greeted with words of welcome.

But I heard, or heeded them not; my gaze was riveted on Virginia—upon her dress. It was a riding-habit: the plumed chapeau was still upon her head!

My beautiful sister—never seemed she more beautiful than at that moment; her cheeks were crimsoned with the wind, her golden tresses hanging over them. But it joyed me not to see her so fair: in my eyes, she appeared a fallen angel.

I glanced at Gallagher as I tottered out of my saddle: I saw that he comprehended all. Nay, more—his countenance wore an expression indicative of great mental suffering, apparently as acute as my own. My friend he was—tried and true; he had observed my anguish—he now guessed the cause; and his look betokened the deep sympathy with which my misfortune inspired him.

CHAPTER LII.

COLD COURTESY.

I received my mother's embrace with filial warmth; my sister's in silence—almost with coldness. My mother noticed this, and wondered. Gallagher also shewed reserve in his greeting of Virginia; and neither did this pass unobserved.

Of the four, my sister was the least embarrassed; she was not embarrassed at all. On the contrary, her lips moved freely, and her eyes sparkled with a cheerful expression, as if really joyed by our arrival.

'You have been on horseback, sister?' I said, in a tone that affected indifference as to the reply.

'Say, rather, pony-back. My little Foxey scarcely deserves the proud title of horse. Yes, I have been out for an airing.'

'Alone?'

'Quite alone—*solus bolus*, as the black people have it.'

'Is it prudent, sister?'

'Why not? I often do it. What have I to fear? The wolves and panthers are hunted out, and White Fox is too swift either for a bear or an alligator.'

'There are creatures to be encountered in the woods more dangerous than wild beasts.'

I watched her countenance as I made the remark, but I saw not the slightest change.

'What creatures, George?' she asked in a drawing tone, imitating that in which I had spoken.

'Redskins—Indians,' I answered abruptly.

'Nonsense, brother; there are no Indians in this neighbourhood—at least,' added she with marked hesitation, 'none that we need fear. Did I not write to tell you so? You are fresh from the hostile ground, where I suppose there is an Indian in every bush; but remember, Geordy, you have travelled a

long way, and unless you have brought the savages with you, you will find none here. So, gentlemen, you may go to sleep to-night without fear of being awakened by the *Yo-ho-ehes*.'

'Is that so certain, Miss Randolph?' inquired Gallagher, now joining in the conversation, and no longer 'broguing' it. 'Your brother and I have reason to believe that some, who have already raised the war-cry, are not so far off from the settlements of the Suwanee.'

'Miss Randolph! Ha, ha, ha! Why, *Mister Gallagher*, where did you learn that respectful appellation? It is so distant, you must have fetched it a long way. It used to be Virginia, and Virgine, and Virginny, and simple 'Gin—for which last I could have spitted you, *Mister Gallagher*, and would, had you not given up calling me so. What's the matter? It is just three months since we—that is, you and I, *Mister Gallagher*—met last; and scarcely two since Geordy and I parted; and now you are both here—one talking as solemnly as Solon, the other as soberly as Socrates! George, I presume, after another spell of absence, will be styling me *Miss Randolph*—I suppose that's the fashion at the fort. Come, fellows,' she added, striking the balustrade with her whip, 'your minds and your mouths, and give me the reason of this wonderful "transmogrification," for by my word, you shall not eat till you do!'

The relation in which Gallagher stood to my sister requires a little explanation. He was not new either to her or my mother. During their sojourn in the north, he had met them both; but the former often. As my almost constant companion, he had ample opportunity of becoming acquainted with Virginia; and he had, in reality, grown well acquainted with her. They met on the most familiar terms—even to using the diminutives of each other's names; and I could understand why my sister regarded '*Miss Randolph*' as a rather distant mode of address; but I understood, also, why he had thus addressed her.

There was a period when I believed my friend in love with Virginia; that was shortly after their introduction to each other. But as time wore on, I ceased to have this belief. Their behaviour was not that of lovers—at least, according to my notion. They were too *friendly* to be in love. They used to romp together, and read comic books, and laugh, and chatter by the hour about trivial things, and call each other jack-names, and the like. In fact, it was a rare thing to hear them either talk or act soberly when in each other's company. All this was so different from my ideas of how two lovers *would* act—so different from the way in which I should have acted—that I gave up the fancy I had held, and afterwards regarded them as two beings whose characters had a certain correspondence, and whose hearts were in unison for friendship, but not for love.

One other circumstance confirmed me in this belief: I observed that my sister, during Gallagher's absence, had little relish for gaiety, which had been rather a characteristic of her girlish days; but the moment the latter would make his appearance, a sudden change would come over her, and she would enter with *abandon* into all the idle bagatelle of the hour.

Love, thought I, does not so exhibit itself. If there was one in whom she felt a heart-interest, it was not he who was present. No—Gallagher was not the man; and the play that passed between them was but the fond familiarity of two persons who esteemed each other, without a spark of love being mixed up in the affection.

The dark suspicion that now rested upon his mind, as upon my own, had evidently saddened him—not from any feeling of jealousy, but out of pure friendly sympathy for me—perhaps, too, for her. His bearing towards her, though within the rules of the most

perfect politeness, *was* changed—much changed; no wonder she took notice of it—no wonder she called for an explanation.

'Quick!' cried she, cutting the vine-leaves with her whip. 'Is it a travesty, or are you in earnest? Unbosom yourselves both, or I keep my vow—you shall have no dinner. I shall myself go to the kitchen, and countermand it.'

Despite the gloomy thoughts passing within, her manner and the odd menace compelled Gallagher to break into laughter—though his laugh was far short of the hearty cachinnation she had been accustomed to hear from him.

I was myself forced to smile; and, seeing the necessity of smothering my emotions, I stammered forth what might pass for an explanation. It was not the time for the true one.

'Verily, sister,' said I, 'we are too tired for mirth, and too hungry as well. Consider how far we have ridden, and under a broiling sun! Neither of us has tasted a morsel since leaving the fort, and our breakfast there was none of the most sumptuous—corn-cakes and weak coffee, with pickled pork. How I long for some of Aunt Sheba's Virginia biscuits and "chicken fixings." Pray, let us have our dinner, and then you shall see a change in us! We shall both be as merry as sand-boys after it.'

Satisfied with this explanation, or affecting to be so—for her response was a promise to let us have our dinner—accompanied by a cheerful laugh—my sister retired to make the necessary change in her costume, while my friend and I were shewn to our separate apartments.

At dinner, and afterwards, I did my utmost to counterfeit ease—to appear happy and cheerful. I noticed that Gallagher was enacting a similar *actier*.

Perhaps this seeming may have deceived my mother, but not Virginia. Ere many hours had passed, I observed signs of suspicion—directed equally against Gallagher as myself. She suspected that all was not right, and began to shew pique—almost spitefulness—in her conversation with us both.

CHAPTER LIII.

MY SISTER'S SPIRIT.

For the remainder of that day and throughout the next, this unsatisfactory state of things continued, during which time the three of us—my friend, my sister, and myself—acted under a polite reserve. It was triangular, for I had not made Gallagher my confidant, but left him entirely to his conjectures. He was a true gentleman; and never even hinted at what he must have well known was engrossing the whole of my thoughts. It was my intention to unbosom myself to him, and seek his friendly advice, but not until a little time had elapsed—not till I had obtained a full *éclaircissement* from Virginia.

I waited for an opportunity to effect this. Not but that many a one offered—many a time might I have found her alone; but on each occasion my resolution forsook me. I actually dreaded to bring her to a confession.

And yet I felt that it was my duty. As her brother—the nearest male relative, it was mine to guard her honour—to preserve the family escutcheon pure and untarnished.

For days was I withheld from this fraternal duty—partly by a natural feeling of delicacy—partly by a fear of the disclosure I might draw forth. I dreaded to know the truth. That a correspondence had passed between my sister and the Indian chief—that it was in all probability still going on—that a clandestine meeting had taken place—more than one mayhap—all this I knew well enough. But to what

length had these proceedings been carried? How far had my poor sister compromised herself? These were the interrogatories to which I dreaded the answer.

I believed she would tell me the truth—that is, if entreated; if commanded, no.

Of the last, I felt satisfied. I knew her proud spirit prouder of late. When roused to hostility, she could be capable of the most obstinate resistance—firm and unyielding. There was much of my mother's nature in her, and little of my father's. Personally, as already stated, she resembled her mother; intellectually, there was also a similitude. She was one of those women—for she now deserved the title—who have never known the restraint of a severe discipline, and who grow up in the belief that they have no superior, no master upon earth. Hence the full development of a feeling of perfect independence, which, among American women, is common enough, but in other lands can only exist among those of the privileged classes. Uncontrolled by parent, guardian, or teacher—for this last had not been allowed to 'rule by the rod'—my sister had grown to the age of womanhood, and she felt herself as masterless as a queen upon her throne.

She was independent in another sense—one which exerts a large influence over the freedom of the spirit—her fortune was her own.

In the States of America the law of entail is not allowed; it is even provided against by statute. Those statesmen-presidents who in long line succeeded the Father of the Republic, were wise legislators. They saw lurking under this wicked law—which at most appears only to affect the family relations—the strong arm of the political tyrant; and therefore took measures to guard against its introduction to the land. Wisely did they act, as time will shew, or indeed has shewn already; for had the congress of Washington's day but sanctioned the law of entail, the great American republic would long since have passed into an oligarchy.

Untrammelled by any such unnatural statute, my father had acted as all men of proper feeling are likely to do; he had followed the dictates of the heart, and divided his property in equal shares between his children. So far as independence of fortune went, my sister was my equal.

Of course, our mother had not been left unprovided for, but the bulk of the patrimonial estate now belonged to Virginia and myself.

My sister, then, was an heiress—quite independent of either mother or brother—bound by no authority to either, except that which exists in the ties of the heart—in filial and sororal affection.

I have been minute with these circumstances, in order to explain the delicate duty I had to perform in calling my sister to an account.

Strange that I reflected not on my own anomalous position. At that hour, it never entered my thoughts. Here was I affianced to the sister of this very man, with the sincere intention of making her my wife.

I could perceive nothing unnatural, nothing disgraceful in the alliance—neither would society. Such, in earlier times, had done honour to Rolfé, who had mated with a maiden of darker skin, less beauty, and far lighter accomplishments than Maimee. In later days, hundreds of others had followed his example, without the loss either of *caste* or character; and why should not I? In truth, the question had never occurred to me, for it never entered my thoughts that my purpose in regard to my Indian *fiancée* was otherwise than perfectly *en règle*.

It would have been different had there been a taint of *African blood* in the veins of my intended. Then, indeed, might I have dreaded the frowns of society—for in America it is not the colour of the skin that condemns, but the blood—the blood. The white

gentleman may marry an Indian wife; she may enter society without protest—if beautiful, become a belle.

All this I knew, while at the same time I was slave to a belief in the monstrous anomaly that where the blood is mingled from the other side—where the woman is white and the man red—the union becomes a *mésalliance*, a disgrace. By the friends of the former, such a union is regarded as a misfortune—a fall; and when the woman chances to be a *lady*—ah! then, indeed—

Little regard as I had for many of my country's prejudices regarding race and colour, I was not free from the influence of this social maxim. To believe my sister in love with an Indian, would be to regard her as lost—fallen! No matter how high in rank among his own people—no matter how brave—how accomplished he might be—no matter it were Oçeola himself!

CHAPTER LIV.

ASKING AN EXPLANATION.

Suspense was preying upon me; I could endure it no longer. I at length resolved upon demanding an explanation from my sister, as soon as I should find her alone.

The opportunity soon offered. I chanced to see her in the lawn, down near the edge of the lake. I saw that she was in a mood unusually cheerful.

'Alas!' thought I, as I approached full of my resolutions—'these smiles! I shall soon change them to tears. Sister!'

She was talking to her pets, and did not hear me, or pretended she did not.

'Sister!' I repeated in a louder voice.

'Well, what is it?' she inquired drily, without looking up.

'Pray, Virginia, leave off your play, and talk to me.'

'Certainly that is an inducement. I have had so little of your tongue of late, that I ought to feel gratified by your proposal. Why don't you bring your friend, and let him try a little in that line too. You have been playing double-dummy long enough to get tired of it, I should think. But go on with the game, if it please you; it don't trouble me, I assure you.'

A Yankee ship and a Yankee crew,

Tally high ho, you know!

Won't strike to the foe while the sky it is blue,

And a tar's aloft or a-ow.

Come now, little Fan! Fan! don't go too near the bank, or you may get a ducking, do you hear?'

'Pray, sister Virginia, give over this badinage: I have something of importance to say to you.'

'Importance! What! are you going to get married? No, that can't be it—your face is too portentous and lugubrious: you look more like one on the road to be hanged—ha, ha, ha!'

'I tell you, sister, I am in earnest.'

'Who said you wasn't? In earnest? I believe you, my boy.'

'Listen to me, Virginia. I have something important—very important to talk about. I have been desirous of breaking the subject to you ever since my return.'

'Well, why did you not?—you have had opportunities enough. Have I been hidden from you?'

'No—but—the fact is'—

'Go on, brother; you have an opportunity now. If it be a petition, as your looks appear to say, present it; I am ready to receive it.'

'Nay, Virginia; it is not that. The subject upon which I wish to speak'—

'What subject, man? Out with it!'

I was weary with so much circumlocution, and a little piqued as well; I resolved to bring it to an end. A word, thought I, will tame down her tone, and render her as serious as myself, I answered:

'Oceola.'

I looked to see her start, to see her cheek turn alternately red and pale; but to my astonishment no such symptoms displayed themselves; not the slightest indication of any extraordinary emotion betrayed itself either in her look or manner.

She replied almost directly, and without hesitation:

'What! the young chief of the Seminoles? our old playfellow, Powell? He is to be the subject of our discourse? You could not have chosen one more interesting to me. I could talk all day long about this brave fellow!'

I was struck dumb by her reply, and scarcely knew in what way to proceed.

'But what of him, brother George?' continued my sister, looking me more soberly in the face. 'I hope no harm has befallen him?'

'None that I know of: the harm has fallen upon those nearer and dearer.'

'I do not understand you, mysterious brother.'

'But you shall. I am about to put a question to you—answer me, and answer me truly, as you value my love and friendship.'

'Your question, sir, without these insinuations. I can speak the truth, I fancy, without being scared by threats.'

'Then speak it, Virginia. Tell me, is Powell—is Oceola—your lover?'

'Ha, ha, ha, ha, ha, ha!'

'Nay, Virginia, this is no laughing matter.'

'By my faith, I think it is—a very capital joke—ha, ha, ha!'

'I want no trifling, Virginia; an answer.'

'You shall get no answer to such an absurd question.'

'It is not absurd. I have good reasons for putting it.'

'Reasons—state them, pray!'

'You cannot deny that something has passed between you? You cannot deny that you have given him a meeting, and in the forest too? Beware how you make answer, for I have the proofs. We encountered the chief on his return. We saw him at a distance. He shunned us—no wonder. We followed his trail—we saw the tracks of the pony—oh! you met: it was all clear enough.'

'Ha, ha, ha! What a pair of keen trackers—you and your friend—astute fellows! You will be invaluable on the war-path. You will be promoted to be chief spies to the army. Ha, ha, ha! And so, this is the grand secret, is it? this accounts for the demure looks, and the old-fashioned airs that have been puzzling me. My honour, eh? that was the care that was cankering you. By Diana! I have reason to be thankful for being blessed with such a chivalric brace of guardians.'

In England, the garden of beauty is kept

By the dragon of prudery, placed within call;

But so oft this unamiable dragon has slept,

That the garden was carelessly watched after all.

And so, if I have not the dragon prudery to guard me, I am to find a brace of dragons in my brother and his friend. Ha, ha, ha!'

'Virginia, you madden me—this is no answer. Did you meet Oceola?'

'I'll answer that directly: after such sharp espionage, denial would not avail me. I *did* meet him.'

'And for what purpose? Did you meet as lovers?'

'That question is impertinent; I won't answer it.'

'Virginia! I implore you—'

'And cannot two people encounter each other in

the woods, without being charged with love-making? Might we not have come together by chance? or might I not have had other business with the Seminole chief? You do not know all my secrets, nor do I intend you shall either.'

'Oh, it was no chance encounter—it was an appointment—a love-meeting: you could have no other affair with him.'

'It is natural for you to think so—very natural, since I hear you practise such *duettos* yourself. How long, may I ask, since you held your last *tête-à-tête* with your own fair charmer—the lovely Maumee? Eh! brother?'

I started as if stung. How could my sister have gained intelligence of this? Was she only guessing? and had chanced upon the truth?

For some moments, I could not make reply, nor did I make any to her last interrogatory. I paid no heed to it, but becoming excited, pressed my former inquiries with vehemence.

'Sister! I must have an explanation; I insist upon it—I demand it!'

'Demand! Ho! that is your tone, is it? That will scarcely serve you. A moment ago, when you put yourself in the imploring attitude, I had well-nigh taken pity on you, and told you all. But, *demand* indeed! I answer no demands; and to shew you that I do not, I shall now go and shut myself in my room. So, my good fellow, you shall see no more of me for this day, nor to-morrow either, unless you come to your senses. Good-bye, Geordy—and as *revolt*, only on condition you behave yourself like a gentleman.'

A Yankee ship and a Yankee crew,

Tally high ho, you know!

Won't strike to the foe, &c. &c.

And with this catch pealing from her lips, she passed across the parterre, entered the verandah, and disappeared within the doorway.

Disappointed, mortified, sad, I stood riveted to the spot, scarcely knowing in what direction to turn myself.

BURIED TO-DAY—

FEBRUARY 23, 1853.

BURIED to-day!

When the soft green buds are bursting out,

And up on the south wind comes the shout
Of the village boys and girls at play,
In the mild spring evening gray.

Taken away,

Sturdy of heart and stout of limb,

From eyes that drew half their light from him,
And put low, low, underneath the clay,
In his spring—upon this spring-day.

Passes to-day

All the pride of young life begun,

All the hope of life yet to run;

Who dares to question when One saith 'Nay!'
Murmur not! Only pray.

Enters to-day

Another body in churchyard sod,

Another soul on the life in God.

His Christ was buried, yet lives away—
Trust Him, and go your way.

CHAMBERS'S JOURNAL OF POPULAR LITERATURE

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 224.

SATURDAY, APRIL 17, 1858.

PRICE 1½d.

THE SPORTING WORLD.

WE who live cleanly, and have eschewed, perhaps never tasted sack, should nevertheless, it is fitting, turn our attention sometimes to the publicans upon whom also the sun is yet permitted to shine, and for whom—rather superfluously—the waters flow; if even with no other purpose than enjoying a pleasant Pharisaic comparison. These publicans are positively very numerous, and form a considerable, and unhappily by no means uninfluential portion of society. Let us with delicate hand, then, lift a corner of the flaring bar-curtain which conceals them, and let in upon them the pure ray serene of our intelligent observation. The Canadian philosopher has observed that 'Life is not all beer and skittles;' but it is quite clear that he did not comprehend in that remark the well-known and popular journal called *Bell's Life*. There is a number of that accredited organ of the sporting world now lying before us, and it is our purpose—having not so much the interests of science (the culture of the fistic art is there so denominated) as the amusement of the public in view—to dissect it.

We find, then, in these annals of a single week, information concerning no less than forty-eight fights, recent or to come; notices of fifty-two pedestrian matches; of fifteen pigeon-shooting engagements; of twelve 'shows' of a canine character; of three rattings; of five matches at quoits; of seven wrestling-matches; of twenty-eight boat-races; of four performances at bowls; of two rabbit coursings; of three swimming-matches; of one effort of bird-fancy; and of five encounters at a game called Nurr and Spell: besides many score descriptions of yachting, of steeple-chasing, of cricket, of chess, and of racing. With these last more legitimate sports, almost all of us, including the ladies, are acquainted. Scarcely a Quaker sister of us Britons but must have heard, for instance, that *Blinkbonny* won the Derby of '57 with plenty in hand; she must surely have some 'wet' Quaker cousin, or cousin no Quaker at all, who is as interested in the spring meetings at Newmarket as her respectable papa is in those at Exeter Hall. Perhaps no well-regulated middle-class family in the metropolis is so fortunate that no single member of it at any period has ever had a bet upon some 'coming event,' even if he may have never dropped into Tattersall's to pick up a thing or two upon a Sunday. We are confessedly a racing nation, from the aristocratic followers of the head of the 'great Conservative party,' down to the no less credulous professional gentry of the ring, who call *Aphrodite*, *Aphrodight*, 'because Mr Davis says so, and he must know.'

We must study *Bell's Life* where it treats of other topics than these familiar ones, to be made aware how numerous and influential—for it has lots of money—the sporting world, the beer-and-skittle population, really is. What enormous concourse of people, it seems, assemble nightly at the *Spotted Horse*, or the *Weasel Asleep*, to see, not a pugilistic encounter (for on an occasion of that sort whole towns are covered with a locust flight of 'the fancy,' and special trains break down with the weight of them), but the mere 'posting' of the third or fourth deposit-money of twenty-five pounds for the great fight for two hundred pounds, between the Lively Butcher and Young Sambo. How much more crowded (we read) the great room at the Lower Welsh Harp is sure to be, on Wednesday next, at the scaling, which is to take place between twelve and one, and whereat neither man must exceed in weight ten stone; where the *venue* or whereabouts of the forthcoming mill will also be disclosed, which may, however, be learnt even now by safe hands at the Bell and Cauliflower, Barbican, or at Jemmy Durdan's, Crown. What really large sums of money seem to be betted upon these events! how flush of the 'needful,' the 'Californian,' the 'stumpy,' our sporting friends appear to be! How great must be the aggregate amount of deposits in the hands of the editor of *Bell's Life* alone, for all these matches, in which the total sums contended for vary from four pounds to five hundred. Possessing, thus, considerable wealth, the sporting world, however, is far from being proud or exclusive, the most distinguished members of it being almost invariably referred to by familiar titles, such as these—Billy Duncan, Young Reed, Doe of Paddington, Nat Langham, and Jem Ward. Of this latter gentleman, we read: 'Jem Ward is again sparkling in his old horizon (King's Arms, Whitechapel Road); he has painted a picture which he has challenged the world for colour, and can be seen at his house.' We do not consider ourselves capable, nor are we desirous, of criticising this passage, only, with the greatest humility, we should so very much like to know what it means.

One great peculiarity of the ring is the anonymous character of almost all its heroes at the commencement of their profession; they seem to be quite content to lose all individuality in a name such as 'the Novice,' or even to do without a name at all. For instance: 'Alec Keene has an old man, fifty-eight years of age, he will back to fight Jesse Hatton for ten pounds, or twenty pounds, a side, at catch-weight.' Our own weight, although we are far from stout, is certainly not what we should understand by 'catch-

weight; so we suppose there must be some non-natural meaning attached to this term; but apart from that, who would like, at fifty-eight years of age, to be Alec Keene's or anybody else's old man? Jesse Hatton himself seems to hold a far from enviable position. There are no less than four challenges besides the above thrown at that athlete in this present number of *Bell*, all of which are couched in contemptuous language. Jammy Walsh, whose money—one hundred pounds—is always ready at the Blue Cow, Spitalfields, will fight him on almost any terms. The *Spider* is astonished at J. H.'s impudence in offering to find a man to fight him at eight stone four pounds, when his (the *Spider's*) weight is well known to be seven stone seven pounds; but he offers to accommodate Jesse Hatton himself with a very great deal of pleasure. Also, a gentleman will be at Mr Short's, Leaping Bar, Old Street, on Monday evening, to back a novice who never fought for a shilling, against Jesse Hatton for twenty-five pounds a side, at his own weight: also, a novice who never won above five pounds, weight about ten stone, will fight Jesse Hatton for another twenty-five pounds; and if articles with a deposit are sent to us (editor of *Bell's Life*), a match will be made. Poor Jesse Hatton! Well for him that 'Jem Cross regrets to state that his novice, Campbell, has left for Australia' (leaving, as it appears, sundry debts incurred during his novitiate, to pay which, a benefit at J. C.'s would be desirable), or he would certainly have had another adversary upon his hands. Any gentleman seems to be at liberty to take to himself a sparring benefit, whenever he chooses. The Caledonian Mouse intends to have one at *The Black Boy and Still* next week, he says, and all of the right sort will of course be there.

How strange it seems that while Mr Benjamin Caunt here is expressing a wish to back his Enthusiastic Potboy against any man in the world at nine stone eight pounds for two hundred sovereigns, Topper Brown, Esq., should be also advertising in the same column his willingness to accommodate any man in the world at nine stone six pounds! Surely this trifling difference of two pounds should not be allowed to keep asunder heroes like these. There is a certain Elastic Potboy—of little less repute—who will afford, next Monday, in donning the gloves with Johnny Walker, 'a treat in himself, independently of all other considerations.' It would be tedious to narrate the many attractions of the boxing-boudoirs here so much extolled, at all of which the *Bibliotheca Pugilistica* is kept for reference; and where *Futians* and the *Fights for the Championship* are to be had at the bar. Tedious, too, to tell where the best sing-songs at the east-end are held nightly, and where are the snuggest snuggeries at the west; where the Lancashire champion step-dancer holds his harmonic meetings; or where the Indian club and Sir Charles Napier feat are imparted upon moderate terms. Let us rather take a glance, once for all, at the ring itself, to which these others are but mere ministers and accessories. What a peculiar phraseology it has, and yet how thoroughly understood of the people! Neither foot-note nor marginal reference is considered necessary to elucidate a statement of the following kind: 'Seventh round—the *Nigger* came up looking five ways for Sunday.'

Now, what was Sunday to the *Nigger*, or the *Nigger* to Sunday, that he should be so superfluous as to look for it in five several directions? One would have thought it would have been about the very last thing with which this gentleman would have concerned himself, and that which he would know least what to do with when he had found! But the phrase is in common use, it seems, to express the confusion and 'all abroadness' consequent upon having

head and eyes punched to excess in the previous rounds. The weakness of the *Nigger* was such, we are told, that he 'could not make a dint in a pound of butter'—also a pugilistic phrase, and not, as might be supposed, the result of an ingenious experiment proposed by his seconds or other interested persons. He 'had his ruby drawn,' and was then caught up and dashed violently upon the ground by his opponent, the *Young Un*, who, however, 'with the greatest generosity, declined to fall upon him.' Honour to the brave! The *Nigger* was so punished (we read on), that had not his bottom been of the very first quality, the sponge would most certainly have been thrown up even at this early period. He had 'to spar for wind!' We have heard of whistling for wind in extreme nautical emergencies, but this picture of a black man so faint with heat that he has to impart a rotatory or fan-like movement to his flats for the sake of air, is really terrible. Perhaps it was for time only in which to recover breath; at all events, he sparred for wind, but 'the *Young Un* got home heavily upon his occiput (there is no place like home), and then knocked him clean out of time by a hit under the left ear.' Does this fearful sentence mean that the younger of the two antagonists destroyed the other's power of discriminating melody, or that he absolutely killed, launched into eternity, as the chroniclers of the executions have it, this poor black person? who, never let us forget, is a man and a brother, when the hat is going round for the beaten man—beaten because he was knocked out of time—and hence perhaps the expression 'knocked into the middle of next week,' or, more poetically, 'wrapped into future times,' and could not recover in the minute allowed between the rounds. The *Young Un*, who was the favourite from the first, must, it is written, have rocked the gold cradle to some purpose, so many of his handkerchiefs having been distributed before the fight began, upon the usual terms—a sovereign if he won, and nothing if he lost.

This, we suppose, must be the somewhat illegitimate offspring of that chivalrous custom of the knights of old, who always got possession, if they could, of their fair ladies' kerchiefs to wear upon their helms; but a pound apiece seems certainly a very long price for them. Besides this graceful distribution of what, we are distressed to say, are elsewhere denominated 'wipes,' there is another curious piece of delicacy in this account of the late fight between Mr Benjamin Caunt and Mr Nathaniel Langham. 'Ben,' we read, 'barring his mug, was a study for a sculptor; his powerful legs being set off to the best advantage by pink silk stockings and well-fitting drawers.' Why, one would think the man was going to dance a ballet, instead of subjecting himself to such excessive ill-treatment as this: 'Nat fiddled him to within due distance,' 'popped his larboard daddie on his jowl,' 'nailed him prettily on the left squinter,' 'got sharply on to his tenor trap,' 'dropped smartly on to his snorer,' 'set his warbler bleeding;' and, in fact, rendered the whole of his features as unrecognisable physically, as they must appear to any exclusive reader of Messrs Addison and Steele. Still, we think, we would rather be even prize-fighters than wrestlers, who are subject to such conditions as these: 'Two back-falls out of three, Lancashire fashion; no hanging allowed, catch as catch can, in pumps and drawers. The spikes not to exceed a quarter of an inch in length.' The generosity of the *Young Un*, before mentioned, in not throwing himself upon his prostrate antagonist, pales, in our opinion, before the humanity of this regulation. Think of 'drawers,' 'spikes of a quarter of an inch long' (only), and 'catch as catch can!'

Of all the societies which we ever heard of, the least interesting, and yet the most extraordinary, must

certainly be a 'Fancy Rabbit Society,' whereof, it appears from *Bell's Life*, there are scores all over England. Mr W., of the Rochester and Chatham F.R.S., is happy to observe, at the last numerous and harmonic meeting of his club, that 'an infusion of new life has entered into the breeders of this society;' and, certainly, these are scarcely too strong terms to apply to its productions—'sooty fawns,' 'blue and whites,' and 'tortoise-shells'—which were placed upon the table for inspection. One female, with her four young ones, was exhibited, 'whose united measurement of ears was no less than 102 inches; the mother's own ear being nearly two feet long!' Even Mrs Candle could scarcely have objected to her husband belonging to a club of this description—it must surely be the very mildest form of rakishness that ever broke out in a domestic man. We cannot but think that a long course of attendance at the meetings of a Fancy Rabbit Society would be the very thing for softening character and removing asperities.

What a strange but significant communication has our friend *Bell* in his very first page, addressed to a Mr De C—: 'Unless Mr De C— pays certain bets lost by him on the Liverpool and Goodwood Cups, without further application, full particulars of the same will be advertised next week.' Again, what delicate evasions of the laws against betting-houses appear in these singular columns under the attractive titles of 'Winning made Certain,' and 'The Golden Secret Gratis.' '*Judicium (sic) vulgaris est fallax*—public opinion is deceptive,' writes the classical H. J., 'especially in selecting winners for any racing event; therefore, apply for advice to the true source alone;' which is, of course, H. J. himself, who has 'several ready hints for the coming Cesarewitch and Cambridgehire.'

A number of these gentlemen also 'execute commissions to any amount,' the position of whom in the sporting world is such that they must needs be always in possession of the very latest intelligence. Crossed cheques or Post-office orders are received indifferently, only, '*N.B.*—No personal interviews can be granted.'

What is Nurr and Spell, at which Tommy Stephenson of Wortley is open to play any man sixty years of age for five pounds a side, providing he will give him ten score in thirty-one rises? Also, is there any man short of a bird-fancier who can translate this? 'J. Arnold, of the Rising Sun, Stoke Newington, will match his goldfinch against any other for five pounds, for the best and most slamming of a goldfinch, also mule one in the month for the same sum.' Mule one in the month! What possible misprint or assemblage of misprints could have produced this? Here is something like a pigeon: 'Thomas Miller's checkered cock will fly R. Wall's black cock, Podgers' sandy cock, or John Dawson's white cock, or will take a quarter of minute's start of Thomas Leech's blue cock, all from North Shields station.' Also: 'Samuel Binns of Bradford is surprised after what has occurred at seeing John Shannik's challenge of Lamberhead Green: if he really means flying, let him send a deposit to *Bell's Life*, and articles to Davy Deacon's at once.'

There are scores upon scores of other sporting matters here referred to, with the very nature of which folks out of the different 'fancies' can know nothing, each evidently exciting considerable interest, and having large sums depending on it. Those who concern themselves with these exploits, seem to be almost as numerous as the fast men, within everybody's observation, who restrict themselves mainly to the turf, and go about whispering solemnly of good things and certainties. Are they then publicans? Are they small trades-people? Are they gentlemen's servants? Or are they the collected

edition of that Idler whom we see at every street-corner with a straw in his mouth?

Here, again, is quite a riddle to anybody unversed in the mysteries of *Bell*: 'James Carey, *alias* Merryman, will run James Jones, *alias* Titler, a hundred yards level, and take two yards of Edwards, *alias* Fake, in a hundred.' How many people are there, and how many run? Here follow a few of the names of the correspondents of the sporting journal. Had we not read already what we have, we should have pronounced them at once to be fictitious; as it is, we know not what to think. Diddleum Dumps, Happy-go-lucky, An Old Lady Cousin, Ipee Dixit, Bolus, Pickaxe, and Campus Martius.

Even the advertisements are not the least like the advertisements of other papers. Who out of the sporting world ever had a fashionable tailor recommended to him in such a manner as this? 'Do you want a well-built pair of Kickseys?' Whoever saw elsewhere such headings to medical advertisements as these: 'Given away for the good of nervous sufferers,' or, 'For the benefit of suffering humanity, gratis?' What a compliment to the taste of our military is presented in this little paragraph: 'In consequence of the interest evinced by gentlemen in the army (many of whom are now quitting this country, unhappily, for India), the great case in fashionable life before Chief Baron Nicholson, at the Coal Hole Tavern, will be repeated every evening for another week.'

The advertisements conclude with the information that 'Mr Thomas Senn can be seen in Arthur Street, Bloomsbury, daily.' Is this gentleman a *lusus nature*, a beast with a bill, an albino, a lawyer, or a physician? Can he be seen gratis? or if we pay for it, is his appearance worth the money?

Among the answers to correspondents, which vary in subject from dynamics to toasting, there are the following:

'W. H., Reading.—Yes, you idiot.'

'Blinky must have been drunk to ask such questions.'

'J. B.—The accent is on the a.'

'W.—Her depth is sixty feet.'

'We do not know what you mean by "Bar the Bottle."' (Think of the editor of *Bell's Life* not knowing an expression of that kind!)

And 'J. R. P. is informed that by a solution of soda, frequently applied, he may get rid of all his warts.'

Finally, where deaths would occur in most journals, the place is occupied in *Bell's Life* by 'scratchings':

'On the 4th instant, at eight p.m., Diggers Daughter, Star of the East, and Cock-a-doodle-do, out of the Triennial.'

Instead of births we find only 'greyhound produce':

'At Newry on the 20th instant, Mr Savage's black bitch Nameless, whelped nine puppies—namely, four dogs and five bitches, all black, to Mr Rageley's black dog, Master Charles, by Bedlamite out of Perseverance.'

While the nearest approach to a marriage seems to us like the breaking off of one: 'On the 1st instant, at eleven a.m., Miss Harkaway, out of all her engagements at Chester.'

Many of our readers will perhaps be surprised to find by the foregoing account how thriving and populous 'the sporting world' still is. They have supposed, and hoped, no doubt, that the particular classes to which we have been referring belonged to another era, and had died out a quarter of a century ago. Nevertheless, there is balm in Gilead for this matter. It is satisfactory to reflect that this portion of the sporting world is now confined to certain limits, represented only by particular organs, and is

not, as was heretofore the case, suffered to intrude itself through countless channels upon respectable society.

MECHANICAL SELF-CONTROL.

THERE is scarcely a spectacle on this round mechanical world more interesting than a huge steam-engine bending its pivot-joints, and plying its iron limbs with a giant's power. The circle of the writer's familiar acquaintance includes a grim Bolton-and-Watt framed Titan of this species, whom it is particularly pleasant to be on visiting terms with. The writer has long been free to lounge into this grim giant's reception-room whenever it pleases him, and has often stood there entranced in gazing at the monster as he heaves his massive spine up and down, and turns a huge twenty-foot wide fly-wheel, weighing, Messrs Bolton and Watt only know how many tons of iron, by the unceasing pressure of his cranky hand. The strength he puts out upon his whirling task, is altogether as prodigious as it seems. The relentless sweep of the rim of that colossal wheel, as it rushes past the eye with a speed of nearly twenty miles an hour, amply tells how fearful a task it would be to have to arrest its progress. The strength of a hundred horses concentrated in the effort, would be of no avail.

The steam-giant under notice is a very contented workman, in his way. When he has been once set going, he does not at all care how long he is kept at his labour; minutes or hours, weeks or years, are all the same to him; he is entirely indifferent about holidays and sleep. All he requires is, that his employers shall feed him well while his limbs are exerted in their service. He never strikes for wages, but he will strike at any time if food is withheld from him when he ought to receive it, and then not another turn can be extracted from his mighty and otherwise willing arm. He is by no means either an epicure or a gourmand, but it has been found to be good policy to have him treated with great consideration in the matter of diet. A trustworthy and experienced attendant is kept to watch the indications of his appetite, and to serve his meals at proper times. If the curious observer goes round into his dining-room, he will see this attendant shovelling food into the giant's yawning mouth, for he does not care to take his own hand from his labour even whilst at his meals. It will be noticed, too, that his food consists of black glistening lumps, and the giant will be heard to roar with satisfaction as each mouthful is pitched into his capacious gullet, and gulped down. All the energies of the Titanic labourer come, in fact, out of that black, glistening food. Having swallowed it, he digests it in his furnace-stomach, and there assimilates it into served power. Since he thus knocks off such a quantity of work, it will be readily conceived that he is somewhat of a hearty feeder. He eats at least three tons of solid food every day!

There is one peculiarity about this Titanic labourer of the iron thews which is worthy of remark. A giant by nature, of noble extraction, he nevertheless condescends to busy himself with operations that seem to be more appropriate occupations for spiders and caterpillars than for his mighty energies. He expends his gigantic force upon a myriad of pigmy movements, which are individually of the most trifling character. His lot has been cast in the yarn-factory of the Messrs Blake of Norwich. It is those gentlemen who feed him, and it is for their advantage that he labours. Those who would see what it is that he is doing for his board, must pass round to the further side of the party-wall of the giant's reception-room; and there they will observe that the axle of the great fly-wheel passes through the wall, and moves a vertical shaft by the agency of a sort of cogged pinion, which, in its turn, sets a series of horizontal shafts revolving in a

number of long rooms packed one over the other. These shafts whirl round other rods and rollers innumerable. The final result is, that the movement of the great wheel is diffused into that of 10,000 spindles, which wind upon themselves fine flimsy threads of woollen yarn after they have been duly drawn out, and slightly twisted. The machinery accomplishes a few other subordinate tasks; but the great item in the account of work done is still the rotatory evolutions of the almost countless spindles. Placed in the form of an equation, the statement would be: 100 horses = 10,000 caterpillars. The power of the 100 horses draws out and winds 10,000 caterpillar-like threads of flimsy wool.

The scattering of great effort into diffused gentle movement, is a notable affair. In mechanical concerns, there is no such thing as the creation of force; all motory effects are merely mutations of exertion. The stream of power may be dammed up until it breaks forth as a cataract, or it may be spread out into a wide, smooth, lake-like reservoir; or it may be twisted and turned into new channels; but it cannot be absolutely originated out of nothing. The 100 horse-power of the steam-engine was primarily accumulated in the black coal, being communicated to it from the atmosphere when the wood, out of which the coal was made, was growing. That 100 horse-power suffices to drive 10,000 spindles, and would, perchance, turn some few hundreds more, but if successive additions were made, there would surely at last come a time when yet another pigmy spindle would be all that was required to arrest the heavings of the mighty giant—when a minute spindle would indeed be the final straw that broke the camel's back. An instructive illustration of this principle of transmutation of power could be seen until recently at the Messrs Blake's yarn-factory. It occasionally chanced that all the spindles contained in one of the apartments of the factory needed to be stopped at once, without arresting the movement of the rest of the machinery. Whenever this was done, the force which had been previously devoted to the driving of those spindles was immediately left in the arm of the giant as redundant strength. In an instant, this redundant power was transferred to the machinery, which still remained at work, and its spindles began to rattle round with a mad speed that threatened dire mischief to the work on hand. It has happened on more than one occasion, that the sudden putting out of gear of the frames in one room of the factory, has occasioned so much alarm to the work-people stationed in the other rooms, as to cause them to rush in frantic terror from their stations, possessed with the idea that the mill was about to be torn down about their ears.

Every casual inequality in the rate of a powerful steam-engine, whose proper work is of this diffusive kind, is attended not only with inconvenience, but also with absolute loss to the proprietors of the concern, from breakage of yarn, and from other analogous results. It hence becomes an affair of the utmost moment that some means should be contrived whereby an even and steadily regulated movement of the engine may be insured. The ordinary rotating governor, composed of the pair of balls on the divergent rods, does act as a bridle upon the machine, but unfortunately this bridle only comes into action when the increased speed has been entered upon; it is the increased speed that causes the centrifugal divergence of the balls. The engine must be tearing on too fast, before the rise of the more rapidly rotating balls can close the throttle-valve which admits the steam to the cylinder. What is especially required is a hand constantly applied to the lever-handle of the throttle-valve, which shall be so ready, and of such exquisite sensibility, that it can almost anticipate the fitful irregularities of the machinery. This requirement

Messrs Child and Wilson have recently actually furnished. They have contrived a sensitive hand of brass and iron, and have patented the contrivance, under the name of the 'Differential-action Governor.' The steam-engine in the Messrs Blake's yarn-factory at Norwich, now works under the tutelage of this controlling hand; and the grim Bolton-and-Watt framed Titan may be there seen comporting itself with a singularly reformed and equable demeanour, under provocation which before would have driven him altogether wild.

The differential-action governor consists of a cogged pinion, with two toothed racks, one at each side, the teeth being pressed against the cogs of the pinion. One rack, which we will call A, comes down from the centrifugal governor balls of the steam-engine, and turns the pinion on a central pivot as it turns up or down; it also so affects a valve beneath, as to let water into a pressure-cylinder beneath, turning it either above or below a piston-plate which traverses there; the water comes from a high cistern, and acts upon the piston by hydrostatic pressure, driving it up or down. The piston-plate ends above in the second rack, which we will call B. The rack B also turns the cogged pinion as it rises or falls. The pinion itself is on the lever-handle of the throttle-valve, and opens or closes the valve, letting steam into or shutting it off from the steam cylinder of the engine when it is lifted or depressed. When the rack A runs down without B being moved, the pinion is rolled on the rack B, and the throttle-valve narrowed. When the rack B runs up without A being moved, B is rolled on the rack A, and the throttle-valve diminished. When A goes up, and B down, *pari passu*, or the reverse, the pinion is rotated on the pivot, and the throttle-valve is neither opened nor closed. The downward pressure of the governor acts on rack A, and the upward pressure of the water on rack B, and this constitutes the 'differential action.' By this very clever contrivance, the steam is cut off at once, when the speed of the engine's movement is augmented in even the slightest degree: the instant sufficient steam is cut off from or admitted into the cylinder, the centrifugal force of the gyrating governor, and the pressure of the water, neutralise each other, and twirl the pinion round on its pivot, without producing any change of position in the throttle-valve, or alteration of capacity in its aperture. The two racks act upon the throttle-valve together, or separately, or even simultaneously in opposite directions, and so the movements of the throttle-valve are practically determined by the 'difference' between the hydraulic pressure and the centrifugal force; that is, by 'differential action' in the phraseology of the patentees. This is how Messrs Child and Wilson have contrived to endow stubborn and strong-willed steam-machinery with the power of self-control.

To illustrate the capabilities of this ingenious little piece of apparatus, the frames of one of the large rooms of the factory were thrown out of gear, while the writer stood, watch in hand, in the engine-room to note the effects. When the extra twenty horse-power was in this way thrown back upon the engine, the hydraulic rack was seen to lift itself through about the third of an inch, as its opposite neighbour was convulsed by a slight tremor, but this was the only discernible effect. The huge fly-wheel, in perfect unconcern, travelled on in its twenty-five revolution per minute pace. The twenty horse-power revulsion was no more to it than a breath of wind. It was all expended in causing the hydraulic pressure to narrow the opening of the throttle-valve. The work-people in the rooms containing the still effective machinery, were entirely unconscious of any change having taken place in the operation of the mill, with the exception of a single individual, who conceived himself to have

a keener perception than his fellows. He declared that he was conscious of the extra strain having been thrown upon the engine; but, unfortunately for his reputation, it proved that when he fancied the frames were thrown out of gear, they were really in the act of being connected with the engine again.

The working of the factory under the superintendence of this beautiful piece of mechanism, is indeed absolutely regular; the revolutions of the fly-wheel are registered upon a dial-plate by the agency of hands, which serve the further purpose of indicating the precise time of the day. The steam-giant now drives the hands of a clock as well as the 10,000 spindles—he is now a *chronometer* as well as a spinner of wool.

SIBERIA AND CHINESE TATARY.*

THE usual idea attaching to Siberia is that of a place of frightful exile in one of the most inhospitable parts of the globe. Now, there is no doubt of the winter being intensely severe, and of the great length of time requisite for communication with Europe; but, in summer, a great deal of it is a land flowing with milk and honey, full of vast mineral and vegetable wealth, and abounding in the most romantic and beautiful scenery. In the penal settlements there is a severe discipline for the convicts, but the mass of the population of Siberia is the most comfortable and best provided for in the Russian Empire, and this region now contains several towns that have the comforts and luxuries of European civilisation.

But the region to the south-east of Siberia, and on the north-western frontiers of China, was, until the travels of Mr Atkinson, a *terra incognita* to the European geographer, and even the volume already published by him comprises only a portion of his vast seven years' exploration of regions concerning which our geographical data are surmise and hearsay of inaccurate Tatars and Chinese. We learn from this interesting traveller, that it was only by being well armed that he overcame opposition, that he daily practised the rifle, and, on one occasion, had to hold his muzzle for ten minutes to a chief's breast before he could proceed. An examination of the sketches in his portfolios procured us one of the pleasantest days we have passed for a long time, and we feel persuaded that what is to follow will prove fully as important and curious as what has already appeared.

In the meantime, the volume actually published takes us from the Ural to Lake Baikal on the east; and on the south, through the Kirghisian Steppe and the Gobi or Great Desert to the Chinese town of Chin Si, at the foot of the Syan Shan Mountains, which never had been seen by any European. Looking anxiously forward to the account of the further prosecution of his journey, we will, in the meantime, give some account of the ground already traversed.

Mr Atkinson says in his preface: 'I have several times looked upon what appeared inevitable death, and have had a fair allowance of hairbreadth escapes, when riding and sketching on the brinks of precipices with a perpendicular depth of 1500 feet below me. With these accompaniments, I traversed much of the hitherto unexplored regions of Central Asia, and produced 560 sketches of the scenery, executed with the moist colours made by Winsor and Newton—invaluable to an artist employed under such circumstances. I have used them on the sandy plains of Central Asia, in a temperature of 50 degrees Réaumur (144 degrees Fahrenheit), and in Siberia have had them frozen as solid as a mass of iron, when the temperature was 43 degrees Réaumur of frost, 11 degrees below the

* Atkinson's *Oriental and Western Siberia*. Hurst & Blackett. 1856.

point where the mercury became solid, and when I could make it into balls in my bullet-moulds. Some of my largest works have been painted with colours that have stood these severe tests; and for depth and purity of tone, have not been surpassed by those I have had fresh from the manufactory. With cake-colours, all my efforts would have been useless.'

Before we begin with a condensation and analysis of selected portions of the work of Mr Atkinson, it may not be amiss to call attention to the more prominent features of the physical geography of the Russian empire. West of the Ural, we find Russia in Europe to consist of the vast region lying between the Black, the Baltic, and the Caspian Seas, the greater part of it being level, and intersected by noble rivers, adjoining corn-producing alluvial regions, and populated, except in the Baltic provinces, chiefly by native Muscovites; but all to the eastward of the Volga—that is to say, in the ancient khanates of Orenburg and Siberia—the substratum of the population is Turkish, or, according to the new ethnological term, Ugrian. The mountain-chain of the Ural separates Russia from Siberia, and the whole of the territory to the east differs essentially from Russia Proper. The rivers Ob, Yenisei, and Lena drain the backbone of Asia, and are lost in the Frozen Ocean. The plains on the north, in the vicinity of the sea, are inhospitable, and unfit for habitation; but all the mountain-regions are full of the most valuable minerals. The Ural abounds in iron and precious stones, and the Altai in gold and silver.

Ekaterinburg, or the City of Catherine, is the capital of the Ural; and here are the vast mechanical works and manufactories established by government for utilising the minerals of the district. They are built upon an enormous scale, and fitted up with machinery from the best makers in England, under the superintendence of an English mechanic. Precious stones are submitted to the art of the lapidary in another department. The jaspers are found in a great variety of colours—the most beautiful deep green, dark purple, dark violet, gray and cream colour; also a ribbon-jasper, with stripes of reddish brown and green. The porphyries are also of most brilliant colours. Orlite of a deep pink colour, with veins of yellow and black, is semi-transparent when made into vases. Here, also, the beautiful malachite vases and tablets are cut and polished. Those who remember the Great Exhibition of 1851, can have an idea of the beauty of this material and manufacture. Magnificent jasper-tables are inlaid with different-coloured stones, in imitation of birds, flowers, and foliage. Several men are employed in these for six successive years; but the wages are exceedingly low: a man engaged in carving foliage on some of the jasper vases, in a style not excelled in Europe, did not receive more than 8s. 8d. per month, with thirty-six pounds of rye-flour per month, to make into bread. Meat he was never supposed to eat. A married man with a family receives two poods of black flour for his wife, and one for each child, on which they look well. Mr Atkinson saw another man cutting a head of Ajax, after the antique, in jasper of two colours—the ground dark green, and the head yellowish cream-colour, in very high relief, and intended for a brooch. The traveller being an admirable artist, was a judge of such works. He pronounces it to have been a splendid production of art, such as would have raised the man to a high position in any country in Europe except Russia; and yet his pay was 8s. 8d. per month, with bread.

The great wealth of the Demidoff family comes chiefly from the Ural; their estate there is as large as Yorkshire, and full of iron of good quality. Of course, the population is scanty, and this accounts for the wealth of the Demidoffs not being fabulous. Foreigners talk much of the contrasts of wealth and

poverty in England; but the 8s. 8d. per month to the admirable artist-lapidary, and the Demidoff estate as large as Yorkshire, is a contrast still more striking than any we have in England.

English mechanics have been employed in the Ural from a very early period. Many years ago, a mechanic named Major was sent to Ekaterinburg, and when the Emperor Alexander I. visited the mountain, he was greatly pleased with the works Major had established; and, as a token of his satisfaction, presented him with a piece of land containing about twenty acres, with all the minerals it contained, for gold was known to be deposited there. He then began to excavate it, and wash the gold-sand, which proved lucrative, and the amount was weighed and entered in a book, and delivered to Major every evening, who deposited it in an iron box, which stood in his cabinet, the key of which he carried in his pocket. One Sunday evening, Major and his old housekeeper were alone in the house; he occupied in his cabinet, and she sitting in her own room, not far from the entrance-door. Suddenly her attention was drawn to a noise in the outward lobby, which induced her to leave the room. The moment she got into the entrance, she was seized, and thrown down a staircase leading to some apartments below. Her screams and the noise reached Major in his cabinet, who rushed out with a candle in his hand; a blow from an axe fell upon his head, and he never breathed again. After this the murderers possessed themselves of the box and gold, ransacked the place in search of other treasure, and then departed, closing the doors after them. All this time the old woman was lying at the foot of the stairs in a state of insensibility, quite unconscious of the tragedy which had been enacted in the rooms above. It was not until the morning of the third day after, that one of the officers from the machine-works went to consult Major on some matter of importance, when the murder was discovered.

A strict investigation was commenced. The housekeeper, who was long unconscious, began to revive, but nothing clear could be got out of her, and the police were baffled. She had been seized so suddenly that she could not tell how many men were in the lobby. A merchant was suspected from his dealings in gold, but he proved that he was distant ninety versts from the spot at six o'clock on the morning of the murder. Years passed on without a discovery; but the quantity of gold stolen from the mines, and sent into Tatar and Bokhara, had become so enormous, that the Russian government determined to discover how it was effected. So a spy was sent to Ekaterinburg, disguised as a peasant. Even the police authorities on the spot were not aware of his mission. He ingratiated himself at the public-houses with the characters likely to throw light on the subject, and discovered that there were persons in these gold-robberies far away from Ekaterinburg through whom the precious metal was got out of the country into Tatar. He then proceeded to Omsk, and began to offer gold to the Tatars, but with great caution; and he was soon introduced to the great gold-dealer, whose influence was so great that the Tatars dared not buy gold unless it had passed through his hands. His interview took place in the back-room of a large house, where a man with a long Bokhara dress tied round his waist with a shawl, took his seat at the table, and asked the assumed peasant in a very rude manner how much gold he had stolen, where he came from, and other questions calculated to frighten him. All these were answered in a very submissive tone. The gold was then ordered to be produced, which was done, and the weight of each packet marked thereon. The Tatar was asked to pour out all the gold into a scale, but to this the peasant objected, as it was found to weigh less than the seller knew it to be, but

the receiver said: 'What, thief! thou art not content with robbing thy employers, but thou wishest to cheat me. I shall soon hear of thee in the mines of Siberia.' He then offered an insignificant amount for the gold, saying that he gave him five minutes to consider whether he would take the money or be handed over to the police. The arrest of the gang then took place by the agents of the police who had been called upon by the spy, who, having accomplished his mission in Omsk, started for Ekaterinburg, and procured the arrest of the merchant who had been previously taken up, but acquitted of the murder; his wife now revealed where the gold was buried, and on searching for it, they found the axe with which the murder had been committed. This man had long been engaged in gold-smuggling; he associated with those who stole it from the mines. For this purpose, he required good horses, and possessed one of extraordinary power and speed. As soon as the gold had been secured after Major's murder, he mounted his horse, and in about four hours, rode ninety versts, presenting himself to the director at Kamenakoi. The murder was now proved against all who had been engaged in it; they were sentenced 'to run the gantlet' (that is, to walk between the lines formed by a regiment of soldiers consisting of 8000 men, each man striking the victim with a rod), and died immediately after the punishment. The bands of gold-stealers were broken up; some were sent to the mines in Siberia, and the gendarme returned to St Petersburg to receive a reward for his really dangerous labour.

The Altai is the mountain-range in the south of Siberia, in which the Yenisei, and other large rivers of Siberia, flowing into the White Sea, have their source. Parts of it are covered with dense forests of cedars, with a thick underwood which renders progress slow; other parts are clear of bushes, the ground being covered with grass and plants, and above, gigantic cedars, their gnarled and twisted branches forming a canopy through which the sun scarcely penetrates. This is on the northern slope of the Altai; but the southern slope has very little forest. Here are seen in summer the skeletons of Kalmuck winter-dwellings—the birch-bark is stripped off these conical houses, and only the bare poles remain. At this time of the year, the inhabitants are up in the mountains, where they find plenty of grass for their cattle, and where they are free from the mosquitoes. In autumn, they return to the lower grounds, cover their yurts with new bark, and, in a few days, their winter dwellings are completed. On the river Arakym, Atkinson saw many black squirrels, skipping about in the branches; they enlivened the scene, sitting among the foliage. Their fur is a dark gray in winter, at which season Kalmucks kill them, for the fur is not good in summer. Stags are numerous in these mountains, and the Arakym Valley is a great battle-field of bucks in the rutting season. In summer, they are all in the higher regions near the snow, where the mosquitoes and flies cannot follow them. Even the bears, with their rough shaggy coats, cannot remain in the valleys in summer, where these insects are extremely numerous.

Bear-hunting exploits are common in these mountains. One afternoon, a Cossack officer was quietly strolling through the forest alone and unarmed, when he observed a she-bear and her two cubs playing together. When she became aware of his presence, she growled, drove her young ones into a tree for shelter, and mounted guard at the foot of it to defend them. The Cossack then made a temporary retreat, and selected a birch club, four feet long, the quality of which he tested by blows on a tree. When the old bear saw him, she began to growl and pace about uneasily; but the man advanced over a fine grassy turf, with no shrubs or bushes to entangle

his feet. The bear then made a rush at him, and rising on her hind-legs, intended to give him a settler with her powerful paws, or hug him to death; but he made a sweep with his club, and dealt such a blow that she toppled over. Many rounds were fought, her antagonist keeping clear of her paws. She endeavoured to get behind him, but a blow of the cudgel drove her back, until at last she began a retreat towards the forest; but the moment the Cossack moved to the tree, the bear would rush out, taking care not to come within his reach, the cubs remaining in the branches as spectators. At this time, a woodman, returning to the gold-mine, rode into the glade; his first impulse was to run, but the Cossack ordered him to dismount, take off his saddle-bags, and secure the cubs in them. They then started for the village, followed by the bear, that charged repeatedly, and was as often beaten back by the Cossack with his club, who covered the retreat; each time the bear was laid prostrate, and finally would not approach within striking distance: she returned to the forest, and was never seen again. This was a feat of extraordinary daring, skill, strength, and activity; but, after all, our sympathies are with the poor inoffensive bear.

The bear, however, it must be admitted, is not always the injured party. When at the Lake Baikal, Atkinson mentions that three villagers went to hunt in a forest. His informant lost sight of his two companions, lighted a fire, took his evening meal, and was soon fast asleep. Two or three hours had passed when he was awakened by something near him, and, turning his head, he observed by the light of his fire a large bear going down the bank to the little stream. He divined the object of the brute in an instant. Brain was going for water to put the fire out, that he might then devour his victim; for it is an ascertained fact that a bear will not attack a man when sleeping by a fire, but will first go into the water and saturate his fur, to put out the fire. It was but the work of a moment for the hunter to seize his rifle, and stop the proceedings of the animal with a bullet as it was ascending the bank.

The adventures in Mongolia, particularly in the Gobi, lying between the Siberian Altai and the Chinese mountain of Syan Shan, are highly interesting, and we are introduced to the nomade Kirghisian sultans, who appear to be the purest orientals of the Turkish race, having no tincture of European civilisation, like those of Persia, Siberia, or Turkey proper. Every Kirghisian has his battle-axe hanging from his saddle, as in the days of Genghis Khan; and these so-called sultans live like the patriarchs of the Old Testament, estimating their power by their sheep, their goats, and cattle. There was a commotion as Mr Atkinson approached the *aoul* of Sultan Baspasihan; and the escort guided him to a large cattle enclosure, with a tall spear stuck into the ground at the door, and a long tuft of black horsehair hanging beneath its glittering head. This is an old Turkish custom, whence the dignity of a pacha of one, two, or three tails, who, since the modern reforms in the Ottoman Empire, are called *siva*, *ferik*, and *mushir*, corresponding with the ranks of major-general, lieutenant-general, and full general.

Sultan Baspasihan, who welcomed Mr Atkinson, was a strong ruddy-faced man, dressed in a black velvet tunic edged with sable, and wore a deep crimson shawl round his waist. On his head was a red cloth conical cap trimmed with fox-skin, with an owl's feather hanging from the top, shewing his descent from Genghis Khan. A Bokhara carpet was spread, and two boys entered, bringing in tea and fruit. These were his two sons. Silk curtains hanging on one side covered the sleeping-place, and near this a bearcoote, or large black eagle, and falcon were

chained to their perches, every person keeping at a respectful distance from the feathered monarch. On the opposite side, kids and lambs were secured in a pen; and outside the door was a group of women, with their small black eyes fixed on the stranger. Mr Atkinson says: 'My belt and pistols formed a great attraction. The sultan wished to examine them. Having first removed the caps, I handed one to him, he turned it round in every direction, and looked down the barrels. This did not satisfy him; he wished to see them fired, and wanted to place a kid for the target, probably thinking that so short a weapon would produce no effect. Declining his kid, I tore a leaf out of my sketch-book, made a mark in the centre, and gave it to the Cossacks. He understood my intention; split the end of a stick, slipped in the edge of the paper, went out and stuck the stick in the ground some distance from the yurt. The sultan arose, and all left the dwelling. I followed him out, and went to the target. Knowing that we were among a very lawless set, I determined they should see that even these little implements were dangerous. Stepping out fifteen paces I turned round, cocked my pistol, fired, and made a hole in the paper. The sultan and his people evidently thought this a trick; he said something to his son, who instantly ran off into the yurt, and brought to his father a Chinese wooden bowl. This was placed upside down on the stick by his own hand, and when he had returned to a place near me, I sent a ball through it. The holes were examined with great care; indeed, one man placed the bowl on his head to see where the hole would be marked on his forehead. This was sufficiently significant. The people we were now among I knew to be greatly dreaded by all the surrounding tribes; in short, they are robbers, who set at naught the authority of China, and carry on their depredations with impunity. On looking round, I noticed that a set of daring fellows had been watching my movements.'

The banquet then followed. A small space in front of the sultan was left cleared, the male elders near him, and fifty men, women, and children assembled in front; the boys sat behind the men, and behind them successively, the women, girls, and dogs. After ablutions with warm water, the cooks brought in long wooden trays, piled up with heaps of boiled mutton, garnished with rice, when each man drew his knife and fell to. 'The Kirghis who sat nearest the trays selected the things he liked best, and after eating a part, handed it to the man sitting behind; when again diminished, this was passed to a third; then to the boys; and having run the gantlet of all these hands and mouths, the bone reaches the women and girls, divested of nearly every particle of food. Finally, when these poor creatures have gnawed till nothing is left on the bone, it is tossed to the dogs.'

A hunting excursion then followed in a day or two, the sultan's three hunters leading the van, followed by eagle-bearers. The eagle had shackles and a hood, and was under the charge of two men. They had not gone far when several large deer rushed past a jutting point of reeds, and bounded over the plain. In an instant, the bearcoote was unhooded and his shackles removed, when he sprang from his perch and soared up in the air. Mr Atkinson watched him ascend as he wheeled round, and was under the impression that he had not seen the animals; but in this he was mistaken. He had now risen to a considerable height, and seeming to poise himself for a minute, gave two or three flaps with his wings, and swooped off in a straight line to his prey. The deer gave a bound forward, and fell, the bearcoote having struck one talon into his neck, and the other into his back, while he tore out with his beak the animal's liver. Wild goats, wolves, and even foxes are hunted in this

way. The bearcoote is unerring in its flight, unless the quarry can escape into holes in the rocks.

We have many other lively descriptions of life in the Mongolian Steppe, and of sublime scenery in the mountainous regions. The whole territory is among the least known in the habitable globe.

We conclude with a few traits of Barnaul, which is the centre for the administration of the mines of the Altai. The governor, Tomsk, who is chosen from the mining-engineers, is at the head of this department. He resides three or four months of the year at Barnaul, and under him is the chief director of the mines, who must visit every smelting-work in the district once every year, travelling several thousand versts in a mountainous country, or descending rivers in rafts. His power is extensive, and he has a population of about 60,000 miners, peasants, and officers under his charge. It appears that convicts have not yet been sent to work in the mines of the Altai. Every summer, eight or ten young officers are sent into the mountains, each with a party; and the chief in Barnaul assigns to him the valley to be examined by his company. They start in May, with provisions of bread, sugar, tea, and brandy, their animal food being the game they kill. The officer receives a map, and then the experiments commence—the officer noting down how many *tolotniks* of gold can be obtained from the hundred poods of sand. Several places are tried, and on this the director in Barnaul decides what gold is to be worked. While one party are seeking gold in the sand, another party are seeking silver in the rocks. These operations are usually concluded by the middle of October, when they return home to Barnaul.

Barnaul is well stocked with smelting-works, chemical laboratories, public offices, and private dwellings, all connected with the mining operations; and during the winter, which is undoubtedly very severe in point of climate, balls, soirees, and concerts are given. It has also a bazaar, where European articles, fashions, French silks and bonnets, are sold, besides delicacies of the table, comprising English porter, Scotch ale, and French and Spanish wines. There is also a museum at Barnaul, comprising choice specimens of Siberian minerals, and stuffed Siberian animals, including four tigers, which came from the Kirghisian Steppe; their capture having, in two instances, proved fatal to some of the peasants engaged, who had thought to expel the intruder from their farms by pea-rifles and hay-forks. To conclude, such is Barnaul, the capital of the most productive mining district of Siberia.

THE BONSPIEL.

CAN our English readers imagine a Scottish loch or lake in the winter season after four or five days' hard frost—a beautiful white plain surrounded by white heights, and all under the stillness which allows of an ordinary sound being heard at a great distance? The existence of such circumstances in nature has given birth to an appropriate game which might be described generally as *bowls played on ice*, though with certain peculiarities, the chief being the use of flat-bottomed stones to slide, instead of bowls to roll, said stones being furnished with handles to grasp by, much in the manner of smoothing-irons.

The frost having set labour free in some degree, men assemble at the loch, and give the day to this ancient national sport, usually wakening into wild excitement and glee a scene which would otherwise wear the torpor of death. To stand on a height near by, and see the bustle going on below: to hear the

roar of the stones careering along the icy surface, and the shouts and cackinnations of the players as these knock against each other and settle in their respective destinies, is, we can assure our friends, no commonplace amusement. To be, however, an actual player—a curler—'a keen, keen curler,' as the natives phrase it—is something far beyond all this; for there are joys in curling that none but curlers know. How else could it be that there are local clubs, county clubs, and a national association of clubs, binding all ranks and denominations of people together for the enjoyment of this game? How else could it be that curling has its almanacs, its annual, its literature; that, curling is a kind of second freemasonry in Scotland?

There is a kind of piquancy given to this game by the very uncertainty of the means and opportunities of playing it. The curlers watch for a hearty frost, woo it as mariners do a wind, and when it comes, 'snatch a fearful joy.' That no time may be lost in making an appointment, a flag hoisted on a hill-top sometimes informs a district of ten miles' radius that the loch will bear, and the game hold. Then are seen farmers, lairds, village tradesmen, ministers, ploughmen, and shepherds, converging to the rendezvous, all full of charming anticipation. Society is at once convulsed and cheered by the affair. No great regard is paid to common distinctions in making up the game. The laird is glad to have a clever ploughman on his side. Masters and servants often play together. The distinctions most thought of are local: the people of one estate or parish will often play against each other—or it may be county against county—in which cases the match is termed a *bonspiel*. Each man requires at the ice two curling-stones and a broom wherewith to sweep. Two marks, called *tees*, being made on the ice at the distance of thirty-eight yards, and several rings drawn round each, the players arrange themselves, perhaps four, six, or eight on a side; each with two stones to play, and each side having a director or chief called a *skip*. The space of ice between the *tees* is called the *rink*. The object of course, for each side, is to have as many of its stones as possible in positions as near to the *tee* as may be. When a stone fails to reach a certain limit, called the *hog-score*, it is laid aside. On any one, therefore, appearing likely to be laggard, all the players on that side busy themselves in sweeping the way before it. 'Soop, soop!' becomes a great cry among the curlers. An English stranger once remarked that he heard them always crying for soup, but no soup ever came; much, no doubt, to his disappointment. When one side counts thirteen, twenty-one, or thirty-one, as may be, before the other, it has gained the victory.

There was lately a *bonspiel* in a well-known district of the southern Highlands of Scotland, and a characteristic account of it having been obligingly sent to us by one of the players, we hasten to insert it, as perhaps the best means of conveying an idea of this national game. The original language is so appropriate that, notwithstanding its being possibly obscure to some readers, we have left it almost unchanged.

'You remember,' says our correspondent, 'that I promised to send you something of our *bonspiel* with the Mitchell-hill lads, whenever it should be played. Well, it was a bad winter for frost: not aboon two or three days of it till Candlemas; but at last we got

a hard one for about a week, and a' was right. So, one afternoon, two of the Mitchell-hill lads came to us at Blendewan, and asked if we had any objections to meet them next day, providing the frost held. They said they had been at the laird's, and that he was willing to come out, and bring a guest of his—Sir Alexander Gordon—along with him; that the herds of Stanhope and Eildon were to be there; and that Wully Wilson, the wright, and Andrew Blair, the smith, were both keen to give us our revenge for last year's drubbing. So I mentioned that if I could get our side made up in time, we would meet them on the ice by ten o'clock next morning. The two lads were rather crouse about the match, and said they hoped we would not let them win so easy a victory this year as last. I said nothing; but, thinks I, wait a wee, my lads, and we'll see who will crawl the loudest the morn. So away went Johnny Armstrong and Peter Blackstocks back to tell the laird and the rest o' their folk that we would meet them, on the understanding that if anything happened to interfere, I was to send them a line not to come.

'Well, Mr Editor, I ken ye like particulars; so ye see I threw my work bye, put on my cap, and went through the village, speering at the folk if they would be ready to come forrit next morning; and I must add that I was very fortunate too: but who could refuse the chance o' playing a *bonspiel* for the honour o' Blendewan! I soon got the minister to promise, and the precentor too (Jamie Forgrieve, the miller, could not be spared from home); Adam Prentice, the old herd, said he would be our man; Sandy Grieve, the tailor, swithered a wee, but promised at last; so there was five, and we wanted other three—but these I kent where to find. I gaed the length o' the Fairy Knowe, and secured Mr Thompson—a keen hand—and a boarder of his, who was learning farming—another keen hand, and a great wag; and I made up the number with Isaac Melrose, the cadger. Isaac's horse was not sharpit for the frost, and was sair fatigued forbye; so the carrier was glad of the opportunity o' joining us against the Mitchell-hill curlers.

'It was late before I got our side made up, and my wife was beginning to give me up for lost. But ye'll mind Nancy, sir, and ye ken she's no ill to temper down! Well, everything was settled, and I sent two lads to the pond early in the morning, to sweep it clean and make the rink; and just as I was getting my stones ready, the laird and Sir Alexander drove up to my door. I went out and gave them time o' day, and the laird speered at me if we were prepared, as the players on his side were just coming down the road in a cart. I told him we were all ready, and that our chaps had gone down to the pond with the minister a few minutes before. Wi' this, up drove the Mitchell-hill cart with the six rival players; but when they saw the laird and Sir Alexander cracking with me, they never halted, but drove straight on. The laird got me in his dog-cart, and gave me a lift down; and when we got to the ice, his servant drove the gig back to the nearest farmhouse, where the beast was put up.

'Well, Frank,' says the laird, 'what sort of trim are you in?'

'Oh, sir,' says I, 'I'm thinking I'm in kind o' guid trim.'

'That's right, Frank. See and don't let us run away with the match, as we did last year.'

'Well, I think, sir, it will tak a' your pouther to master us this time.'

"Think so, Frank? Why, here's Sir Alexander Gordon on our side, and he's one of the best curlers in the country."

"That may be, sir, but he'll maybe find his match in the cadger."

'In the meantime the minister and two gentlemen were holding a preamble about which side was to be the winner, and I must say the gentry were just as keen as us chaps. But you will better understand how the match was made up if I give you the players' names on each side, in the order of their playing:

Our Side—Blendswan.

1. Rev. Mr. Montgomery.
2. Adam Prentice, the sould
3. John Donaldson, the precentor.
4. Sandy Grievie, the tailor.
5. Mr. Thompson o' the Fairy Knowe.
6. Mr. Robert Shihald, his boarder.
7. Isaac Melrose, the cadger.
8. Myself, Francis Baldwin, souter (skip).

Their Side—Mitchell-hill.

1. Wully Dalgleish, the Stanhope herd.
2. Tam Anderson, the Eldon herd.
3. Wully Wilson, the wright.
4. Andrew Blair, the smith.
5. Johnny Armstrong, the laird's overseer.
6. Mr. Dalrymple, the laird.
7. Sir A. Gordon, a guest at the Ha'.
8. Peter Blackstocks, the laird's forester (skip).

'Well, sir, in about a quarter of an hour the rink was ready, the stones lying a' thegither about the brugh (the brugh, ye'll remember, is the ring round the tee), and every man had his besom in his hand. Just to try the keenness o' the ice, we sent our stones to the other end—of course not counting. Sir Alexander, I must admit, laid on his stones well, and, faith, I began to think he was like to be fashious a wee, from his easy style and curlier-like appearance. In driving his two trial-shots, the laird asked him to tak the wick—which means to strike the stone on the side, and glance off at an angle—o' one o' Tam Anderson's stones; which, faith, he managed; and his second one he drew to the laird's besom, and lay. I saw our chaps looking rather queer when they saw the shots played, but I counselled them never to mind that, for he couldna aye play the same.

"Now, Frank," says the laird, when I was about to play my trial-stones down the rink, "here's a chance for you; raise that stone."

'I played a fine shot; but being out o' practice, I couldna be expected to do very well at first, so, instead o' raising (which, as you know, means just striking it fair—your own stone lying) the stone at the laird's besom, I missed it, and took an outwink on another stone, which sent it close to the tee. Though the laird nickered and laughed at my miss, he wassa aye ready to laugh a while afterwards.

'For the first two or three hours, the spirit of the game was never very high; both sides played tolerably well, but without that roaring fun which I have known to accompany every "end" at curling-matches like ours; in fact, the company was beginning to get a thought dull, though the scoring was even enough to have excited more enthusiasm between rival parties, when a halt was called, the besoms flung down, and half an hour was allowed for bread and cheese. There was a good deal of sport going on while we sat on the banks of the pond, all mixed thoroughlier; the laird and the cadger were holding a confab about something I couldna hear, and Sir Alexander and auld Adam Prentice were smoking their pipes thegither as crouse as ye like.

"Now, Frank," says the laird, "we'll have a dram together. I know that's what you want."

"Weel, laird, may be if we had had one sooner, we might have shewn you more sport; but better late than never, if it's your pleasure!"

'So we all got a dram—a guid ans too, which I must say improved the spirits of the company most

wonderful, and then we commenced to curl in earnest. It was but child's play before: we begood to play like men now.

'I will not take up your time by alluding to the various outs and ins of the game either before the mid-day halt, or up till nearly the finish; but I will go on to relate how we gained the bonspiel after as tough a contest as the Mitchell-hill players would ever wish to have.

'At 8 o'clock, P.M. the game stood thus: Mitchell-hill, 24; Blendswan, 29—the latter wanting but two to be game.

'The closing shots were lost and won thus: Mr. Thompson o' the Fairy Knowe played uncommonly well, and his boarder chield not amiss; and Johnny Armstrong, the forester, and Wully Wilson, the wright were bye-ordinar guid. Wully played his first stone a perfect pat-lid on the tee, and with his second guarded it within two feet. The first remained a pat-lid till the end was played out, though his guard was chippit frae its place. They were unnoo near getting other two forbye this one, and indeed they were three shots in, till my last stone inwicked from one and curled in second. They were now twenty-five to our twenty-nine.

"We're gradually making up on you, Frank," the laird quietly observed. "You'll have to play your best, or we'll be upsides with you yet."

"That'll be seen next end, Maister Dalrymple, or I'm cheated."

'And the next end began by Wully Dalgleish, the Stanhope herd, making a hog. "That's one off the ice, at any rate, says I to our side; and you'll see more o' that kind before the end's played out, for the ice is beginning to be dour. Now, lads," says I, "this end must decide it; there's nae use in hinging on or saying any mair about it: we want but two; the minister's to be first shot this time, and, faith, I'll be second myself."

'And up comes the worthy minister's stone, fine bowe-ice—that's straight along the centre o' the rink, as you know, sir—and lies within three feet o' the tee. The herd's second stone was better than the first, and lay a goodish side-shot. They were on their metal, and playing their very best; sometimes putting in plenty o' pouter when it was needed, and whiles playing gently for a draw when it was needed. Three hogs had been already played through over-caution. Adam Prentice shewed that he was still the sould man, and a swankin' player into the bargain. The tailor and precentor did their best, which, however, was by no means bye-ordinar; but Mr. Thompson and his boarder proved themselves curlers o' the richt sort, and played every shot in grand style. On the other side, the players were just as good—not a hair to judge by, and each man following the skip's direction terrible weel. Well, sir, the stones were lying well about the brugh, and they were two shots in. It was Sir Alexander's turn to play, and fortunately for us, he unintentionally opened up a port—which you know means a clear passage between stones—the very thing they should have avoided, but just what we wanted; and then the cadger stood ready to play.

"Now, Isaac," says I, "ye ken as weel as I, what to play fur. The port is open, and they are two shots in."

'The cadger's stone is delivered, and, for a wonder, he misses the port; however, "She's coming forrit well enough, lads," says I; "scoop her up, scoop her up, so-op her weel—there now—come: that's as good as the port yet. You've positively brought one of the minister's stones in for shot." And great was the consternation on their side at this unlooked-for turn in our favour. However, Peter the skip told them not to mind that, for the port was still open for Sir Alexander's second and last stone. And to that

gentleman's praise I will say, he took the port in first-rate style; and had he given his stone a little less poulder, he would have retrieved: but his stone curled away to the other side o' the brugh, and lay outside.

"Isaac, man, I want you to close that port—draw to my besom; and if you do touch any of the stones, break an egg, and no more, for they're both against us."

"Put your bannet on the ice, where ye want me to lie, Frank."

"I'll do that, my man: there's the verra bit." And by one of the cadger's best strokes, the port was filled.

'It was now Peter Blackstock's turn to play, so the laird acted skip for him.

"Peter, if you'll take an inwick on this stone at my besom, I'll make your wife a present of a new gown."

"I saw the stroke fine, for I ettled [intended] to play it myself when my turn came; and says I to myself: 'Oh for a miss from Peter, though it should lose a gown to the wife!' Peter's hand was trembling with anxiety, and he fairly bungled the stroke altogether.

"Od, laird," says I, "ye shouldna have spoken about the gown till after the stroke was played, for you've fairly dumfounded the forester's nerves!"

"Now, Frank," says the cadger, "I wasna feared for anything the forester could do, for I kent it wasna one o' his kind; but that's not to say I'm frightened for you. Try for the verra same stone; and if ye tak the wick at my besom, we're game."

"Stand awa' from the stone, Isaac, my man. I ken what's wanted: here goes." And up comes the stone. "I believe she has it—no—yes, she has it. Dinna scoop, callants—she's there, she's there, she's there!"

"Frank, you're a gentleman (the first time I was ever called that before, Mr Editor), and no mistake!"

'A kind of unnatural calmness now spread over the laird's countenance; and after the bursts of enthusiasm had subsided on our side, a perfect silence reigned over the rink, for on the forester's last stone depended all their hopes of cutting us out yet; twenty-nine before, we were now thirty-one, or game, unless the forester's last stone should render his side a service by knocking out one, or maybe both, of ours. In a calm, clear voice, the worthy laird informed Peter what he, poor chap, already knew too well—namely, how the game stood.

"There's but one chance left, Peter—a forlorn-hope, and it's do or die. Come up the ice all your force, and take that stone" (pointing to one of ours at some distance in front of the tee).

'The forester eyes with an air of determination the group of close-set stones that close up every road to the tee; he sets himself firmly in his crampets, to the precise posture requisite for a dashing stroke; his stone steadies for an instant in the air behind him, and away it careers with tremendous force.

"Splendid!" cries the laird, the only word he has time to say. "Mind your feet," cries Sir Alexander Gordon, as half-a-dozen stones are sent scattering in all directions. But to no purpose; for though the minister's stone was slightly touched, it still remained first shot, and mine second. "Game—game—GAME!" and up went our bonnets fiesin' in the air.

"Give us your hand, Maister Montgomery," says I, "for you and me's played unco weel;" and the worthy pastor and I shook hands up to the shoulders.

'But you must be tired o' me by this time, Mr Editor; so I will only add that the laird had us all up at the Ha', where we had plenty o' everything, not forgetting beef and greens, and plenty of good ale to synd it over. I'll maybe write another account if we are spared to see another year; and in the meantime,

if you will be good enough to send us a few copies o' the Journal, for the chaps to see their names in, you will oblige your old friend—the SKIR.'

THE CITY OF MEN.

HOLINGSHEAD, in his *History of Mancuniensis*, repeats a prophecy well known to all northern antiquaries:

When all England is aloft,
Weel ar they that are in Christ's Croft;
And where should Christ's Croft be,
But between Ribble and Mersey?

And however learnedly Camden may dispute the etymology which derives the name of Manchester from the English tongue, instead of referring it to a purely British origin, the former will still find favour in our eyes, since, as he tells us, its good people call the city Manchester because it is a 'city of men!' And they are right, those good people; that is a conclusion I have come to from a recent close, however brief, inspection of themselves; and I give my vote accordingly for the English etymology.

If ever a place could apply to itself the account Black Topsy gave of her origin, it would surely be this great capital of the north of England: for when one sees its most important streets, with scarcely two houses together of uniform appearance, and with commerce sitting enthroned at one end to dispense millions of wealth, while at the other the huckster hawks his petty wares from a stall; its princely edifices hustled by mean low-browed shops; its warehouses of palatial vastness and decoration, side by side with factories that are mere brick boxes; and its long, long rows of poor streets, bare, plain, and monotonous as the calico which the inhabitants have spent their lives in producing: he is by no means inclined to question the Topsyman surmise—"pects I growed." Yes, we have here the America of England, not certainly in the shape of a Philadelphia or a Washington, no deliberate brick fulfilment of a paper plan, but a heap of spontaneously formed Smithvilles and Jonesvilles, that have risen up impulsively just when, and where, and how the need of the moment required, each capitalist centre having apparently given birth to its own surrounding accretion, and all together forming an inartificial and unattractive whole.

It is a disappointment, too, to see the coal-born haze ever shutting out heaven's sunshine, and sprinkling all things with its dismal flakes, while the very mud, soot-tempered, seems muddier than even the renowned compound of London. It is a disappointment, because not very long since we were told that these grim furnaces were to be endowed with the saturnian power of devouring everything they generated; and the City of the Thames was admonished to look to the City of Men, and profit by the example. But now while roses even have learned to bloom in the purified Temple atmosphere, smoke, checked but for a time in Manchester, again rears its head, and flings out its serpent-wreaths from nearly every stalk.

There is something repulsive in shops of inferior dimensions, and generally shabby appearance, announcing their ownership and wares in colossal inscriptions, letters three or four feet high, while the legends of vast warehouses and factories, in the modesty of conscious worth, lurk upon door-posts, or peep in smallest type from beneath some deep-arched portal. Yet Manchester streets may be irregular, and its trading inscriptions pretentious, its smoke may be dense, and its mud may be ultra-muddy; but not any nor all of these things can prevent the image of the great city from rising before us as the very symbol of civilisation, foremost in the march of improvement, a grand incarnation of progress. That commerce has

had no unduly materialising influence upon those engaged in it here, that vast building at Old Trafford which rose at their bidding, and whose glorious contents were collected under their auspices, presents sufficient proof; but there is no lack of minor evidence. 'When any of these great cotton-lords gives me a commission for a picture,' observed an artist, a Londoner by birth, but now resident in Manchester, 'they always speak and seem to feel as if it were they who were the obliged party.' There is nothing among them of the too common vulgarity of the petty tradesman, none of that demand for a servile gratitude so often one of the trials most galling to genius. Again, in the rooms of the Royal Institution hangs a picture of an old French abbé, equally attractive on the grounds of its merit and its history. It is the work of a French lady who devotes all the produce of her art to purposes of benevolence, and was originally sent here to an exhibition by native and foreign artists. A gentleman delivering a lecture on this exhibition, commented on the extraordinary excellence displayed in the picture, and regretted, as it was still unsold, that it should be allowed to leave the country. He had no sooner ceased than the appeal was responded to; the picture was at once purchased, and at rather a high price, by one of his hearers, who then observed that he thought he could not do better than present it to the Institution with which they were connected: and, accordingly, there it hangs at this moment on the walls of that noble building. Nor is this spirit confined to the upper classes. On the recent exhibition of the competition-works of students in the schools of art, it was truly gratifying to see what flocks of rough-looking, ill-dressed people crowded in the evening to the rooms, and to observe with what attention they examined the various merits of even chalk-shadings and pencil-outlines; and people like these are hardly to be suspected of affecting an interest they do not feel.

Much has been said—perhaps too much—about the humanising influence of art; but, simultaneously with the fine feeling we have alluded to, the men of the City of Men are unquestionably more than usually devoted to the small amenities of life. An illustration of this may be met with in every street in the polite and painstaking anxiety of the passers-by to direct a stranger on his way. The minute directions, patiently repeated when not understood, will even sometimes be followed up by a long walk *out of the way*, in order to make sure that the road shall not be mistaken; and no touched hat and appealing look at the end of the journey imply that 'your honour's health' was the expected conclusion. The general intelligence, also, of the lower classes is remarkable. A boy in a warehouse, a lad from the factory, will not only readily reply to any inquiries as to the processes going on in his own department, but will shew himself equally conversant with the general details of the business, and in respect to the materials employed, the amount of trade, and the average of wages. Returning once from an excursion to inspect a mill a short distance from Manchester, I happened to remark to one of my companions that a medical friend of mine had been deploring the prevalence of female labour in the factories, on the ground that the feminine character was exclusively adapted for domestic seclusion, and invariably deteriorated in congregations even of her own sex, when a clear though somewhat feeble voice behind begged to be permitted to make a remark upon the subject. I was then in a third-class carriage, for the very purpose of studying the character of the masses, and I turned quickly, and saw the pale thin face and sightless eyes of a man about thirty, neatly but very meanly clad, and evidently of the lower rank. 'You are speaking,' said he, 'of the way the female character is injured in factories: the causes may be

easily traced. The children are the chief workers in a family here; they are regarded according to what their labour will fetch, and as soon as they are old enough, are sent forth to earn. The money-power must always be the ruling power: the parents, therefore, who are often idle, are subordinated to the children, on whose wages they mainly depend; parental authority is overthrown; the harmony of family-life broken up; and the female character of course injured in proportion.'

This was at least the substance of the speech, though it gives but an imperfect idea of the clearness of his argument, or the felicitous language which conveyed it. Our pleased surprise was not lessened when an individual, of equally humble appearance, in another compartment, made some remarks on the comparative characters of the factory-worker and agricultural labourer, and in words more homely than those of the blind speaker, but not less fluent, maintained his view of the question. The subject veering round to the physical differences in different ranks, led to a discovery of his occupation, for on my mentioning having heard that hatters kept assorted sizes of hats for the various classes of society—gentlemen, servants, mechanics, &c.—and that the gentlemen's were usually the largest, he observed that at least the gentlemen's servants were invariably the smallest; adding—'And my opinion may be received as something worth on this subject, for I am a hatter.'

And how is this general intelligence and cultivation to be explained? One cause of the advance, though not of the tendency, may be easily traced. When the question of the free-library system was first discussed, Manchester was one of the first towns to demand the institution; and amid long mean streets, well fitted to supply its readers, stands one of the noblest efforts made in the cause of human culture, the Camp Field Free Library. Here a large and handsome ground-floor hall is filled with desks and tables devoted to periodical literature; and the poorest wanderer may drop in and acquaint himself with the chief events and great discussions of the day. Here, if it be washing-day at home, and the wet linen still hangs in the one room, or the workman is weary with his labour, and his children are ill or noisy, what a resource is within his reach when he can repair to this lofty, well-lit room, with its comfortable seats and unfailing stores of amusement! Here, too, is a circulating library for home-reading, available on presenting a recommendation; while a staircase, profusely adorned with excellent engravings, leads to a large room containing a library of reference, the valuable books of which can be perused only within the room, but are freely handed to any applicant without question or introduction.

But, in addition to the kind of intelligence alluded to, there is a certain completeness in the mind of Manchester, which recognises the mutual dependence of the physical and intellectual nature. Here, for instance, public baths and wash-houses were founded some time before they made their way to London. Even swimming-baths for females have begun to make some progress, at least in principle: at Peel Park, the Gymnasium affords not only to sedentary men and boy-workers an opportunity of healthful exercise, but a secluded portion of the grounds is set apart for girls, to allow them also some small chance of proper muscular development. Might not the authorities of the London Parks take a hint from this great charity, and so enable many a poor girl who sits all day working bugles or quilling blond, or making artificial flowers, to enjoy the means of obtaining stronger limbs and a straighter spine?

Leaving Peel Park, the eye is caught by an announcement at its gates concerning a school in connection with the Salford Institute; and here again a striking fact presents itself. Not only is general

education offered at a very moderate rate, but there are also special classes for instruction in various arts; and among these one, at five shillings a quarter, a class for dress-making. Now, any one who has kept servants can hardly have failed to remark, how important an influence the being able to make a dress for herself, has upon the female domestic—how much neater an appearance she can maintain—how much better able she is to restrict her expenditure to something less than her earnings—and how, besides, as an interesting occupation for her leisure hours, it tends to prevent their being wasted, as is too often the case, on a debasing literature, if it be lawful to give it the name. And the visitor of the poor sees, still more strikingly, the vast difference this knowledge makes in a poor man's home, when his wife is 'handy at her needle,' and out of one old gown can make two new frocks.

As another educational effort pointed out by social science, one mill-proprietor mentioned, that as soon as the buildings for the purpose were completed, he intended to open a school for teaching cookery to girls. This, it is true, has been done in London; but the idea was not born there, for local history informs us, that as long ago as 1720, 'in order to perfect young ladies in what was then thought a necessary part of their education, a pastry-school was set up in Manchester, which was frequented not only by the daughters of the towns-people, but those of the neighbouring gentlemen.' It were well that young ladies in the present century should not deem it a vulgarity to learn to make a digestible pie-crust; but the principle which makes the economical preparation of food a part of a factory-girl's education, is even more important. And considering the fact, that towards the recently completed chapel in connection with these intended schools, the 'hands' of this one factory, in number about 1000, contributed no less a sum than L.300, it need hardly be feared that they will not appreciate any educational advantages.

But social science applies itself not merely to the claims of poverty, it is her part also to see that those who have money to spend shall have their penny's worth for their penny. The Manchester omnibus may be instanced, which provides for its general three-penny fare a lofty, well-ventilated vehicle, with fair room for the lower extremities of all.

It has been admitted that the city's appearance is not very prepossessing; and if this be the case by day, it certainly gains little by night. But all honour to this nocturnal dimness, for it is due to the early closing: and so well is this movement carried out, that a great number of the shops are shut as early as seven; and very few are open after eight. When to this daily margin, reclaimed from the labour-tide, the Saturday half-holiday, now so general here, is added, we may conceive how vast a stock of leisure is gained for all classes, to afford room for social improvement and social happiness.

But it may not be amiss to advert to some of the more latent causes that have led to the advancement of this interesting city. McCulloch, speaking of England at large, says, that 'to excel in machine-making is to excel in what is certainly the most important branch of manufacturing industry. Superiority in any single branch, except this, may exist simultaneously with great inferiority in others; but eminence in the manufacture of machinery is almost sure to lead to eminence in every other department.' We may suppose, then, that the amount of intellect required for the perfecting of the processes here carried on, cannot all be expended on this primary object; and thus a surplus is left to be devoted to other kinds of improvement.

In regard to the handiwork itself, Mr Stevenson, in the article on 'English Statistics,' in the *Edinburgh Encyclopædia*, lays much stress on the practice, almost

universal in factories, of piece-work payment, as giving the workmen an interest in industry, and an inducement, to execute the greatest amount of work in the least space of time; such an influence even reacting upon day-labourers by rousing their emulation, and inducing them, in order to avoid invidious comparisons, to make exertions unknown in other countries.

Dr Ure, again, in his *Philosophy of Manufactures*, thus comments on the kind of employment here chiefly followed: 'Occupations which are assisted by steam-engines, require for the most part a higher, or at least a steadier species of labour, than those which are not; the exercise of the mind being then partially substituted for that of the muscles constituting skilled labour;' and this, as he adds, is always paid more highly than unskilled. He also observes, that 'of all the common prejudices with regard to factory-labour, there is none more unfounded than that which ascribes to it excessive tedium and irksomeness above other occupations, owing to its being carried on in conjunction with the unceasing motion of the steam-engine. In an establishment for spinning or weaving cotton, all the hard work is performed by the steam-engine, which leaves for the attendants no hard labour at all, and literally nothing to do in general, but at intervals to perform some delicate operation, such as joining the threads, &c.' His remarks apply especially to the children, of whom three-fourths of the number employed are engaged in piecing; at which he computes that a child working even twelve hours a day, and attending two mules, would yet have six hours of inaction, occurring at periods of three-quarters of a minute or more at a time, and mentions that 'spinners sometimes dedicate these intervals to the perusal of books.' This, one would suppose, can scarcely be generally or easily done, but at least such snatches of leisure occurring so largely and regularly, must afford favourable opportunities for cultivating the reflective faculties; and that they are thus made use of, seems to be proved by the general intelligence which prevails.

While, then, this wondrous city, this giant of the English north, is thus advancing with seven-leagued strides in the path of progress, let no mere adventitious circumstances cause it to be viewed unfavourably; let no unworthy jealousy prevent the full recognition of that foremost position it is pressing forward to. That it is a powerful rival in the race, even compared with the proud metropolis, must be admitted when we consider all it has done and is doing for social amelioration and national prosperity; its devotion at once to commerce and industry, to science and art; its fostering of kindly feeling and cultivation of intellect; its attention to the requirements of those who can afford to purchase comfort, and the wants of those who have nothing to pay; its provision for every bodily demand, and every mental and moral need. Herein, indeed, in this universality of genius which cares for everything, and overlooks or neglects nothing, lies the great secret of its success. One of the most eminent inhabitants of the city, accompanying a party in the inspection of one of its great establishments, introduced them to the steam-engine which keeps in motion all the machinery on the premises, with the exclamation: 'Here is the real Manchester Man!' It may at least symbolise him. Making its energy felt throughout every part, its influence as active in the remotest corner as in its immediate neighbourhood; not putting forth its efforts in one mode of operation only, but doing whatever is to be done, lifting or pressing in one place, rolling or stamping in another, taking in here, sending out there, just as need may require; and with no capricious intermittent exertion, but in steady, unwearied diligence moving all, regulating all, the tiniest pin not eluding its grasp, the hugest wheel not beyond its capacity; this mighty worker is indeed

no inapt image of those who evoke its powers, and who, not only by using its services, but by imitating its action, have obtained the present high place, and the prospect of a yet loftier future, for the City of Men.

OCEOLA:

A ROMANCE.

CHAPTER LV.—THE VOLUNTEERS.

Mr sister kept her word. I saw no more of her for that day, nor until noon of the next. Then she came forth from her chamber in full riding costume, ordered White Fox to be saddled, and, mounting, rode off alone.

I felt that I had no power over this capricious spirit. It was idle to attempt controlling it. She was beyond the dictation of fraternal authority—her own mistress—and evidently determined upon having her will and her way.

After the conversation of yesterday, I felt no inclination to interfere again. She was acquainted with my secret; and knowing this, any counsel from me would come with an ill grace, and be as ill received. I resolved, therefore, to withhold it, till some crisis should arrive that would render it more impressive.

For several days this coolness continued between us—at which my mother often wondered, but of which she received no explanation. Indeed, I fancied that even her affection towards me was not so tender as it used to be. Perhaps I was wronging her. She was a little angry with me about the duel with Ringgold, the first intelligence of which had gravely affected her. On my return I had received her reproaches, for it was believed that I alone was to blame in bringing the affair about. 'Why had I acted so rudely towards Arens Ringgold? And all about nothing? A trumpery Indian belle? What mattered it to me what may have been said about the girl? Likely what was said was nothing more than the truth. I should have behaved with more prudence.'

I perceived that my mother had been informed upon most of the material points connected with the affair. Of one, however, she was ignorant. She knew not who the 'trumpery Indian belle' was—she had not heard the name of Maïmea. Knowing her to be ignorant of this, I listened with more calmness to the aspersive remarks.

For all that, I was somewhat excited by her reproaches, and several times upon the point of declaring to her the true cause why I had called Ringgold to an account. For certain reasons I forbore. My mother would not have believed me.

As for Ringgold himself, I ascertained that a great change in his fortunes had lately taken place. His father was dead—had died in a fit of passion, whilst in the act of chastising one of his slaves. A blood-vessel had burst, and he had fallen, as if by a judgment of God.

Arens, the only son, was now master of his vast, ill-gotten wealth—a plantation with some three hundred slaves upon it; and it was said that this had only made him more avaricious than ever.

His aim was—as it had been that of the older Ringgold—to become owner of everybody and everything around him—a grand money-despot. The son was a fit successor to the father.

He had played the invalid for a while—carrying his arm in a sling—and, as people said, not a little vain of having been engaged in a duel. Those who understood how that affair had terminated, thought he had little reason to be proud of it.

It seemed the hostility between him and myself had brought about no change in his relations with our family. I learned that he had been a constant

visitor at the house; and the world still believed him the accepted suitor of Virginia. Moreover, since his late accession to wealth and power, he had grown more than ever a favourite with my ambitious mother. I learned all this with regret.

The old home appeared to have undergone a change. There was not the same warmth of affection as of yore. I missed my kind, noble father. My mother at times appeared cold and distant, as if she believed me undutiful. My uncle was her brother, and like her in everything; even my fond sister seemed for the moment estranged.

I began to feel as a stranger in my own house, and, feeling so, stayed but little at home. Most of the day was I abroad, with Gallagher as my companion. Of course, my friend remained our guest during our stay on the Suwanee.

Our time was occupied, partly with the duties upon which we had been commanded, and partly in following the amusement of the chase. Of deer-hunting and fox-running we had an abundance; but I did not enjoy it as formerly; neither did my companion—ardent sportsman though he was—seem to take the delight in it which he had anticipated.

Our military duties were by no means of an arduous nature, and were usually over before noon. Our orders had been, not so much to recruit volunteers as to superintend the organisation of those already raised; and 'muster them into service.' A corps had already advanced some length towards formation, having elected its own officers, and enrolled most of its rank and file. Our part was to inspect, instruct, and govern them.

The little church, near the centre of the settlement, was the head-quarters of the corps; and there the drill was daily carried on.

The men were mostly of the poorer class of white settlers—small renting planters—and squatters who dwelt along the swamp-edges, and who managed to eke out a precarious subsistence partly by the use of their axes, and partly from the product of their rides. The old hunter Hickman was among the number; and what did not much surprise me, I found the worthies Spence and Williams enrolled in the corps. Upon these scamps I was determined to keep a watchful eye, and hold them at a wary distance.

Many of the privates were men of a higher class—for the common danger had called all kinds into the field.

The officers were usually planters of wealth and influence; though there were some who, from the democratic influence of elections, were but ill qualified to wear epaulettes.

Many of these gentlemen bore far higher official titles than either Gallagher or myself. Colonels and majors appeared to be almost as numerous as privates. But for all this, they did not demur to our exercising authority over them. In actual war-time, it is not uncommon for a lieutenant of the 'line,' or the lowest ensign of the regular army, to be placed in command of a full colonel of militia or volunteers!

Here and there was an odd character, who perhaps, in earlier life, had 'broken down' at West Point, or had gone through a month of campaigning service in the Creek war under 'Old Hickory.' These, fancying themselves *as fait* in the military art, were not so pleasant to deal with; and at times it required all Gallagher's determined firmness to convince them that he was commander-in-chief upon the Suwanee.

My friend's reputation as a 'fire-eater' which had preceded him, had as much weight in confirming his authority as the commission which he brought with him from 'head-quarters.'

Upon the whole, we got along smoothly enough with these gentlemen—most of whom seemed desirous of learning their duty, and submitted to our instructions with cheerfulness.

There was no lack of champagne, brandy, and cigars. The neighbouring planters were hospitable; and had my friend or myself been inclined towards dissipation, we could not have been established in better quarters for indulging the propensity.

To this, however, neither of us gave way; and our moderation no doubt caused us to be held in higher esteem, even among the hard drinkers by whom we were surrounded.

Our new life was by no means disagreeable; and but for the unpleasantness that had arisen at home, I could have felt for the time contented and happy.

At home—at home—there was the canker: it appeared no longer a home.

CHAPTER LXI.

MYSTERIOUS CHANGES.

Not many days had elapsed before I observed a sudden change in the conduct of Gallagher; not towards myself, or my mother, but in his manner towards Virginia.

It was the day after I had held the conversation with her, that I first noticed this. I noticed at the same time that her manner towards him was equally altered.

The somewhat frosty politeness that had hitherto been observed between them, appeared to have suddenly thawed, and their old genial friendship to become re-established on its former footing.

They now played, and sang, and laughed together, and read, and chattered nonsense, as they had been used to do in times past.

'Ah!' thought I, 'it is easy for him to forget; he is but a friend, and, of course, cannot have the feelings of a brother. Little matters it to him what may be her secret relations, or with whom. What need he care about her improprieties? She is good company, and her winning way has beguiled him from dwelling upon that suspicion, which he must have entertained as well as myself. He has either forgotten, forgiven, or else found some explanation of her conduct that seems to satisfy him. At all events, I appear to have lost his sympathy, while she has regained his confidence and friendship.'

I was at first astonished at this new phase in the relations of our family circle—afterwards puzzled by it.

I was too proud and piqued to ask Gallagher for an explanation; and, as he did not volunteer to give one, I was compelled to abide in ignorance.

I perceived that my mother also regarded this altered behaviour with surprise, and also with a feeling of a somewhat different kind—suspicion.

I could guess the reason of this. She fancied that they were growing too fond of each other—that, notwithstanding he had no fortune but his pay-roll, Virginia might fancy the dashing soldier for a husband.

Of course my mother, having already formed designs as to the disposal of her daughter, could not calmly contemplate such a destiny as this. It was natural enough, then, she should look with a jealous eye upon the gay confidence that had been established between them.

I should have been glad if I could have shared my mother's suspicions; happy if my sister had but fixed her affections there. My friend would have been welcome to call me brother. Fortuneless though he might be, I should have made no opposition to that alliance.

But it never entered my thoughts that there wasught between the two but the old rollicking friendship; and love acts not in that style. So far as Captain Gallagher was concerned, I could have given my mother assurance that would have quieted her fears.

And yet to a stranger they might have appeared as lovers—almost to any one except myself. They were together half the day and half the night: they rode together into the woods, and were sometimes absent for hours at a time. I perceived that my comrade began to care little for my company, and daily less. Stranger still, the chase no longer delighted him! As for duty, this he sadly neglected, and had not the 'lieutenant' been on the ground, I fear the 'corps' would have stood little chance of instruction.

As days passed on, I fancied that Gallagher began to relapse into a more sober method. He certainly seemed more thoughtful. This was when my sister was out of sight. It was not the air he had worn after our arrival—but very different.

It certainly resembled the bearing of a man in love. He would start on hearing my sister's voice from without—his ear was quick to catch every word from her, and his eyes expressed delight whenever she came into the room. Once or twice, I saw him gazing at her with an expression upon his countenance that betokened more than friendship.

My old suspicions began to return to me. After all, he *might* be in love with Virginia?

Certainly, she was fair enough to impress the heart even of this adamant soldier. Gallagher was no lady's man—had never been known to seek conquests over the sex—in fact, felt some awkwardness in their company. My sister seemed the only one before whom he could converse with fluency or freedom.

Notwithstanding, and after all, he *might* be in love? I should have been pleased to know it, could I only have insured him a reciprocity of his passion; but alas! that was not in my power.

I wondered whether she ever thought of him as a lover; but no—she could not—not if she was thinking of—

And yet her behaviour towards him was at times of such a character, that a stranger to her eccentricities would have fancied she loved him. Even I was mystified by her actions. She either had some feeling for him, beyond that of mere friendship, or made show of it. If he loved her, and she knew it, then her conduct was cruel in the extreme.

I indulged in such speculations, though only when I could not restrain myself from dwelling upon them. They were unpleasant; at times even painful.

I lived in a maze of doubt, puzzled and perplexed at what was passing around me; but at this time there turned up a new chapter in our family history, that, in point of mystery, eclipsed all the others. A piece of information reached me, that, if true, must sweep all these new-sprung theories out of my mind.

I learned that my sister was in love with *Arens Ringgold*—in other words, that she was 'listening to his addresses!'

CHAPTER LXVII.

MY INFORMANT.

This I had upon the authority of my faithful servant, Black Jake. Upon almost any other testimony, I should have been incredulous; but his was unimpeachable. Negro as he was, his perceptions were keen enough; while his earnestness proved that he believed what he said. He had reasons, and gave them.

I received the strange intelligence in this wise:

I was seated by the bathing-pond, alone, busied with a book, when I heard Jake's familiar voice pronouncing my name: 'Maser George.'

'Well, Jake?' I responded, without withdrawing my eyes from the page.

'Ise wanted all da mornin' to git you 'lone by yarsself; Ise want to hab a leetle bit ob a convassayhun, Maser George.'

The solemn tone, so unusual in the voice of Jake,

awoke my attention. Mechanically closing the book, I looked up in his face: it was solemn as his speech.

'A conversation with me, Jake?'

'Ye, masser—dat am if you ain't ingage?'

'Oh, by no means, Jake. Go on: let me hear what you have to say.'

'Poor fellow!' thought I—'he has his sorrows too. Some complaint about Viola. The wicked coquette is torturing him with jealousy; but what can I do? I cannot make her love him—no. "One man may lead a horse to the water, but forty can't make him drink." No; the little jade will act as she pleases, in spite of any remonstrance on my part. Well, Jake?'

'We, Masser George, I doant meself like to interfere in the 'fairs ob da family—daat I doant; but ye see, masser, things am a gwine all wrong—all wrong, by Golly!'

'In what respect?'

'Ah, masser, dat young lady—data young lady.'

Polite of Jake to call Viola a young lady.

'You think she is deceiving you?'

'More dan me, Masser George—more dan me.'

'What a wicked girl! But, perhaps, Jake, you only fancy these things? Have you had any proofs of her being unfaithful? Is there any one in particular who is now paying her attentions?'

'Yes, masser; berry partickler—nebber so partickler before—nebber.'

'A white man?'

'Gorramighty, Masser George!' exclaimed Jake, in a tone of surprise; 'you do talk kewrious: ob coorse it am a white man. No odder dan a white man dar shew 'tention to the young lady.'

I could not help smiling. Considering Jake's own complexion, he appeared to hold very exalted views of the unapproachableness of his charmer by those of her own race. I had once heard him boast that he was the 'only man ob colour dat could shine *thar*.' It was a white man, then, who was making his misery.

'Who is he, Jake?' I inquired.

'Ah, masser, he am dat ar villain debbil, Arums Ringgol!'

'What! Arens Ringgold?—he making love to Viola?'

'Viola! Gorramighty, Masser George!' exclaimed the black, staring till his eyes showed only the whites—'Viola! Gorramighty, I nebber say Viola!—nebber!'

'Of whom, then, are you speaking?'

'O masser, did I not say da young lady? dat am the young missa—Missa Vaginnny.'

'Oh! my sister you mean. Poh, poh! Jake. That is an old story. Arens Ringgold has been paying his addresses to my sister for many years; but with no chance of success. You needn't trouble yourself about that, my faithful friend; there is no danger of their getting married. She doesn't like him, Jake—I wonder who does or could—and even if she did, I would not permit it. But there's no fear, so you may make your mind easy on that score.'

My harangue seemed not to satisfy the black. He stood scratching his head, as if he had something more to communicate. I waited for him to speak.

'Scoose me, Masser George, for da freedom, but dar you make mighty big mistake. It am true dar war a time when Missa Vaginnny she no care for dat ar snake in da grass. But de times am change: him father—da ole thief—he am gone to the udda world; the young un he now rich—he big planter—the biggest on da ribber: ole missa she 'courage him come see Missa Vaginnny—'cause he rich, he good spec.'

'I know all that, Jake: my mother always wished it; but that signifies nothing—my sister is a little self-willed, and will be certain to have her own way. There is no fear of her giving her consent to marry Arens Ringgold.'

'Scoose me, Masser George, 'scoose me 'gain—I tell you, masser, you make mistake: she a'most consent now.'

'Why, what has put this notion into your head, my good fellow?'

'Viola, masser. Dat ere quadroon tell me all.'

'So, you are friends with Viola again?'

'Ye, Masser George, we good friend as ebber. Twar only my s'picion—I war wrong. She good gal—she true as de rifle. No more s'picion o' her, on de part ob Jake—no.'

'I am glad of that. But pray, what has she told you about Arens Ringgold and my sister?'

'She tell me all: she see somethin' ebbery day.'

'Every day! Why, it is many days since Arens Ringgold has visited here?'

'No, masser; dar you am mistake 'gain: Mass Arums he come to da 'house ebbery day—a'most ebbery day.'

'Nonsense; I never saw him here. I never heard of his having been, since my return from the fort.'

'But him hab been, for all dat, masser; I see 'im meself. He come when you gone out. He be here when wa goes a huntin'. I see um come yest'day, when you an' Mass Garger war away to the boluntien—dat he war eat'n.'

'You astonish me.'

'Dat's not all, masser. Viola she say dat Missa Vaginnny she 'have diffrent from what she used to: he talk love; she not angry no more; she listen to him talk. Oh, Masser George, Viola think she give her consent t' marry him: dat would be dreadful thing—berry, berry dreadful.'

'Jake,' said I, 'listen to me. You will stay by the house when I am absent. You will take note of every one who comes and goes; and whenever Arens Ringgold makes his appearance on a visit to the family, you will come for me as fast as horse can carry you.'

'Gollys! dat I will, Masser George: you nebber fear, I come fass enuff—like a streak ob de greased lightnin'.'

And with this promise, the black left me.

With all my disposition to be incredulous, I could not disregard the information thus imparted to me. Beyond doubt, there was truth in it. The black was too faithful to think of deceiving me, and too astute to be himself deceived. Viola had rare opportunities for observing all that passed within our family circle; and what motive could she have for inventing a tale like this?

Besides Jake had himself seen Ringgold on visits—of which I had never been informed. This confirmed the other—confirmed all.

What was I to make of it? Three who appear as lovers—the chief, Gallagher, Arens Ringgold! Has she grown wicked, abandoned, and is coquetting with all the world?

Can she have a thought of Ringgold? No—it is not possible. I could understand her having an affection for the soldier—a romantic passion for the brave and certainly handsome chief; but for Arens Ringgold—a squeaking, conceited snob, with nought but riches to recommend him—this appeared utterly improbable.

Of course, the influence was my mother's; but never before had I entertained a thought that Virginia would yield. If Viola spoke the truth, she had yielded, or was yielding.

'Ah, mother, mother! little knowest thou the fiend you would introduce to your home, and cherish as your child.'

Science and Arts.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS.

No. 225.

SATURDAY, APRIL 24, 1858.

PRICE 1½d.

S I R.

It is doubtful whether there be another monosyllable in the language which admits of such delicate distinctions as that most common one which heads this paper—Sir. Not the trembling 'No' of the bashful maiden, whose command of verbal inflection is so perfect that she makes it to fill the place of 'Yes,' could be more significant: not the emphatic 'There' of the dined alderman, who pushes his last plate an inch or two from his encroaching stomach with a satisfied sigh, and a comfortable and firm belief in his own mind that he has, in the highest and noblest sense, said Grace: not the 'Well?' of the rival conversationalist, interrogatively fitted in at the conclusion of your very best narration, as though the point were yet to come: not the facile 'Ah!' of the debt-hardened borrower, when he is reminded of the little account which, with the utmost delicacy, you have forbore to speak of until it has almost run clean out of sight for ever underneath the statute of limitations: not the 'Bah!' of the attorney, so different from the same expression in the mouth of the innocent wearers of his sheepskins, when you inadvertently let fall some moral axiom or some tender sentiment, forgetting in whose presence you stand: not even the 'Chur-r-r-ch, Chur-r-r-ch' of the Hyde Park democracy, when they flung, some months ago, that elongated monosyllable, with so great distinctness of meaning, at the titled Sabbath-breakers and miserable sinners of 'carriage-people' in the Ring; nothing equally brief had ever such variety of meaning as this 'Sir.'

Even in writing, and when it stands apart and unrelieved by 'My dear,' or 'Dear,' it has a certain unpleasant significance. It shews that the writer has no acquaintance, and far less friendship with the person he addresses; that, for certain, he does not know anything about him, and that, in all probability, he does not care. There is not only a stiffness and reserve, but an absolute antagonism in a 'Sir' of this sort. It is more than possible that it may be followed by, 'As the legal advisers of Messrs Harpy,' &c., and that the whole may be concluded—like an unprepossessing scorpion, whose worst has yet to come in the tail of it—by the signature of a legal firm. One has, in this case, to write back 'Gentlemen,' too, in return for it, which, it may be, is as tremendous a sacrifice of truth as of inclination. The editor of the *Moral Lever*—by no means the talented Irish novelist of that name—begins with the 'Sir' indignant, when he writes that he is in truth astonished at his once esteemed contributor requiring compensation in dross for that blessed privilege of elevating the masses

which has been afforded to him by the publication of his article; and the once esteemed contributor has made previous use of it, apologetically, in demanding modestly to know whether the *Lever* was accustomed to balance its accounts at the end of every six months or of a year.

This 'Sir' epistolary may be the herald of a compulsory marriage (when it emanates, for instance, from one of the big brothers of the three Miss Malonies, denominated, for certain reasons, 'Plague, Pestilence, and Famine'); of unexpected offspring of a doubtful paternity; of death, itself, even—provided, at least, that there is no property bequeathed to us, in which case we may be sure it would become 'My dear Sir,' or 'My very dear Sir,' in proportion to the sum; but it is never by any chance the harbinger of anything satisfactory, except perhaps in the extremely mitigated form of a receipt for the second payment of a disputed bill. 'Sir' never asks you to dinner, nor even pays you a compliment, except of the most artificial character, such as that of representing somebody as your most obedient and humble servant, who, if not an utter stranger, is a foe determined upon your ruin. 'Sir' is the dogged submission which the most savage hand is compelled to pay to the laws of civilisation, the transparent veil through which it strikes with undiminished power. The only social invitation which it ever heralds is that which belongs to the duello, the pressing summons to 'pistols for two in the sawpit,' or other unfrequented meeting-place; nor has it anything to do with love, except at the extreme fag-end of it, when it sometimes announces Cupid's death and the birth of mammon coincidently, in the notice of action for breach of promise of marriage. It is the sign that the chain of friendship is broken, and that the remaining life-links which connect us and the writer must needs be formed of a far baser metal. Indeed, the only sort of excellence which the 'Sir' epistolary possesses, is of a decidedly negative character; it does not, as far as we are aware, form part of the formula of a writ.

The 'Sir' colloquial, on the other hand, may be urbane and graceful enough; the tongue can express by inflection what it is not in the power of the pen through the same term to convey. A trivial and common-place remark of ours—for we do make such things on rare occasions, and at very long intervals—to a fellow-traveller in a railway-carriage, has been sometimes replied to by this little word, in a manner (before our-marriage, that is) which has set our heart beating, and our cheeks aflame; our youth and beauty were remarkable at one period, and we have

now and then been forcibly recalled to a sense of them by the silvery softness of this monosyllable 'Sir,' expressed with all the admiring modesty of sweet seventeen. What a totally different significance has the very same word in the mouth of our friend, Bullion of the Exchange!—Bullion, who sits opposite to us in church, and annoys us by his condescension and assumption of supercelestial dignity—Bullion, whom one wonders the clergyman does not rebuke from the pulpit, saying: 'Miserable sinner, behave yourself as such,' instead of giving a piece of his mind to the charity-boy asleep in the aisle, who does not want it. You should hear Sir 'Sir' in a railway-carriage. Ask him what's o'clock, offer him a newspaper, tread upon his gaiter toe, (bore him, be polite to him, or insult him, the result will be all the same,) and if he does not happen to know that you also are a very rich man indeed, what a terrible monosyllable he will make of it! 'Do you know to whom you are addressing yourself?' 'Confound your impertinence!' and 'Who in the name of all first-class passengers may you be?' are all implied in his enunciation of 'Sir!'

Ah, this word is absolute and of the greatest consequence, like any rich bachelor uncle; like him, too, married to another, it loses all importance, and becomes of quite fifth-rate account. The snarling 'Yesir,' the mandacious 'Comingsir,' of the hotel waiter, express only respect with the chill off, and very little even of that. The 'By-your-leave-sir' of the luggage-porter, so far from being a homage to your rank and character, is the prologue, and sometimes even the epilogue, to your being run over by a east-iron truck. The 'What, Sir!' 'Me, Sir?' of offended dignity, instead of being relieved and palliated by this respectful monosyllable, is sharpened and rendered all the more ferocious by it; while the phrase 'You, Sir,' possesses all the sombre significance of the ancient 'Sirrah,' and is commonest in the mouth of the angry pedagogue, with cane in hand. Lastly, what a world of meaning, deep and wide, is conveyed by the 'Sir' oratorical! While it appears to refer solely to some august personage in a wig and other superfluities, who may happen for the nonce to be the Speaker of the House of Commons, it in reality typifies the whole civilized world, and sometimes (when an honourable member gets impassioned) even the starry firmament in addition. Heaven itself is called to witness to the shameful treatment of the independent electors of Ballyblaney, to their having been scratched under the harrow of the Baron, by the aid of this unconscionable 'Sirrh-rh-rh.' By 'Sir-r-r,' too, a treacherous and perfidious government is warned that, though it may not be placed in an ignominious minority that night, a day will come when the vials of wrath will be poured out upon it, and when not a place above the value of two thousand a year will be left among its dissipated atoms; and, by the same word, a factious opposition is solemnly advised, as by the still small voice of conscience itself, to cease to assist by their unscrupulous and obstructive policy, the foreign invader and the domestic anarchist. By this, too, the country is informed, amidst tumultuous cheering, that its state of prosperity is unexampled, and its present height of social happiness the greatest which it has ever yet attained, and, by this, it is adjured to hesitate, amidst tumultuous cheering likewise, lest the small end of the wedge be introduced, and the flag which for a thousand years has braved the battle and the breeze be hoisted half-mast high, because England's glory has set. It is indeed the unalterable opinion of the

writer of this paper that, should this term of 'Sir' be eliminated from our language, the destruction of the constitution would follow as a matter of course.

THE PURGATORY OF PRISONERS.

THERE is a class of men in the world the fundamental doctrine of whose gloomy creed appears to be disbelief in social progress. The ray of new light in which more cheerful temperaments are rejoicing, serves for them only to deepen the shadow. Their vocation is to state and re-state each social problem, and to ignore or denounce all attempts at its solution. When the philanthropist talks of decrease in the amount of evil, they suspect mere variety of development: the change, they say, is but in kind, the degree is as high as heretofore. Let an enterprise be ever so noble in its aim, no throb of sanguine sympathy prevents them from coolly calculating the retarding force which will, they maintain, in a given time, check its impetus, and diminish its results. Talk to them of preventive or reformatory measures, they answer you with a shrug and a sigh. 'Once bad, always bad' is a dogma of minds of this desponding cast. Yet, since facts are stubborn things, we should like to put into the hands of such men certain statistics on Irish convict-prisons at this moment before us. We think they would find it difficult to deny that these report a very remarkable amount of success in solving one of the vital questions the Sphinx of our times keeps putting to society, and which society must reply to properly, or was beside it!—the question, namely, What is to be done with our criminal population? Or, rather, since in theory it is universally allowed that criminals are to be deterred by punishment, and reformed by discipline, the Sphinx's present question may be more correctly stated thus: 'In what manner do you propose to set about deterring and reforming?'

To this the papers before us return a most satisfactory answer. They tell us what has actually been accomplished by the system pursued in Ireland for the last year and a half—no very lengthened period, it is true, yet amply sufficient to prove the soundness of the principle on which the system is based, and the excellence of the machinery by which it is worked. Its distinctive feature consists of its intermediate prisons—'places of penitential purification,' to use the language of one of their advocates; 'Stations between the prisons and the public,' according to the metaphor of another—in which, the penal stage past, the prisoner becomes subjected not only to additional reformatory influences, but to actual probation; and this, it is obvious, must act favourably both on the man himself, and on the public feeling concerning him, by fitting him to return to the duties of the free, and affording evidence of his power to perform them, by restoring his self-respect, and giving him a claim to the respect of others. We now proceed to give an account of the present plan of Irish convict-management, contrasting it, first of all, with that which it happily replaces.

'It's always the darkest the hour before day,' prettily says the Irish proverb. 'When things are at the worst, they mend,' according to our more prosaic way of stating the same truth.

In 1853, Captain Crofton was authorized to inquire into the state of Irish convict-prisons, and here to his account of them, given in a year after: 'It was as deplorable as it is possible to conceive—the prisoners were morally and physically prostrate. There was a want of the element of hope in them, of education, and of everything else one would wish to find. The prisons were overcrowded in a very great degree.' After bearing this, we are prepared to find that Irish prisoners were an intolerable nuisance to the colonies.

From Western Australia, the governor writes to deprecate their being sent out with tickets of licence, suggesting—with some prevision of the present system—'twelve months' rigid control to train them into fitness for relative liberty.' The same gentleman goes on to remark, as 'a noticeable feature in the idiosyncrasy of the Irish prisoners, that they evince a singular inaptitude to comprehend the nature of moral agencies, or to be affected by them.' Again, he speaks of six hundred of these men as 'lost to every impulse of independent thought or action, debilitated, diseased, indolent, and noticeably ill-trained.' Such, then, was the raw material with which the new system has had to deal, such was the desperate case which called for prompt and radical remedy.

The Irish Prisons Act of Parliament having passed August 7, 1854, the first step taken was to do away with the overcrowding of the jails. The best conducted prisoners were, according to a suggestion of the lord-lieutenant, Lord St Germaine, recommended for discharge; a hundred warders were sent away; every schoolmaster save one dismissed; and many of the superior officers superannuated; and the prisons reduced to comparative order. 'We then,' continues Captain Crofton, 'followed out the English system with regard to public works, establishing gratuities, to give convicts the element of hope, and to induce them to conduct themselves steadily.'

The element of hope! In these words lie the strength of the whole beneficent scheme, and the secret of its success. There are certain impossibilities which people either never attempted, or have long left off attempting. Armaments, Herodotus tells us, were once fitted out against the south wind; but, taught in that case by experience, people gave up such expeditions pretty soon. Plants are not expected to grow gorgeous-hued deprived of sunlight, nor animals to qualify for the prize-show on other than a nutritive diet; but characters have been expected to soften under heart-hardening treatment, to grow moral through demoralising association, to strive hard with no definite end in view, to improve without the soul's vital breath—without the element of hope. There were better prospects of beating back the south wind! Now, then, with this bright ray of light thrown on the subject, this element of hope conceded henceforth to convicts—hope of more than mere liberation, mere freedom to fall again into crime—we pass over the next step taken by the prison reformers, the separation of juvenile from adult offenders, because this is a measure universally adopted in theory, at all events, and not distinctive of the Irish system.

The present career of the Irish convict may be said to consist of three stages, of which the first may be characterised as specially penal; the second, reformatory; the third, probational. A convict on coming under the control of the board goes first to the cellular jail called Mountjoy. Here he is placed day and night in strict separation from his fellows; 'except in chapel, the exercise-ground, and the school-room,' where, of course, all conversation is prohibited. In this almost absolute seclusion, alone with bitter and unholy memories, full of regret or remorse for his former career, we can well believe that the chaplain's ministrations are 'all-important;' and for a time this discipline approves itself as 'most wholesome,' drawing as it does 'a broad line of demarcation between the past and the future, subduing and almost invariably leading to a change of sentiment.' But as Mr Cooney, one of the Mountjoy chaplains, wisely remarks: 'It is vain to expect that religion can exercise this absorbing influence for a very long period. These poor men are not called by God to a contemplative life, and hence their minds soon require to be relieved by their occupations.' Mr Cooney further recommends that, after the lapse of two or three months, these

occupations should be such as would employ the convict busily and pleasantly.

Supposing the prisoner to have behaved well, this stage ends at the end of nine months. From the very first, the convict's 'fate is placed in his own hands,' and thus a fresh start in life, so to speak, is afforded him. Inside these walls, at least, he may begin well. He is made to feel that he has prospects dependent upon his present conduct, and not irremediably clogged with the burden of his past.

His next move is to Spike Island, a fortified station in the Cove of Cork. Here things begin to brighten—'though hard at work all day at the repair and enlargement of the military works, and shut up at night in the cellular divisions of a barrack,' he may exchange words with his comrades, and then his is now outdoor work—he sees the sky, the flight of the clouds, the burst of sunshine, the play of the waves around his ocean-prison, and though perhaps it were too much to say of one whose taste for the beautiful has been so little cultured, that

The common air, the earth, the skies
To him are opening Paradise;

yet, after nine months' experience of the gloomy cell, the fresh free breeze and the associated labour must necessarily have an exhilarating influence on body and mind. The man has gained a step; his self-respect revives; and that blessed germ of hope he took with him into the Mountjoy cell, puts forth green shoots now, and will blossom by and by. At Spike Island he is employed according to his abilities, in outdoor work. If his be an indoor trade, he is sent to another prison, Philipstown, forty miles from Dublin. In both places alike, his privileges and means of improvement are extended. 'The schoolmaster becomes a lecturer, also adapting his subjects to the wants, capacities, and tastes of his hearers,' turning their attention to the colonies, the goal of their general ambition, and enforcing moral truths in a popular manner. The prisoner has also now gained the power of earning by industry and good conduct certain gratuities, small enough at first, but which increase with continued good conduct; while, on the other hand, men that misconduct themselves forfeit all claim to gratuities.

'If change of station were possible at every step of the convict's progress,' remarks Mr Hill, in his most interesting paper on this subject, read at the late Birmingham meeting for the promotion of social science—'some advantages would be gained; but this is impossible. The board has therefore devised subsidiary stages and classes.' The prisoner entering always in the third, may be promoted to the second at periods of two, three, or four months, according as his conduct has been exemplary, very good, good, or indifferent. 'With regard to prisoners in the second class, the minimum of time before they reach the first is six months, the maximum is undefined.' (Always we see the prisoner's fate is in his own hands.)

Once in the first class, blameless behaviour for a year qualifies for the last stage—transference to the Forts, to Lusk, or to Smithfield, according to circumstances. The artisan goes to Smithfield, the agricultural labourer to Lusk, the mechanic to Forts Camden and Carlisle in Cork Harbour. In each of these, 'the numbers are restricted to one hundred, in order that individualisation may be brought to bear upon the inmates, and a measure of voluntary action permitted to all.' The prisoner has now arrived at the intermediate or probationary stage, which, as we have before stated, is the distinctive feature of the Irish system. Here 'nearly all connection with prison-life is suspended; the dress is that of the ordinary workman; the hair is free to grow; the man is fast shaking off his degrading antecedents. 'New objects, new aspirations, new desires, are to be cultivated.' The

divine model of forgiveness being kept in view, and reverently followed, none of his former offences are any more remembered against him. He is treated with respect; his honour is appealed to and confided in, and an *esprit de corps* enlisted on the side of the institution; he learns to care for its honour too. At the same time, here, where so much is given, much also is required. 'The prisoner is subject to very strict supervision, and holds his post under arduous responsibility.' Idleness infallibly leads to a return to Spike Island, and is indeed the most frequent cause of such a retrograde step. 'The man who proves himself unworthy of partially restrained liberty, is considered unfit for the greater liberty of ticket of licence, still more so for unconditional discharge.' In short, this stage is eminently a probationary one. Men have scope here for the exercise of self-denial, being now, in addition to their gratuities, entitled to a small portion of their own earnings, out of which they may draw sixpence weekly, to be spent as they will, with the one merciful exception of all intoxicating drinks whatever. Sometimes the prisoner goes on adding this weekly sixpence to his little fund, not only increasing it, but strengthening himself in the grand attainment—for which, by the way, we sadly want a name—of *going without*. Or should he invest the sum judiciously, it is still well. If not discreetly spent, no word of disapproval is spoken, else the man might feel his right of free expenditure a mere nominal thing. However, in a case of this kind there is still something to be done by a wise and loving-hearted director. On one occasion, we are told that Captain Crofton, having found that a prisoner's sixpences had been for some months wasted on tobacco, skilfully went to work in the following manner. He began by asking the man what first brought him into trouble.

'Drink,' was the reply.

'Are you not afraid of again being decoyed into the habit of drinking when you leave this place?'

'Not at all. I have had no drink for years, and I do very well without it.'

'But you were for years without tobacco; and although you suffered at first, you discovered, after a time, that tobacco was not essential to your comfort; yet the moment you are allowed to purchase it, you do so. How can you be sure that, as you have not been able to resist tobacco, you will be able to resist drink when you have the power of obtaining it?'

The man thought these words over, the tobacco entries gradually but steadily decreased; in six weeks, the victory was won!

Again, the honesty of intermediate men is tried as well as their self-denial. They are sent out on errands, trusted with money by the authorities, and, what is more remarkable, implicitly trusted by their comrades. We have two pleasant anecdotes given us in illustration of this. A certain Patrick O'Hagan goes out one day with about fifteen shillings in his pocket, and all manner of small commissions to execute for his neighbours. When he returned, delivered his parcels, and counted up his money, he found to his dismay that a sixpence was wanting. But no one suspected him; his fellow-convicts were quite sure that some mistake had been made, or the money lost—nothing worse. The following morning, another prisoner, in sweeping the yard, found the missing coin. On another occasion, a man at the Cork Forts mislaid the considerable sum of four shillings. He, too, was totally without suspicion of those around them; he firmly believed the money lost, not taken. The event proved—we are not told how—that he had been quite right in this charitable conclusion.

At these intermediate prisons, mental culture is carefully attended to. At Smithfield, the prisoners are fortunate in possessing for their schoolmaster and

lecturer one of those remarkable men, endowed with a natural ascendancy over their fellows, who seem raised up at the beginning of every reformatory measure to give it the impetus it needs to be set fairly in motion. Could a succession of such men be insured, what results might not be expected! This indefatigable Mr Organ, friend, teacher—guardian angel, one might say—'possesses the gift of captivating the hearts while cultivating the minds of his pupils; nor does his kind tutelage come to an end on their enlargement. So far as it is possible, he watches over them, even when they are far away. His successful labours have attracted the attention of the lord-lieutenant, who not seldom joins the audience at the evening lectures, and takes part in questioning the men.' The favourite subject of inquiry among the pupils is, we find, emigration; but elementary science and the principles of political economy are practically taught and applied. But special mental culture by no means occupies an undue portion of the intermediate man's day. Its routine is as follows: Preparation for day's work and prayer, 1½ hours; meals and exercise, 2½ hours; lectures and study, 3½ hours; labour, 9½ hours; sleep, 8 hours.

Turning to the other establishments of the kind, we meet with the same system of management. Here, however, the exemplary convicts are located by fifties in 'corrugated iron huts, lined with wood,' experience proving these to be very comfortable habitations. Obviously, however, they lack the security of the permanent prison, and are therefore only fit for men amenable to moral restraint. But for intermediate men, with 'their fate in their own hands,' and a character to support, it would be the worst policy in the world to desert. 'Accordingly, convicts with two years of their sentence still to run, are working unrestrainedly at Lusk, draining the common, leveling, building, &c.' And out of the total of nearly 900 prisoners, under the surveillance of one superintendent, one schoolmaster, and six warders to each hundred, only one attempt to escape has been made during the eighteen months for which the system has been at work.

We come now to its results upon the public mind. Great difference of opinion, we are all aware, prevails in England respecting the success of the ticket-of-leave system; but every one is agreed that the main difficulty in the way of its working is that of obtaining employment for the ticket-holders. The many feel that the whole scheme is but 'an engine for turning felons loose to prey on society.' Accordingly, society shudders. As the *Times* once remarked: 'The position of ticket-of-leave men is most pitiable, nor, unless some means exist of obtaining back for them that which they have lost—namely, character—is there much chance that it will ever receive any sensible amelioration.' As things are, how can we wonder at society, which instinctively feels that the prison test of conduct, still more of character, is wholly unsatisfactory and inadequate, and that whatever chaplain and prison-officers may think of the prisoner, the chances are that he will very probably return to his old ways as soon as free agency is restored. Colonel Jebb gives utterance to a very prevalent popular impression when he says: 'I wish it were possible to give greater weight to the opinions of the chaplains as to the religious state of the men.' On the other hand, if society be naturally shy of the ticket-of-leave man, how natural that he should again fall into offences against society! He has had no opportunity of testing his own principles or regaining his own respect, and his nature is embittered by feeling himself an object of suspicion and contempt to those around him. Under these circumstances, it is matter of surprise that the percentage of recommitment for fresh offences is not greater than we find it to be.

Now, in Ireland, we have it upon the authority of Mr Hill that the demand for the services of discharged prisoners exceeds the supply, and that the average of wages which these men can command is at least ten shillings a week. So adequate does the public consider the 'filtering process' of the intermediate establishments.

The next question that suggests itself is this: 'Have the men thus welcomed into employment proved themselves worthy of it?' This question is answered by the fact, that though slight irregularities are always noticed, and 'the terms of the licence most strictly enforced,' revocations of these licences amount to little more than 3 per cent.

With reference to the five hundred men absolutely discharged, it is, of course, impossible to speak with equal precision. We rejoice to be told that 'large numbers of these still continue in correspondence with the authorities,' and that 'scores of these letters are to be seen at the institutions;' but special supervision by the police being impossible in their case, there is no other than negative evidence to be had respecting them. The chairman, however, considers that recommitments from among this class do not exceed 10 per cent.

So much for the highest success—the reformation of the criminal; and now for the economical side of the question. 'The statistics of the expense,' says the Rev. Orby Shipley, one of its most fervent advocates, 'will be as palatable to the rate-payer, as the moral results to the Christian. . . . The agricultural colonies are self-supporting; the trade departments can be made so.' One of the wise economics adopted is the appointing tradesmen as warders in the latter, and qualified foremen of the works in the former case. It is found that, under a proper system of discipline, the labour of a hundred men, no longer given grudgingly and of necessity, but hopeful energetic labour, with eventual liberty for its reward, is amply sufficient to pay all their needful expenses, including more liberal salaries to a superior class of prison-officers. The return given by Captain Crofton in his Annual Report, actually proves that a large balance in favour of the public may be expected from the labour of intermediate prisoners applied to public works, such as 'harbours of refuge and coast-defences,' such works, in short, as Adam Smith pronounces it the duty of a sovereign to 'erect and maintain'—works 'which, though they may be in the highest degree advantageous to a great society, are, however, of such a nature as that the profit could never repay the expense, and which it cannot therefore be expected that any individual should erect and maintain.' Such works as these will be greatly facilitated by the recent adoption of iron huts, which, inexpensive in themselves, preclude the heavy cost of permanent prison-building, and render it an easy matter to transfer selected convicts from station to station, according as their labour is required.

We have left ourselves but little space to glance at prisons and refuges for female convicts. The system pursued in these is the same in principle, but there are necessarily peculiar difficulties in its way. The fragile texture of a woman's character is more seriously warped and ravelled by crime than that of man is found to be. Her excitable, irritable temperament renders her more incapable of passing through the penal stage without danger to mental and physical health. Again, she has not the outdoor work so favourable to the strength and spirits of the men, so pleasantly and cheerfully diversifying their reformational period. Refuges must, in the case of women, supply the only 'filtering process' possible. We rejoice that such are increasing in Ireland, and that the results of three now in operation are highly satisfactory. It is but justice to say that the devotion of

their Roman Catholic sisters to this blessed mission may well provoke Protestant women to an equal measure of 'love and good works.'

There remains one dark fact to consider and provide for. While it is assumed that from seventy to seventy-five convicted prisoners may be profitably subjected to special treatment in intermediate prisons, there still remains a minority of—humanly speaking—the hopelessly irreclaimable. How little responsible these may be, we cannot know; how dangerous they are, we see, and have to provide against. These men, we are told, are easily distinguishable at an early portion of their prison career. Virtually lunatics, it is proposed that they be treated as such, 'located in special prisons, guarded by special officers, and placed at special labour.' Until lately, this class, removed from the parent country, made Norfolk Island in very truth a hell upon earth. Captain Crofton believes that the sending such men abroad never has succeeded, and never will, either as a reformatory or deterrent measure; and another high authority, M. Bérenger, has arrived at the same conclusion. One of the most important features of the new act is its authorisation of exceptional methods to be carried on at home in these exceptional cases. The length of a prisoner's sentence is no longer exclusively decided by the offence he committed outside the prison-walls, but by his conduct within them. The executive possesses 'powers of life-long incarceration for the life-long incorrigible, life-long supervision for the life-long unimpressible.' Of these, however, it is confidently and reasonably hoped that improved education and improved prison-training may materially diminish the number.

We sum up the whole system in Mr Hill's emphatic, hopeful, yet solemn reply to the long vexed question—What shall we do with our convicts? 'Keep your prisoners under sound and enlightened discipline until they are reformed—keep them, for your own sake, and for theirs. The vast majority of all who enter your prisons as criminals can be sent back into the world, after no unreasonable term of probation, honest men and useful citizens. Let the small minority remain; and if death arrive before reformation, let them remain for life.'

A 'RAREY' SHOW.

WHEN glorious old Homer wanted an epithet with which to round off his description of a Hector or a Diomedes, he called the hero a 'horse-conqueror,' a 'tamer of steeds'—a very different association of ideas, it is true, from that of our modern hippodromos, or 'horse-breaker.' Setting aside the mere question of bone and muscle, about which no doubt much poetic licence is taken by bards in all ages, we must admit some differences as to the outer man. The glittering helmet with nodding plumes of the noble Phrygian, Priam's best and bravest son, must give place to an old battered felt, or wide-awake; the brazen plates and scales, to a greasy cast-off hunting-coat; while the seedy and blotchy 'tops' finishing off no less seedy and blotchy 'shorts,' must stand instead of the graceful yet muscular limbs and picturesque greaves of the well-booted Grecians.

Still, with all his faults, the horse-breaker is, in the eyes of our youth, a heroic man. If we have seen a great, long-legged, slapping colt gambolling at liberty for four long years in the paternal pastures, since we first patted his nice little velvety nose as a new-born foal in the paternal paddock; if we have marked his growth, and trembled with the undulations of the soil as he has rushed past us, snorting indignation and contempt at our puny attempts to pen him up in a corner with no better force than half-a-dozen school-boys like ourselves;

if this has been our previous experience in reference to 'the colt,' it cannot be but that the man who undertakes to bring this wild *Bucephalus* under the dominion of the saddle or collar, is, in our eyes, a great man, and no mistake. We know that there is danger to be encountered, exaggerated a thousand-fold by our boyish feelings and inexperience, and we feel that this illiterate, drunken old fellow can do something which any number of us would be quite unable to accomplish. Thus we exalt the crazy creature into the dignity of a hero; proving thereby that it is a fact intimately connected with the heroic side of man's character and history, that he has been able to subdue and render amenable to his purposes, in peace or war, this magnificent quadruped. A mature judgment would correct much of this impression, so far as it regards the personal danger attending the process; but the inveterately drunken habits of modern horse-breakers really do place their lives at times in imminent peril. There are also accidents to which even sober hippodomoi would be exposed under the present injudicious management—of which more anon—and I have myself known three generations of them in the same family 'killed off' in succession by broken necks, after fractures, bruises, and contusions innumerable had been surmounted. I suppose the experience of most persons who have lived in the country and been much 'about horses,' is somewhat similar.

It is certainly exciting to see a fine colt, such as I have introduced above, strapped up to the 'german rider' (or dumb jockey), and trotting proudly round and round in the ring. Still more so is it if, after some days' 'working him over the ground,' the old crippled horse-breaker, probably after an encouraging 'bit of lunch' in the servants' hall, thinks he will 'just see and back him a bit this afternoon.'

Up he gets on his, in our eyes, perilous eminence—Cardinal Wolsey himself was not in greater danger, we being the judges—and, after settling himself for some time, and giving little jerks of his body to let the horse know that he is *there*, the stalwart attendants lead him on a little, and then the word is given to 'let him go!'

Sometimes this all ends peaceably enough, and we boys are rather disappointed than otherwise at seeing that no serious objection is made by the colt to his new burden; but it will happen that the old dingy spurs, which look as if they were rusted into the boots, have not been laid aside for the first 'backing;' and as the 'german rider' wears no spurs, this particular arrangement is quite unknown to the pupil. If, in such circumstances, a touch of the cold steel should be inadvertently given, there may be quite enough of trouble in the wind to satisfy even a school-boy's taste for the exciting and terrible. The surprised animal will then snort and plunge in a fearful manner, and use every effort to get rid of his tormentor; in this he sometimes succeeds, to the damage of life or limb; but, more frequently, and if the ale has not been too strong, the tough muscles of the rider, long accustomed to exert their utmost tenacity in a particular direction, enable him to literally 'ride out the storm.' A struggle takes place like what we read of as occurring in the South American pampas, and goes on until the nobler animal gives way from sheer exhaustion, and exhibits a practical illustration of the old saying, 'what can't be cured, must be endured;' and although it may be months before he can be depended on, yet he does in time submit, and put his shoulder to the collar, or yield his back to the saddle, in a wonderful manner; as shewing that, in the long-run, intellect must gain the day against mere brute force. Still the 'palm is not without dust.' While the struggle goes on, the old fellow now lurches to one side, now rolls to the

other; now he seems as if he must go off over the head of the steed, and again as if he would capsize in the opposite direction; but, as I have said, the horse's struggles exhaust only himself, and leave the victory in the hands of all-subduing man.

As regards the general practice, it is quite deplorable to think of the needless barbarity with which this breaking-in process is conducted. The poor colt is—without being familiarised even for a day to a great bar of cold iron thrust across his mouth—sharply tied up to the 'rider,' so as to excoerate his lips and gums, the result of which excoeriation is a callosity quite fatal to our hopes of a good mouth, and rendering all the nuisances connected with the curb-chain indispensable; then he is incommoded with a crupper, excoeriating another part; and then he is forced to go forward against opposing and painful pressures.

With a little gentle preparatory training, while young, all this could be greatly ameliorated, as I have often proved by experience. By accustoming the young animal to be handled, bitten, saddled, and led about, and avoiding high-feeding at the time of actual backing, I am satisfied that nearly all of this infliction of needless suffering can be done away with; not to speak of the saving of wear and tear of the animals themselves.

I shall never forget the regret and indignation I felt at seeing the stupid mismanagement of an old groom who was intrusted, many years ago, by a friend of mine, with the training of some very fine and valuable colts of his own breeding. They were, as I say, strikingly fine, promising, and high-bred animals, four years old, and full of high-feeding and courage. It was only to be expected that they should revolt most violently against the discipline of the bridle and saddle; and I saw plainly enough that the severe and constant 'riking' to which they were subjected each day, in order to tame them down to the point when they could be safely handled and mounted, and the long exercise on hard ground afterwards, must, of necessity, founder them in great measure, before they had 'come in' for the master's use. I suggested, with all possible urgency, that if oats were altogether withheld for the time, and only a moderate share even of hay allowed them, all this unmerciful pounding of their young limbs upon hard ground—for at that time the green fields were even worse for them than the high road itself—might be avoided. I was, however, met by derision, and told, in good set-terms, that I knew nothing about the matter; that you never 'can be sure of a horse, unless you bring him in in his full spirit,' &c. The result was, that the best and most valuable hunters of that 'lot' were prematurely 'cast off,' because they had no 'fore-legs' at seven years of age. At that very period I adopted what was derisively called the 'starving system,' with two young animals of about the same sort, but less valuable on some accounts; and with perfect success. One of them I sold while young; the other I used as a 'ride-and-drive' horse for eleven years, and gave him to a friend, at fourteen or fifteen, as sound on his legs as ever, after a life of real, although fair, work on hard roads, both in saddle and harness.

A vast amount of useless wear and tear might, I am fully convinced, be thus saved, and most young horses would come to their work unfounded, by such a gentle and judicious system of management as I have suggested—but chiefly by low-feeding at the critical period. There are, however, vicious brutes—some born such, and some rendered dangerous by improper treatment—the breaking-in of which has always been a matter of infinite trouble and difficulty. A friend of mine once bought, for a mere song, a high-bred and beautiful colt which it was found impossible to bridle. He paid the money, asked for the key

of the stable, put it in his pocket, and rode home; taking care that all food, except some dirty litter, was removed. Thus twenty-four hours were suffered to elapse, and then he came again, provided himself with a handful of oats in a sieve, entered the stable, and while the famished animal was greedily feeding on the corn, he slipped the bridle into his mouth and over his ears, and led him away in triumph. I need hardly observe that the bridle was left on for a time, and by the adoption of moderate means and low-feeding, this 'vicious' horse was soon tamed, and subsequently sold for a high price.

Every one has heard of Sullivan the Irish 'Whisperer,' who stood alone in his day in the possession of some secret, known only to himself and the subjects on which he operated, and by which he most undoubtedly succeeded in taming, in a few hours, the most refractory horses submitted to the trial. A graphic instance of this is given in Mr Youatt's book, *The Horse*, on the authority of an eminent veterinary surgeon of Dublin, who witnessed the scene.

The subject of this experiment was a celebrated racer called King Pepin. This horse was sometimes dangerously vicious; and on one particular day, when he was engaged to run on the 'Curragh,' he would let no one into the stable to put a bridle upon him. A great lumbering country fellow volunteered to do this, but his enraged majesty seized him by the back with his teeth, and shook him like a terrier shaking a rat. Fortunately, like all his countrymen who have it in their power to do so, this daring individual had put on as many coats as he could well carry; so that while the king thought, no doubt, he was paying off the man, he got only a mouthful of coarse grey frieze before reaching the actual skin, of which latter he scarcely had more than a superficial hold with his teeth; and Faddy, in addition to being laughed at, got off with a severe pinch and a sad damage to his holiday toggery.

As Sullivan was known to be on the spot, he was sought out, and at his own request, shut up with the indignant monarch; in about an hour he appeared on the open course, followed about by King Pepin, as a dog follows his master; and the horse lay down, got up again, and suffered himself to be handled all over at the bidding of this rude, ignorant rustic (for such he was), to the infinite astonishment of a crowd of bystanders.

Of course, the 'Whisperer' could have made a fortune if he had chosen; but he contented himself with a moderate scale of earnings, just sufficient to enable him to enjoy his favourite pastime of meeting with the Suhallow hounds. The curious fact connected with him is, that he could not communicate his secret even to his son; after his death, the latter often attempted to exercise his father's calling, but the endeavour was a complete failure.

Thus the matter of horse-conquering remained for many years, no one appearing to have caught old Sullivan's secret, or invented a method for himself. But, within the last few months, the case has been otherwise; and an American hippodamus, or horse-tamer, has fully equalled, if not eclipsed, the renown of the sorcerer from far Suhallow.

It would seem that this now celebrated Columbian, whose name is Rarey, has been completely successful in taming every sort of vicious and dangerous horse on which he has exercised his skill here in England; while more recently, in France, he has outdone even himself. It would seem that a horse belonging to the imperial *baras*, or breeding-grounds, had been so mischievous that its destruction had been at last determined upon. This impracticable beast was brought to the Parisian Tatterall's, blindfolded, and encumbered in all possible ways to prevent mischief: Mr Rarey was cloistered with him for a few hours,

and then appeared riding on his back, in the midst of the astonished spectators! The horse was perfectly docile and gentle, although previously he had bitten the legs of all who mounted him. The sight of a whip put him in a fury, but now he allowed one to be cracked over his ears, and a drum to be beaten on his back, without exhibiting the least sign of impatience or apprehension. This extraordinary spectacle I have ventured to introduce to my readers as a 'Rarey Show;' and I am persuaded that, while they pardon a very bad pun, they will agree with me in thinking that such an exhibition as this beats the old 'Raree Show' on Lord-mayor's Day all to shivers.

As it now appears that this wonderful gift is not a mere accident attendant on some peculiarity in an individual man, and incommunicable to others, as in the case of the ancient 'Whisperer,' but a science, based upon a given principle, and capable of explanation upon a reference to known laws of the natural world, it seems to deserve a place in the records of scientific discovery.

I observe by the advertising sheet of the *Times*, that an Englishman, calling himself the 'Horse-tamer,' offers to shew his method to a certain number of subscribers at a guinea each; while the *Boston Journal* (U. S.) professes to disclose gratuitously Mr Rarey's secret, which consists, it tells us, of the use of certain rubs and drugs administered in the following manner: 'Procure some horse-castor, and grate it fine; also get some oil of Rhodium and oil of cumin, and keep the three separate in air-tight bottles. Rub a little oil of cumin upon your hand, and approach the horse in the field, on the windward side, so that he can smell the cumin. The horse will let you come up to him then without any trouble. Immediately rub your hand gently on the horse's nose, getting a little of the oil on it. You can lead him anywhere. Give him a little of the castor on a piece of loaf-sugar or potato. Put eight drops of oil of Rhodium into a lady's silver thimble. Take the thimble between the thumb and middle finger, stopping the mouth of the thimble to prevent the oil from running out whilst you open the mouth of the horse. As soon as you have opened the horse's mouth, tip the thimble over upon his tongue, and he is your servant. He will follow you like a pet dog. He is now your pupil and your friend. You can teach him anything, only be kind to him, be gentle. Love him and he will love you. Feed him before you do yourself. Shelter him well; groom him yourself, keep him clean, and at night always give him a good bed at least a foot deep.'

The horse-castor mentioned here is an excrescence growing on the fore-legs, and frequently the hind-legs; of all horses: it has a strong ammoniac odour, and is attractive to other animals as well as the horse. The oil of Rhodium exercises a subduing influence over all animals; and for the oil of cumin the horse has an instinctive passion.

Speaking as one who has seen much of what is called 'horseflesh,' and studied what may be termed the psychology of the animal creation with some attention, I confess I am lost in astonishment at what is now brought to light in reference to this horse-taming business. The horse is far from being endowed with much sagacity in a general way. But, admitting that a normal horse can, with very laborious training, be taught those tricks which are shewn in the 'horse-ridings' of our country, it is still a wondrous thing to me to think of old and established *vicious habits*—the habitual temper and disposition of years—removed by a few hours, more or less, of secret conference with another being of a totally different species; with whom there can be no direct interchange of thought or language—even in the low and limited sense in which this is possible as between the ordinary horse

and his habitual trainer—and whom he must look upon, in the first instance, as one of those very creatures whom, for years, perhaps, he has been setting at defiance, resisting successfully in their attempts to get the better of him, and regarding with feelings of mingled contempt and aversion. All this does, I confess, fill me with a degree of astonishment which I find it impossible to express in words; and which, I venture to say, will be shared in by others, just in proportion as they may have been close and attentive students of natural history, and patient observers of the habits, and, if one may so call them, the moral feelings of the lower animals. An entire reformation of this sort brought about without violence or any bewildering effect upon the senses of the subject, must be allowed on all hands to be a thing altogether *sui generis*, and without a parallel in any other branch of the treatment of animals by their natural master.

It is impossible not to wish that some attempts should be made upon other beasts, with a view of testing the powers of this wonder-working system. We might more especially desire to see what it could do with other creatures of the genus *equus*, hitherto untamable.

Let any one observe the behaviour of the zebra in the Regent's Park, his restless desire to gnaw through the bars of his prison, and the savage way in which he receives any advances to kindness on the part of visitors; reflecting upon the fact, that, while his congener the *quagga*, is tamed with tolerable facility, the beautiful zebra has as yet successfully rebelled against man's dominion; let any one, I say, reflect upon all this, and I think he will agree that a most interesting field is here open for the talent of our modern horse-tamers!

It would be exceedingly curious if it should turn out in the end that the *horse* is the only quadruped, even in his own *genus*, susceptible of being brought under this wonderful influence, whatever it may be.

THE SLAVE-TRADE IN TURKEY.

THE newspapers gave an account, a few months ago, of the seizure, near Smyrna, of a slave-ship, and the liberation of the slaves it contained—one of those farces with which the Turks, from time to time, gratify their western admirers, and amuse, or rather abuse, the European public. No one, not even their bitterest enemies, can refuse them credit for the perfection to which they carry this art of throwing dust in the eyes of their too lover-like protectors; nor is their merit the less, that their success can be accounted for by the consideration that it is the only art they deign to cultivate. Like the dangerous man of one book, they are masters in their one art. It is the Alpha and the Omega of their civilisation—their way of expressing their regard for public opinion. To seem and not to be, is the problem which has been so successfully worked by the Sublime Porte for the last century and a half, especially for the last half-century.

England and English ambassadors—the only people who exercise a disinterested philanthropy in looking after the domestic concerns of the Turks—have laboured for the last twenty years to persuade the sultan to abolish, in all its branches, this one of his peculiar institutions. It is instructive to mark the progressive steps by which the power of the charmer's voice has been made evident. First, the fair daughters of Circassia were ordered to be kept for sale henceforward only in private houses; then the slave-market, a large airy court surrounded by small rooms, and with some fine old trees in the centre, situated in the very busiest part of the bazaar, was ordered to be closed, and the human merchandise

was transferred for sale to unwholesome, underground vaults, near Sultan Suleiman's mosque; next, under the pressure of war, the importation of white slaves was positively forbidden; and finally, the traffic was declared to be abolished by an imperial firman. England and humanity had thus gained a notable victory—upon paper. The practical result of all these measures was, that last summer the slave-market of Constantinople was so overstocked with white ladies, that they had fallen to one-third of their usual price; while black slaves, plentiful as blackberries in autumn, were almost as valueless. Never since the massacres of Scio had the faithful been able to stock their establishments on such reasonable terms.

The fact is that the slave-trade is at this moment as active as ever in all parts of Turkey, excepting in Egypt, if Egypt must be called Turkey. Its pretended abolition is only one of those paper measures to which the government has recourse periodically, to satisfy the exigencies of some Frank, generally English, ambassador. Thank Heaven! while the representatives of other nations are carefully watching over their own interests, ours is even more actively and less selfishly promoting those of others.

To attempt to abolish slavery in a Mohammedan country is no easy task, to pretend to do so when those Mohammedans are Turks under Turkish rule, is almost a desperate one. The abolition of male slavery would be difficult, but perhaps, with certain exceptions, not impossible; but to do away with female slavery would be striking at the root of Turkish society itself. It would be the subversion of domestic life as Turks understand it, alike opposed to their habits and to their religious ideas. The sultan has no wives; it is beneath his dignity to marry—he has only slaves; he is the son and grandson of slaves, bought in the market with 'money current with the merchant.' The hundred or two of white ladies who bloom in the parterre of his harem, require a still larger number of black ones to wait upon them, for no respectable Mussulman woman in Turkey, however poor she may be, would accept domestic service. What is true of the sultan's harem, is equally true on a smaller scale of the households of all his subjects. Free domesticity is unknown among women, and the small shopkeeper's wife who with us would employ a charwoman or keep a servant-of-all-work, has in Turkey one or two slaves at her orders. Male slaves, black and white, are still more numerous than females, and they are the only servants who enjoy their master's confidence. We cannot imagine a Turk without slaves; he would be as helpless as a child. We have seen a Turk, one of the greatest men in the empire, ask one of the slaves who stood before him for his handkerchief. The slave told him he had it by him. The master fumbled on the cushions without finding it; the slave was not the less positive that he had it. He stepped forward to search for it, rolled his unwieldy lord first to one side, and then to the other, to see if it were under him, then he searched his pockets, and finally drew it from his wrist-band. Abbas Pacha, for it was no less a personage than the late viceroy of Egypt, submitted to this search with an unconcerned air, which shewed that it was a common affair; and after the five or six minutes employed in it, resumed the conference with the English consul-general which it had interrupted.

Our readers do not require to be told who are the unhappy creatures employed by the sultan and by all wealthy persons to watch over the morals of their harems, but it is necessary to refer to them, not only to denounce the inhuman treatment they have been subjected to, to qualify them for their degrading duties—and their number has of late years little, if at all, diminished—but still more to call attention to

the monstrous perversion, little known or thought of in England, by which these poor wretches have become the official guardians of the 'Prophet's' tomb at Medina, and of the great Mussulman temple in Mecca. The barbarous practice of which they are the victims has thus become elevated to a religious rite, not only connecting the institution of slavery with a religion whose fairest claim to our sympathy is the mitigation its author sought to effect in the condition of slaves, but making slavery in its most revolting form a part of the Mussulman ritual.

Yet, while we denounce the dishonesty of a pretended reform which can only deceive the wilfully blind, we have no wish to convey to our readers a false impression of the condition of the slave in Turkey. He is not, as a general rule, employed in field-labours; he is not driven to work by an overseer armed with a lash; he is subjected to few privations, and he is not generally discontented with his lot. Bought at an early age, the young boys are employed only in the lightest tasks, such as presenting a cup of coffee, carrying a pipe, or standing for hours in silence with folded hands before their master. They are the playfellows of his children, with whom the white slaves are frequently educated. These often rise to high rank through his influence, and not seldom marry his daughters. Two of the present sultan's brothers-in-law were bought in the market of Constantinople. The slave is regarded as the child of the family—no odious distinctions of colour are known in the east, though the negroes do not receive the same education as the whites, and a great man would hardly choose a black for his son-in-law. But even these, if accident advance them to office, as sometimes happens, become at once the equals of the proudest Osmanli. No idea of disgrace is attached to slavery—the black slaves of a great man regard themselves, and are regarded by him, as infinitely above his white hired servants. They belong to him; they are a part of himself; and if he give them their freedom, he provides for them, and the relationship of adoption does not cease. When freed, they become at once the equals of every one. The Turks are thoroughly democratic; they have no rank but that of service, no nobility but that of money. This is the tendency, or rather the condition of absolutism, for the sovereign is not absolute when the subjects have rights he must respect; and the Turkish democracy is the most practical of all—it is the equality not of freemen, but of slaves.

Fearful in domesticity, with no stimulus to industry, eating and sleeping without a thought of the morrow, the majority of the slaves are incapable of thinking or caring for themselves. To free them, therefore, is the greatest punishment that can be inflicted upon them. One of our friends in Cairo had long suffered in patience, or at least in silence, the whims and insolence of his wife's neutral attendant. At last, when his conduct became unbearable, neither exhortations nor threats having any effect, he determined to punish him. He did not sell him—he gave him his freedom. The poor useless wretch, when days went by, and he was not, as he supposed he must be, recalled to the house where he had so long been the tyrant, became as humble as he had been insolent, and going round to all his master's friends, besought their intercession for his restoration.

As a general rule, slaves are treated by their masters hardly indeed as reasoning beings, but with great kindness. As children, they may be whipped; but only great men venture to bastinado them when grown up. In fact, their masters are too completely in their power to venture to exasperate them by harshness. In the last two years we have known two men, one the governor of a town in Asia Minor, the other a wealthy merchant, murdered for their brutality

by their own slaves. It was from two of his white slaves that Abbas Pacha received at last the wages of his misdeeds.

The female slaves, in the seclusion to which they are condemned, suffer perhaps more than the men. They are exposed to the caprices of their white mistresses or of rival favourites, and the ill-humour of their guardians often falls heavily upon them. We remember seeing, a few years ago, in Damascus, one of the black keepers of the sultan's harem. He was living there in exile with the rank of pacha, having fallen into disgrace for a manual correction administered to one of the reigning favourites, who had found means to persuade the sultan that it had been undeserved. On the other hand, no slave who has born a child to her master can be sold; her children, whatever their colour, are regarded as legitimate, and come in for an equal share of their father's inheritance. If dissatisfied with their master, slaves of whatever colour or sex can oblige him, or rather have a legal right to oblige him, to sell them. Of course such a right can rarely be enforced. We know that with all this kindness there may coexist a large amount of tyranny and brutality, and in a large establishment there may be no small sum of unhappiness. We have known slaves appear before the *cadi* to claim the right of being sold, but we have never known a case where such an appeal was successful.

It is not, however, so much the condition of the slaves in their master's house which seems to warrant the interference of Europe, as the dreadful sufferings they are exposed to before reaching the market. The white slaves, at least the females, are exempt from these, and since the Circassians choose to traffic in their own flesh and blood, and the Turks to violate the prescriptions of their religion, which forbids the purchase of Mussulmans, we need not perhaps insist upon a reform which Russia will sooner or later effect. But for the black slaves, we have a right to interest ourselves, because, helpless and unwilling victims, they are subjected to sufferings even more horrible than those disclosed recently by the capture of a slave-ship off Jamaica.

The Egyptian frontiers are now closed to this traffic, and Constantinople depends for its supply upon Tripoli. The slaves thence procured are brought from the interior of Africa, a distance of 1000 or 1500 miles, sometimes from even more distant countries. They are the victims of the wars carried on by the chieftains of the black states nearest to Fezzan, for the sole sake of the prisoners, whom they sell to dealers from the Turkish territories. Murder stains this foul speculation in the first instance, and yet this is the least of the horrors which disgrace it. The captives are forced to follow on foot the caravans of their purchasers through sands hot as a furnace in the daytime, and cold as ice at night. Men and women, boys and girls, without clothes to cover them, or shoes to protect their feet, journey on for weeks, sometimes for months, supplied only with the scanty food which suffices to ward off death, and often suffering horribly from thirst in a region where wells are rare, and the heat of the sun often dries up or corrupts the contents of the water-skin. On one route which the caravans follow there is a distance of twelve days from one well to the next, and hundreds of victims annually whiten the desert with their bones. If only half arrive, the profit is still so enormous, that the loss seems trifling to the hardened wretches in whose eyes a slave is only merchandise. The survivors who reach Tripoli or Bengazi are carefully fed, that they may recover flesh, but they are still left in their almost primitive nakedness, shivering from the cold of a climate so different from their native tropics, that the buyers may have ocular demonstration that they are really

freely imported. The Turks prefer slaves who have as yet received no instruction. The slave-trade is the principal branch of commerce in Tripoli, and up to the present time it has been encouraged by the government in every possible way, even to the loss of more legitimate traffic. The number of slaves exported from Tripoli in 1854 was three times larger than under the independent days twenty years previously. About a year ago, after the publication of the firman forbidding the trade, we had occasion to speak with a merchant whose house is on the south-west frontier of Tripoli, and who trades to Timbuctoo. "What will become of your trade now, if this firman is enforced?" was the question we asked. "It would be time enough to answer you," he said, "when the firman is acted upon; but in those countries there is no want of objects of traffic. Slaves are at present the most profitable; but when these will no longer pay, there remain ivory, gold-dust, ostrich-feathers, and many other commodities. The people of the inner country cannot do without the articles we carry to them, and they will soon find wherewithal to purchase them. God is generous." He seemed little disturbed by the idea of the suppression of the trade; but whether from a conviction that this was not really intended, or from the confidence that other profitable investments would be found, we do not pretend to say. The goods exchanged for slaves are coarse cottons, paper, and small articles of hardware. It will be impossible to abolish the trade in men with all its attendant horrors, so long as slavery is permitted to exist in any shape in Turkey. Only its final abolition can put a stop to importations which the authorities both in Tripoli and Constantinople are interested in encouraging. Even the sultan's ships-of-war are used for the conveyance of slaves.

We can understand the desperate efforts made by the Turk to maintain this institution; but we profess ourselves unable to understand or to forgive the lukewarmness in the cause of abolition of his European supporters. The very argument which induces the Turk to resist the attempt, is the strongest that can be urged in its favour. The abolition of slavery would effect a radical change in Turkish society; and if we demanded it on no other grounds, we should call for it on this one. If Turkey has become a European state, it can be permitted to take a place in the congress of Christian nations only on the condition of remodelling, not the government alone, but still more the social relations of its subjects. It is vain to hope for any real amelioration in these till slavery be abolished in every corner of the empire.

But if slavery be an essential institution of Islam, then we are bound to hunt the professors of such a creed out of Europe. Humanity has a right to be intolerant of a standing offence against her laws; and if she proclaim a crusade in their vindication, freedom of all nations and of all creeds will acknowledge that her object is holy. But this is not the case. Islam found slavery established, and it mitigated its rigours. In Tunis, slavery has for many years been entirely done away with—an unanswerable argument, by the way, in favour of the independence of the bey, whom our English policy seems inclined to reduce to his long-forgotten subjection to Turkey. If, on the part of the Turkish government, the desire to abolish slavery were sincere, and not a mere pretence to blind the people of Europe to the real nature of their rule, it would not be difficult to bring it about. The first step necessary is to cut off the supply. To effect this, a couple of steamers cruising off the coast of Tripoli, backed by more stringent orders issued to the English consul, would be sufficient; and the waters of the Mediterranean would no longer be stained by this traffic. The traditions of Islam itself

would go far towards extirpating domestic slavery; for the Arabian prophet teaches that the granting his freedom to a slave is a meritorious work in the eyes of God; he even enjoins it as a propitiatory sacrifice on certain occasions. In the opinions of all pious Mussulmans, it is not lawful to retain a slave who has embraced Islam in servitude more than a short number of years. It would therefore be enough to forbid the sale of slaves from this time forwards, either publicly or privately, and to decree the freedom of all slaves whatever after the lapse of a brief term. This would lead to their speedy emancipation; for their masters would in general rather free them at once of their own accord, than allow them to acquire their liberty as a right. Of course the law prohibiting the sale of slaves must be accompanied by the fixing of express punishments for its transgression; its mere publication and communication to the European ambassadors would give it no efficacy.

The Turks are too thoughtless to consider the sufferings of the poor slaves before they reach their hands; they only remember that they were idolaters, and that they have made them Mussulmans. They are persuaded that God has put them into their power that they may save their souls. There is every excuse to be made for the Turks, who seek to evade a change which would revolutionise their habits of life, and whose necessity as a matter of humanity they cannot appreciate; but there is no excuse for their government, which thus scatters firmans broadcast over Europe, for the sake of propitiating a public opinion which it seeks to deceive; and still less is it possible to excuse the Christian diplomacy which stands smiling by and winks, lending the sanction of its silence to the bad faith of its protégés.

OCEOLA:

A ROMANCE.

CHAPTER LVIII.—OLD HICKMAN.

THE morning after, I went as usual to the recruiting quarters. Gallagher was along with me, as was this day the volunteers were to be 'mustered upon service,' and our presence was necessary at the signing of the oath.

The administrative company was collected, forming a troop.

A goodly table in number than appearance. They more respected volunteers; but as each individual were 'mounted in quartermaster, no two were either had been his own alike. Nearly all carried rifles, armed or mounted a few who shouldered the old though there were a few of revolutionary times—and family musket—a renowned with single or double some were simply arched, however, loaded with barrelled shot-guns. The no contemptible weapons heavy buck-shot, would have. There were pistols of in a skirmish with Indian brass-butted holsters to many sorts—from the huge and double barrelled—but small pocket-pistols—single celebrated 'Colt's'† had no revolvers, for as yet the frontier warfare. Every not made its appearance in fringe, dagger-shaped with volunteer carried his knife—some water number were ornamented hafts; while the grasse in use among long, keen blades, similar to the regular troops.

* In the United States, a volunteer corps is elected by the officers and elected, if the government accept its services, to serve men are then 'mustered in'—in other words, sworn in for a fixed period, under exactly the same regulations as the regular troops, with like pay, rations, &c.

† The military corps first armed with Colt's pistol warfare regiment of Texan Rangers. Its first trial in actual warfare occurred in the war between the United States and Mexico, a skirmish with the guerilla band of Padre Jaranto. The guerillas were put hors de combat in less than fifteen minutes by this effective weapon.

butchers. In the belts of many were stuck small hatchets, an imitation of the Indian tomahawk. These were to serve the double purpose of cutting a way through the brushwood, or breaking in the skull of a savage, as opportunity might offer.

The equipments consisted of powder-horns, bullet-pouches, and shot-belts—in short, the ordinary sporting gear of the frontiersman or amateur hunter when out upon the 'still hunt' of the fallow deer.

The 'mount' of the troop was as varied as the arms and accoutrements: horses from thirteen hands to seventeen; the tall, raw-boned steed; the plump, cob-shaped roadster; the tight, wiry native of the soil, of Andalusian race; * the lean, worn-out 'critter,' that carried on his back the half-ragged squatter, side by side with the splendid Arabian charger, the fancy of some dashing young planter who bestrode him, with no slight conceit in the grace and grandeur of his display. Not a few were mounted upon mules, both of American and Spanish origin; and these, when well trained to the saddle, though they may not equal the horse in the charge, are quite equal to him in a campaign against an Indian foe. Amid thickets—through forests of heavy timber, where the ground is a marsh, or strewn with logs, fallen branches, and matted with prostrate parasites, the hybrid will make way safely, when the horse will sink or stumble. Some of the most experienced backwoods hunters, while following the chase, prefer a mule to the high-mettled steed of Arabia.

Motley were the dresses of the troop. There were uniforms, or half-uniforms, worn by some of the officers; but among the men no two were dressed in like fashion. Blanket-coats of red, blue, and green; lincey-woobseys of coarse texture, gray or copper coloured; red flannel shirts; jackets of brown linen, or white—some of yellow nankin cotton—a native fabric; some of sky-blue cottonade; hunting-shirts of dressed deer-skin, with moccasins and leggings; boots of horse or alligator hide, highlows, brogans—in short, every variety of *chasseure* known throughout the States.

The head-gear was equally varied and fantastic. No stiff shaks were to be seen there; but caps of skin, and hats of wool and felt, and straw and palmetto-leaf, broad-brimmed, scuffed, and slouching. A few had forage-caps of blue cloth, that gave somewhat of a military character to the wearers.

In one respect, the troop had a certain uniformity; they were all eager for the fray—burning for a fight with the hated savages, who were committing such depredations throughout the land. When were they to be led against them? This was the inquiry constantly passing through the ranks of the volunteer array.

Old Hickman was among the most active. His age and experience had procured him the rank of sergeant by free election; and I had many opportunities of conversing with him. The alligator-hunter was still my true friend, and devoted to the interests of our family. On this very day I chanced to be with him alone, when he gave proof of his attachment by volunteering a conversation I little expected from him. Thus he began:

'May a Injun sculp me, lieutenant, if I kin bar the thought o' that puke a marrin' yer sister.'

'Marrying my sister—who?' I inquired in some surprise. Was it Gallagher he meant?

'Why, in coorse the fellar as everybody sex is a goin' to—that cussed pole-cat o' a critter, Ary Ringgold.'

'Oh! him you mean? Everybody says so, do they?'

'In coorse—it's the hul talk o' the country. Durn me, George Randolph, if I'd let him. Yur sister—the putty critter—she ur the finest an' the hansest gurl in these parts; an' for a durned skunk like thet, not'thustandin' all his dollars, to git her, I can't a bear to hear o't. Why, George, I tell you, he'll make her mis'able for the hul term o' her nat'ral life—that ere's what he'll be sartint to do—durnation to him!'

'You are kind to counsel me, Hickman; but I think the event you dread is not likely ever to come to pass.'

'Why do people keep talkin' o't, then? Everybody says it's a goin' to be. If it wan't thet I'm an old friend o' yar father, George, I wudn't ha' tuk sich a liberty; but I war his friend, an' I im yar friend; an' thurfor it be I hev spoke on the matter. We may talk o' Injune; but thur ain't ne'er a Injun in all Floridy as big a thief as them Ringolds—father an' son, an' the hul kit o' them. The old un, he's clurred out from hyar, an' whar he's gone to 'tain't hard to tell. Ole Scratch hez got hold o' him, an' I reck'n he'll be catchin' it by this time for the deviltries he carried on while about hyar. He'll git paid up sick for the way he treated them poor half-breeds on tother side the crick.'

'The Powells?'

'Ye-es—that wur the durndest piece o' injustice I ever know'd o' in all my time. By —, it wur!'

'You know what happened them, then?'

'Sartintly I do; every trick in the hul game. 'Twar a leetle o' the meanest transackshun I ever know'd a white—an' a white that called himself a gentleman—to have a hand in. By —, it war!'

Hickman now proceeded, at my request, to detail with more minuteness than I had yet heard them, the facts connected with the robbery of the unfortunate family.

It appeared by his account that the Powells had not voluntarily gone away from the plantation; that, on the contrary, their removal had been to the friendless widow the most painful thing of all. Not only was the land of great value—the best in the whole district—but it had been to her the scene of a happy life—a home endeared by early love, by the memory of a kind husband, by every tie of the heart's affection; and she had only parted from it when driven out by the strong arm of the law—by the staff of the sheriff-officer.

Hickman had been present at the parting scene, and described it in rough but feeling terms. He told me of the sad unwillingness which the family exhibited at parting; of the indignant reproaches of the son—of the tears and entreaties of mother and daughter—how the persecuted widow had offered everything left her—her personal property—even the trinkets and jewels—souvenirs given her by her departed husband—if the ruffians would only allow her to remain in possession of the house—the old homestead, consecrated to her by long happy years spent under its roof.

Her appeals were in vain. The heartless persecutor was without compassion, and she was driven forth.

Of all these things, the old hunter spoke freely and feelingly; for although a man of somewhat vulgar speech and rough exterior, he was one whose heart beat with humanity, and who hated injustice. He had no friendship for mere wrong-doers, and heartily detested the whole tribe of the Ringolds. His narration rekindled within me the indignant emotions I had experienced on first hearing of this monstrous act of cruelty; and my sympathy for Ocoola—interrupted by late suspicions—was almost restored, as I stood listening to the story of his wrongs.

* The horse was introduced into Florida by the Spaniards, hence the breed.

CHAPTER LIX.

A HASTY MESSENGER.

In the company of Hickman, I had walked off to some distance from the crowd, in order that our conversation should be unrestrained.

As the moments passed, the old hunter warmed into greater freedom of speech, and from his manner I fancied he had still other developments to make. I had firm faith in his devotion to our family—as well as in his personal friendship for myself—and once or twice I was on the eve of revealing to him the thoughts that rendered me unhappy. In experience, he was a sage, and although a rude one, he might be the best counsellor I could find. I knew no other who possessed half his knowledge of the world—for Hickman had not always lived among the alligators; on the contrary, he had passed through various phases of life. I could safely trust to his devotedness: with equal safety I might confide in the resources of his judgment.

Under this belief, I should have unburdened myself of the heavy secrets weighing upon my mind—of some of them at least—had it not been that I fancied he already knew some of them. With the reappearance of Yellow Jake I knew him to be acquainted: he alleged that he had never felt sure about the mulatto's death, and had heard long ago that he was alive; but it was not of him I was thinking, but of the designs of Arens Ringgold. Perhaps Hickman knew something of these. I noticed that when his name was mentioned in connection with those of Spence and Williams, he glanced towards me a look of strange significance, as if he had something to say of these wretches.

I was waiting for him to make a disclosure, when the footfall of a fast-going horse fell upon my ear. On looking up, I perceived a horseman coming down the bank of the river, and galloping as earnestly as if riding a 'quarter-race.'

The horse was white, and the rider black; I recognised both at a glance; Jake was the horseman.

I stepped out from among the trees, in order that he should see me, and not pass on to the church that stood a little beyond. I hailed him as he advanced.

He both saw and heard me; and abruptly turning his horse, came galloping up to the spot where the old hunter and I were standing.

He was evidently upon an errand; but the presence of Hickman prevented him from declaring it aloud. It would not keep, however, and throwing himself from the saddle, he drew near me, and whispered it into my ear. It was just what I was expecting to hear—Arens Ringgold was at the house.

'That dam nigga am thar, Masar George.'

Such was literally Jake's muttered announcement.

I received the communication with as much show of tranquillity as I could assume: I did not desire that Hickman should have any knowledge of its nature, nor even a suspicion that there was anything extraordinary upon the *tapis*; so, dismissing the black messenger with a word, I turned away with the hunter; and, walking back to the church enclosure, contrived to lose him in the crowd of his comrades.

Soon after, I released my horse from his fastening; and, without saying a word to any one—not even to Gallagher—I mounted, and moved quietly off.

I did not take the direct road that led to our plantation, but made a short circuit through some woods that skirted close to the church. I did this to mislead old Hickman or any other who might have noticed the rapid arrival of the messenger; and who, had I gone directly back with him, might have held guesses that all was not right at home. To prevent this, I appeared to curious eyes, to have gone in an opposite direction to the right one.

A little rough riding through the bushes brought me out into the main up-river road; and then, sinking the spur, I galloped as if life or death were staked upon the issue. My object in making such haste was simply to get to the house in time, before the clandestine visitor—welcome guest of mother and sister—should make his adieus.

Strong reasons as I had for hating this man, I had no sanguinary purpose; it was not my design to kill Arens Ringgold—though such might have been the most proper mode to dispose of a reptile so vile and dangerous as he. Knowing him as I did, freshly spurred to angry passion by Hickman's narrative of his atrocious behaviour, I could at that moment have taken his life without fear of remorse.

But although I felt fierce indignation, I was yet neither mad nor reckless. Prudential motives—the ordinary instinct of self-safety—still had their influence over me; and I had no intention to imitate the last act in the tragedy of Samson's life.

The programme I had sketched out for myself was of a more rational character.

My design was to approach the house—if possible, unobserved—the drawing-room as well—where of course the visitor would be found—an abrupt *embryo* upon the scene—both guest and hosts taken by surprise—the demand of an explanation from all three—a complete clearing-up of this mysterious *embroglio* of our family relations, that was so painfully perplexing me. Face to face, I should confront the triad—mother, sister, wooer—and force all three to confession.

'Yes!' soliloquised I, with the eagerness of my intention driving the spur into the flanks of my horse—'Yes—confess they shall—they must—one and all, or'—

With the first two I could not define the alternative; though some dark design, based upon the slight of filial and fraternal love, was lurking within my bosom.

For Ringgold, should he refuse to give the truth, my resolve was first to 'cowhide' him, then kick him out of doors, and finally command him never again to enter the house—the house, of which henceforth I was determined to be master.

As for etiquette, that was out of the question; at that hour, my soul was ill attuned to the observance of delicate ceremony. No rudeness could be amiss, in dealing with the man who had tried to murder me.

CHAPTER LX.

A LOVE'S GIFT.

As I have said, it was my design to make an entrance unobserved; consequently, it was necessary to observe caution in approaching the house. To this end, as I drew near the plantation, I turned off the main road into a path that led circuitously by the rear. This path would conduct me by the hommock, the bathing-pond, and the orange-groves, without much danger of my approach being noticed by any one. The slaves at work within the enclosures could see me as I rode through the grounds; but these were the 'field-hands.' Unless seen by some of the domestics, engaged in household affairs, I had no fear of being announced.

My messenger had not gone directly back; I had ordered him to await me in an appointed place, and there I found him.

Directing him to follow me, I kept on; and having passed through the fields, we rode into the thick underwood of the hommock, where halting, we dismounted from our horses. From this point I proceeded alone.

As the hunter steals upon the unexpected game, or the savage upon his sleeping foe, did I approach

the house—my home, my father's home, the home of mother and sister. Strange conduct in a son and a brother—a singular situation.

My limbs trembled under me as I advanced, my knees knocked together, my breast was agitated by a tumult of wild emotions. Once I hesitated and halted. The prospect of the unpleasant scene I was about to produce stayed me. My resolution was growing weak and undecided.

Perhaps I might have gone back—perhaps I might have waited another opportunity when I might effect my purpose by a less violent development—but just then voices fell upon my ear, the effect of which was to strengthen my wavering resolves. My sister's voice was ringing in laughter, that sounded light and gay. There was another—only one. I easily recognised the squeaking treble of her despicable suitor. The voices remaddened me—the tones stung me, as if they had been designedly uttered in mockery of myself. How could she behave thus? how riot in joy, while I was drooping under dark suspicions of her misbehaviour?

Piqued as well as pained, I surrendered all thought of honourable action; I resolved to carry through my design, but first—to play the listener.

I drew nearer, and heard clearer. The speakers were not in the house, but outside, by the edge of the orange-grove. Softly treading, gently parting the boughs, now crouching beneath them, now gliding erect, I arrived unobserved within six paces of where they stood—near enough to perceive their dresses glistening through the leaves—to hear every word that passed between them.

Not many had been spoken, before I perceived that I had arrived at a peculiar moment—a crisis. The lover had just offered himself for a husband—had, perhaps for the first time, seriously made his declaration. In all probability it was this had been eliciting my sister's laughter.

'And really, Mr Ringgold, you wish to make me your wife? You are in earnest in what you have said?'

'Nay, Miss Randolph, do not mock me; you know for how many years I have been devoted to you.'

'Indeed, I do not. How could I know that?'

'By my words. Have I not told you so a hundred times?'

'Words! I hold words of little value in a matter of this kind. Dozens have talked to me as you, who, I suppose, cared very little about me. The tongue is a great trifier, Mr Arens.'

'But my actions prove my sincerity. I have offered you my hand and my fortune; is not that a sufficient proof of devotion?'

'No, silly fellow; nothing of the sort. Were I to become your wife, the fortune would still remain your own. Besides, I have some little fortune myself, and that would come under your control. So you see the advantage would be decidedly in your favour. Ha, ha, ha!'

'Nay, Miss Randolph; I should not think of controlling yours; and if you will accept my hand'—

'Your hand, sir? If you would win a woman, you should offer your heart—hearts, not hands, for me.'

'You know that is yours already; and has been for long years: all the world knows it.'

'You must have told the world, then; and I don't like it a bit.'

'Really, you are too harsh with me: you have had many proofs of how long and devotedly I have admired you. I would have declared myself long since, and asked you to become my wife'—

'And why did you not?'

Ringgold hesitated.

'The truth is, I was not my own master—I was under the control of my father.'

'Indeed?'

'That exists no longer. I can now act as I please; and, dearest Miss Randolph, if you will but accept my hand'—

'Your hand again! Let me tell you, sir, that this hand of yours has not the reputation of being the most open one. Should I accept it, it might prove sparing of pin-money. Ha, ha, ha!'

'I am assailed by enemies. I swear to you, that in that sense you should have no cause to complain of my liberality.'

'I am not so sure of that, notwithstanding the oath you would take. Promises made before marriage are too often broken after. I would not trust you, my man—not I, i' faith.'

'But you can trust me, I assure you.'

'You cannot assure me; besides, I have had no proofs of your liberality in the past. Why, Mr Ringgold, you never made me a present in your life. Ha, ha, ha!'

'Had I known you would have accepted one—it would gratify me—Miss Randolph, I would give you anything I possess.'

'Good! Now, I shall put you to the test: you shall make me a gift.'

'Name it—it shall be yours.'

'Oh, you fancy I am going to ask you for some trifling affair—a horse, a poodle, or some bit of glittering *bijouterie*. Nothing of the sort, I assure you.'

'I care not what. I have offered you my whole fortune, and therefore will not hesitate to give you a part of it. Only specify what you may desire, and I shall freely give it.'

'That sounds liberal indeed. Very well, then, you have something I desire to possess—and very much desire it—in truth, I have taken a fancy to be its owner, and had some designs of making offers to you for the purchase of it.'

'What can you mean, Miss Randolph?'

'A plantation.'

'A plantation!'

'Exactly so. Not your own, but one of which you are the proprietor.'

'Ah!'

'I mean that which formerly belonged to a family of half-bloods upon Tupelo Creek. Your father purchased it from them, I believe?'

I noted the emphasis upon the word 'purchased.' I noted hesitation and some confusion in the reply.

'Yes—yea,' said he; 'it was so. But you astonish me, Miss Randolph. Why care you for this, when you shall be mistress of all I possess?'

'That is my affair. I do care for it. I may have many reasons. That piece of ground is a favourite spot with me; it is a lovely place—I often go there. Remember, my brother is owner here—he is not likely to remain a bachelor all his life—and my mother may desire to have a home of her own. But no; I shall give you no reasons; make the gift or not as you please.'

'And if I do, you will'—

'Name conditions, and I will not accept it—not if you ask me on your knees. Ha, ha, ha!'

'I shall make none, then: if you will accept it, it is yours.'

'Ah, that is not all, Master Arens. You might take it back, just as easily as you have given it. How am I to be sure that you would not? I must have the deeds.'

'You shall have them.'

'And when?'

'Whenever you please—within the hour, if you desire it.'

'I do, then. Go, get them! But remember, sir, I make no conditions—remember that.'

'Oh,' exclaimed the overjoyed lover, 'I make none. I have no fears; I leave all to you. In an hour, you shall have them. Adieu!'

And so saying, he made a hurried departure.

I was so astonished by the nature of this dialogue—as taken by surprise at its odd ending—that for a time I could not stir from the spot. Not until Ringgold had proceeded to some distance did I recover self-possession; and then I hesitated what course to pursue—whether to follow him, or permit him to depart unmolested.

Virginia had gone away from the ground, having glided silently back into the house. I was even angrier with her than with him; and, obedient to this impulse, I left Ringgold to go free, and went straight for an explanation with my sister.

It proved a somewhat stormy scene. I found her in the drawing-room in company with my mother. I stayed for no circumlocution; I listened to no denial or appeal, but openly announced to both the character of the man who had just left the house—openly declared him my intended murderer.

'Now, Virginia! sister! will you marry this man?'

'Never, George—never! I never intended it—Never!' she repeated emphatically, as she sank upon the sofa, burying her face in her hands.

My mother was incredulous—even yet incredulous!

I was proceeding to the proofs of the astounding declaration I had made, when I heard my name loudly pronounced outside the window: some one was calling me in haste.

I ran out upon the verandah to inquire what was wanted.

In front was a man on horseback, in blue uniform, with yellow facings—a dragoon. He was an orderly, a messenger from the fort. He was covered with dust, his horse was in a lather of sweat and foam. The condition of both horse and man showed that they had been going for hours at top-speed.

The man handed me a piece of paper—a dispatch hastily scrawled. It was addressed to Gallagher and myself. I opened and read:

'Bring on your men to Fort King as fast as their horses can carry them. The enemy is around us in numbers; every rifle is wanted—has not a moment.'

CLARENCE.

THE MONTH:

SCIENCE AND ARTS.

Some of our hard-worked savans took advantage of the Easter holidays to go and refresh themselves with the sight of primroses and young grass in the country; those who were botanists seized the opportunity for new observations on the development of buds; for certain among them—the botanists, not the buds—are excogitating a new theory with respect to those vernal phenomena.—The Bombay Geographical Society announce in their proceedings that they have received a specimen of the walking-leaf from Java with eggs and young; and what seems more curious still, a walking-flower, described 'as a creature with a white body, pink spots, and crimson border.'—The discovery has been made in Algiers that a field may be planted with maider, and fed off by cattle for three or four years, without any detriment to the roots, which are afterwards as good for dyers' uses as those cultivated in the ordinary way.—The sweet sorgho (*Sorghum saccharatum*) is found also to be good food for cattle; and paper can be made of the stalks.—The sorgho, which, as our readers will remember, was introduced from China, and is known as the Chinese sugar-cane, has attracted great attention throughout the United States, and in every state experiments have been made on its cultivation.

Among the most successful are those by Mr Lovering of Philadelphia: he planted half an acre; the cane grew from ten to twelve feet high, and yielded excellent sugar, specimens of which were exhibited both raw and leaf. It appears that frost is not prejudicial to the sorgho; but it deteriorates in the hot autumn, or Indian summer of the States, the juice being affected in a way that prevents crystallization. One instance is reported of an acre of sorgho having produced 6800 gallons of juice, which is equivalent to nearly 4500 pounds of sugar, and 274 gallons of molasses. Might not this cane be profitably cultivated in some of the countries of Southern Europe, and take the place of diseased and dying vines? Let Baron de Forrester, who has the welfare of Portugal so much at heart, take the hint. Trials might be made, too, in Australia and Natal.—The quantity of maple-sugar made in the United States is about 80 million pounds a year.—It has recently been found that soap is the best clarifier that can be used in the manufacture of sugar. The effect of guano on the growth of the sugar-cane has been strikingly shown at Mauritius. Before that fertilizer was introduced, the produce was about 2500 pounds per acre; now it is 6000, and on some estates, even 8000 pounds to the acre.

Agassiz, who resists all the royal and imperial offers made to lure him back from America to Europe, is publishing a great work, entitled *Contributions to the Natural History of the United States*; two bulky volumes have appeared, and eight more are to follow. He has good opportunities for study, for it is said that the Academy of Natural Sciences at Philadelphia has the largest ornithological collection in the world—27,000 specimens of birds.—In addition to boring artesian wells along their south-western desert-routes, the United States government have introduced the camel in experimental journeys over those scorching plains, and with satisfactory results.—Henceforth, Ottawa, a young city, admirably situated for agriculture and trade, is to be the capital of Canada.—The president of the Canadian Institute, established at Toronto, congratulated the members in his last annual address, that their number is now 600; that the Journal of their Proceedings is regularly and successfully published once a month; that the Toronto Observatory, founded twenty years ago to co-operate in the great scheme of magnetic observations instituted by the Royal Society, was not abandoned when the object was accomplished; but, at the instance of the Institute, was provided for by the provincial government, and has been rebuilt with stone, and equipped with the best instruments at a cost of £5000. This is something to be proud of, for it is the only one of the colonial observatories which has not been given up. More than 100,000 observations were made at Toronto, and, owing to the peculiar local phenomena, they are of especial value. General Sabine has published them, and brought out the results in three quarto volumes; a fourth is yet to appear; and these, to quote the president's words, 'will carry the name of Toronto into all parts of the earth where science is cultivated; and it is not too much to say that the name of a Canadian city, which will be sought for in vain on maps twenty years ago, has now become, by means of its observatory, familiar in the mouths of European savans as a household word.' The Prussian authorities are recommending all Prussian emigrants to choose Canada in preference to all other countries, especially to Brazil.

Two Frenchmen claim to have ascended to the very summit of Chimborazo—a feat that baffled Humboldt.—At a recent meeting of the Geographical Society, Mr Graham gave an account of his travels to a Scripture land hitherto unvisited by Europeans, and his exploration of the new ruined cities, which

were once under the rule of Og, king of Bashan. Considering their antiquity, they are in remarkable preservation; the houses lofty, with great slabs of stone for roofs, and stone doors carved into panels, and ornamented. A dead silence prevailed; yet so few are the signs of decay, that Mr Graham paced the streets expecting every moment to see one of the old inhabitants step forth to meet him.

Sir George Grey, governor of Cape Colony, is making a collection of all the newspapers, vocabularies, and scriptures in native African dialects which he can meet with, to be kept in the Library at Cape Town. He does not confine his researches to the south, but intends to include the whole of Africa in his scheme, if possible. This is doing a good work, one that will be eminently useful to philologists, and prove the means of preserving a knowledge of dialects which, in the course of a generation or two, will no longer exist as living speech. Mr Moffat (Livingstone's father-in-law), assisted by Mr Ashton, is publishing a monthly paper in the Bechuana language at Kuruman.

In commercial phrase, Turkey is looking up, and is about to satisfy one of her chiefest wants—means of communication between the interior and the sea-coast. Smyrna already exports twice as much as any other Turkish port; what will it be when the projected railway of seventy miles to Aidia is completed, running through the rich fruit district of Asia Minor, along the valley of the Meander, and within nine miles of ancient Ephesus? It is expected that marvellous quantities of silk, grain, and madder, besides fruit, will be brought down to Smyrna. Another line of 250 miles is to run from Samsoun, on the Black Sea, through Pontus, to Sivas, the ancient Sevestia, in the valley of the Halys. There is something almost startling at first in the thought of railways, screaming locomotives, and first, second, and third class penetrating those old countries, rattling along within three leagues of one of the Seven Churches, and carrying new resources and new energies into the land which recalls the names of Mithridates, and Pythodorus, and Caesar's *Veni, vidi, vici*.—Experience has shewn in Egypt, on the line from Alexandria to Cairo, that the greatest profit is made from the fares of the fellahs—small peasant-proprietors—who travel in numbers, and with a frequency truly surprising. We commend this fact to the consideration of railway directors here at home who may be in doubt as to the advantage of running third-class carriages with every train.

Russia is doing great things in the south—levelling roads, improving old harbours, and deepening the mouths of the Volga at Astrakhan by steam-power. The American engineers who went to raise the sunken vessels in the harbour of Sebastopol, have signally failed. The teredo, that active tunnel-borer, had anticipated them, so that the great men-of-war were found too weak to be lifted, and to have too little cohesion to be blown up; so there is nothing for it but to leave the once proud fleet at the bottom till the worms have finished it. Altogether, eighty vessels were sunk—an amazing number.—Elsewhere, Brother Jonathan has been more successful: his enterprising divers have got into the hold of the *San Pedro*, a Spanish war-ship that blew up in the Bay of Cumana in 1815, with three million dollars on board, while on her way to punish the revolutionary Mexicans.

The Board of Trade are going to do something wise and praiseworthy, and that is to set up a barometer for the use of fishermen at the several fishing-ports around the coast, beginning with Scotland; thus accomplishing the recommendation made by Dr Stark, president of the Meteorological Society of Scotland, as mentioned in our last. It appears that

in one or two places where a barometer was already kept, the men seeing a fall of the mercury, stayed at home; while at neighbouring ports, where no such friendly monitor was at hand, the men put to sea, were caught in a storm, and some perished.—An endeavour is making to advance meteorology as a science, by a widely extended scheme of observations, which will include Petersburg, Algiers, Dublin, Lisbon, Greenwich, Bourdeaux, and other places—Paris to be the centre for discussion and publication. To facilitate the work, the mean of the several phenomena at the different stations will first be established, so that only the variations from that mean will have to be recorded. Especial attention is to be paid to the wind, on which the weather so much depends; and as the stations will intercommunicate by telegraph, it is thought that predictions of changes of the weather will be possible.

During the past winter an unusual cold prevailed in the south of Europe, after a spring-like temperature had set in here in England. At Turin and Naples its rigour was excessive; at Ferrara the Po was frozen, and men and cattle crossed on the ice; Malta shivered; Constantinople was frozen up and half-starved for want of food, owing to the deep snow having blocked the streets and roads; the highlands of Algeria wore for a while a strange white winter-coat; and it even actually snowed at Cairo. We need hardly say that such a phenomenon was never before witnessed in Egypt, not even by the oldest inhabitant, nor yet his great-grandfather.

At Brussels on the 17th January an extraordinary perturbation of the magnet was observed, shewing a considerable excess in all the phenomena—intensity, declination, &c., which lasted nearly the whole day; an aurora, too, was visible in the early morn; and soon afterwards came the news of the earthquake in the Neapolitan territory on the night of the 16-17th. The earthquake shocks have not yet ceased; and the city of Naples itself has been shaken.—The convulsions have been felt further east, and we hear that Corinth has ceased to exist except as a heap of ruins.—Science has a footing in Naples, St Januarius notwithstanding, and a quarto volume has recently been published by the Academy of Sciences in that city, giving full particulars of the eruptions of Veanus in 1850 and 1855, with ample maps and plans; and there is no doubt that Signor Scauchi, a first-rate geologist, will draw up an account of the calamitous phenomena of the present year.—And, incredible as it may appear, there is a Royal Academy of Sciences doing good work at Madrid, publishing their *Memorias* in quarto, filled with able articles on the climate, geology, and natural history of the several provinces of Spain. One of the latest contains a geological description of the Sierra Morena.

Mr Dawson, inspector of roads, &c., at Newcastle-on-Tyne, has laid a Report before the corporation of that town, shewing the comparative cost of macadamised and paved roads. The maintenance, he says, of 275,249 square yards of paving for a year cost less than a half-penny a yard, while to keep up 115,096 yards of macadam cost, for the same period, 4½d. a yard. Hence there was an expenditure of £3000 more than would have been incurred for paving. Nearly 5000 tons of stone were broken and laid on the macadamised road; and of this, great part is wasted for want of heavy rollers to press it at once to a solid surface. In this latter respect, Hull sets a good example, for there the rollers are used.—It is known to engineers that in the fixing of screw-piles the timber is apt to twist, whereby its strength is diminished. M. Oudry, an engineer at Bayonne, has contrived a wrought-iron case or tube, in which he encloses the pile during the screwing in, then taking it off, uses it for others.—A school of

stokers is established at Lille, where the men are to be taught the elementary properties of steam, the utility and manipulation of the different parts of the machine, the way to burn coal with efficacy and economy, and so forth. With such a course of instruction as this, the loss and other ill consequences which attend on the ignorance of stokers will no longer have to be complained of; and in case of accident to the driver, there will be a man ready to take his place.—A late return shews that 109,660 persons are employed on the railways in the United Kingdom, exclusive of the lines not yet finished.

Messieurs Mourier and Vallent exhibit in Paris a new ornamental metal, to which they give the name *oride*, from its similarity in appearance to gold. It is made of pure copper, zinc, magnesia, salammoniac, and quicklime fused together; and when properly prepared, is very brilliant, and is easily cleaned by acidulated water.—And a metallic alloy is mentioned, composed of lead, tin, and bismuth, which is very fusible, and well suited for medals, ornaments, mouldings, and statuettes.—Veins of lead have been discovered in the base of Plinlimmon, near Llanidloes, of excellent quality, and so rich in silver as to yield twenty ounces per ton of the precious metal.—And in Huntingdonshire, on the estates of the Marquis of Huntley, at Orton, large deposits of iron-stone have been brought to light, and now only await the hand of industry and enterprise. But as regards iron, Cleveland will be for centuries to come our English California.

The Society of Arts have had their advertised statement and discussion about cotton, in the course of which it was shewn that if industry could only have fair-play in India, and land could be had on proper terms—two questions, by the way, of which Mr Ewart has given notice of motion in parliament—then we might get all the cotton we want from that great empire, and more. As it is, progress has been made. In 1834-35, India sent to England 38 million pounds of cotton; in 1855-56, 170 million pounds; and if we add to this the quantities sent to other countries, the total amounts to 287 million pounds.—Another subject discussed by the Society is electro-motive machines; and although Mr Allan, the author of the paper, feels confident that machines driven by electricity will some day be generally used as auxiliary to steam, the practical men who listened to him took a less hopeful view of the question.—M. Tréhonnais's paper on Agriculture in France, contained a bold summary of the causes which make cultivation of the soil such a miserable resource among our allies. One great evil is centralisation, attracting the principal landowners to the metropolis; another, the expenditure of enormous sums in the embellishment of Paris to the detriment of the country; so that artisans and labourers forsake their homes, fields remain uncultivated, and the population, as shewn by the last census, actually diminishes.

A few specimens of M. Niepce St Victor's photographs have been presented to the Royal Society. The especial merit of the new process is that the pictures will not fade. In a communication to the Photographic Society, M. Niepce says: 'Everything leads to the hope that pictures taken in this way will be much more stable than the photographs taken by the present process; and that this new mode of printing positives, so very simple and rapid, is the sought-for solution of the important problem of the absolute fixing of photographic pictures.' Another result will probably be, that all the operations of photography will come to be carried on in full daylight. It is now clear, from the French savant's discoveries, 'that light communicates to certain substances which it has fallen upon, a real activity; or better, that certain

bodies have the property of storing up light in a state of persistent activity.' It is found that the process is accelerated by the use of a heated metal plate; and we hear that an ingenious individual has exhibited to the Franklin Institute at Philadelphia copies of engravings taken by laying the engraving face downward on a prepared board, and passing a hot iron over the back.

HOMeward-BOUND.

ARE you sleeping—are you dreaming; are you dreaming,
love, of me?
Or are you waking, thinking of your sailor on the sea?
Of the day we roamed by Athol woods—your hand fast
locked in mine—
Of our day of happy, happy tryst on old Saint Valentine!

O Marion, O Marion, the gale is piping loud,
And the billows leap to mountains, and the foam lies like
a shroud;
Far, far from land, alone I stand, to watch till it be day,
Mid the rolling of the thunder, and the dashing of the
spray.

Sleep, sleep, my Marion—sleep and dream, my beautiful
—mine own!
Sleep is the orphan's silent land, and thou, love, art alone:
Sleep, till the swelling branches bend into an arching
dome;
Sleep, till the quiet leaves steal out to call the young
birds home.

It is night, and storm, and darkness, Marion; flashing
from the sky
Darts the fitful, lurid lightning, like a threat of God's
great eye;
But dream thou 'tis the Norland gleam, the harmless
Norland light
He sends but as the herald of the glory of his might!

Bless God, my darling, for the gift he dealeth unto thee,
Amid thy calm and sunny bowers, soft dreams of the wild
sea;
And to me, whose glimpses of the land are beautiful as
brief,
To me, the storm-tossed mariner, the love of the green
leaf!

O doubly sweet my thoughts of thee upon the surging
main,
And doubly dear the day shall dawn that brings me back
again;
When I tread your cottage-garden—pluck the wild-
flower from the wall—
With my arm around my Marion's neck—the sweetest
flower of all!

Blow, blow, ye winds! blow fierce and strong! the heaven
your breath command;
I care not, I, how fiercely, so ye blow to mine own love
land:
In the roar of the mighty waters my spirit shall rejoice,
So they drown not the glad music of my Marion's
welcome voice.

'Tis by Athol that she slumbers—'tis by Athol that she
strays;
O waft me, heavens! to Athol in the spring of the young
days:
There once more my steps shall wander—with thy hand
fast locked in mine—
By Athol woods, with thee, my Marion, on the old Saint
Valentine!

No. 226.

SATURDAY, MAY 1, 1858.

PRICE 1½d.

THE VILLAGE OF GHEEL.

In the midst of the extensive tracts of unreclaimed moorland that spread their barren wastes through great part of the northern provinces of Belgium, and the southern provinces of Holland, and are known under the name of the Campine, lies the little town, or rather village, of Gheel, the *chef-lieu* of the Belgian Campine, surrounded by a belt of verdant gardens, well-tilled fields, and humble but substantial farmsteads, which give it the appearance of a smiling oasis in the midst of the dreary desert that extends for miles around, and tell a tale of industry which at once prepossesses you in favour of a population that have won such results from so arid a soil. To Gheel and its immediate environs is attached a history so interesting that, were it more generally known, it would doubtless make this obscure corner of the earth an object of strong attraction to every philanthropic traveller in Belgium; and it is our hope that the subjoined sketch may be the means of directing towards it the attention of some who may perchance turn their knowledge to account for suffering humanity.

An ordinary stranger who, unacquainted with the peculiar history of the place, may saunter down the High Street of Gheel, with its neat whitewashed cottages backed by gardens opening into the fields, may find nothing in the aspect of the general population to attract his attention, except, perhaps, a prevalent character of quiet self-possession and innate gentleness and firmness, not unmixed with Flemish phlegm; but if he be a keen observer, he will most likely be struck by the extreme eccentricity of the rather frequent individual exceptions to this rule, who yet seem to excite no surprise among the inhabitants themselves. If it be Sunday, his curiosity will be further roused by the fact, that all these eccentric individuals are bending their steps towards the church of St Dymphne, the second in importance in the little town; while the mass of the more sedate townsmen and women are crowding into that of St Amand. Let him follow the minority into their church and take a survey of the edifice when service is over. On its walls he will find the solution of the mystery, and the secret of the great interest that attaches to Gheel. Here he may read, partly in sculpture, partly in painting, and partly in writing, how St Dymphne, the daughter of an Irish king in the seventh century, to evade the persecutions of her heathen father, fled from her native land in company with a Christian priest, and sought refuge in the solitary wilds of the Belgian Campine, where a chapel, erected to St Martin, and surrounded by a few huts built by pious votaries,

already formed the nucleus of the future town of Gheel. But neither distance nor the sanctity of her asylum could save the unhappy maiden from her cruel father, who, having discovered her hiding-place, repaired thither, and cut off her head with his own hands. Some poor lunatics, says tradition, who happened to be on the spot, and witnessed the ruthless deed, were restored to reason by a sight which might well have driven sane minds mad. In the gratitude of their hearts, they attributed their recovery to the intercession of the young martyr, who thenceforward was installed as the patroness of the insane. Attracted by the hope of further miracles, the relatives of other lunatics brought these to kneel before the cross erected over the martyred maiden's grave. Even when instant cure did not follow, hope was not abandoned, but the visits were repeated again and again, till pilgrimages of the insane to the tomb of St Dymphne became an established custom in the country. Frequently the patients were left in charge of the inhabitants of the hamlet gathered round St Martin's Chapel, who thus gradually acquired a practical knowledge of the treatment they required. Little by little this custom became an institution; the hamlet expanded into a village, the village into a town; farms and villages multiplied around it, and were at length erected into a commune. In the twelfth century the chapel of St Martin was replaced by a church dedicated to St Dymphne. In the fourteenth century, Pope Eugenius IV. gave a sanction to the established custom among the insane. Thenceforward, a constant stream of pilgrims continued to flow towards the consecrated spot; and thus Gheel, together with its environs, became what it is to this day, a colony of lunatics, and a hard-working, peaceful, free, and happy community, where, by the mere force of circumstances, were established already in the midst of the barbarism of the middle ages, those rules as to the treatment of the insane, which the medical science of the nineteenth century has pronounced to be the most efficacious for the cure of mental disease—namely, liberty of action and of locomotion, labour in the open air, removal from the scenes and associates of the previous life of the afflicted, gentle discipline, and active and devoted sympathy from those that surround them.

The pecuniary advantage, however small, to be derived from the reception of insane inmates in their homes, was no doubt the first inducement that led the small population of Gheel to accept the vocation of keepers of the lunatics that resorted to the tomb of St Dymphne. The sterility of the soil has ever rendered life harder in the Campine than in more

favoured regions. The duties of hospitality, though remunerated with a small sum, were in consequence more onerous to these poor peasants than they would have been elsewhere. To render them less so, it became a matter of necessity to allow the poor afflicted guest to live in every respect as a member of the family, to take part in the common repasts, to follow the members of the household to their daily avocations in garden, field, or house; for left alone he could not be, and special surveillance would necessitate the sacrifice of the time of one of the working members of the family. The presence of the lunatic during the daily work of the family led to a further step, which had a most beneficial effect upon his condition—namely, to his association in the labours of the family during his lucid intervals, and thus sprung up an intimacy and a mutual attachment which has established a kind of patriarchal relation between the insane entrusted to the care of the inhabitants of the commune of Gheel and their foster-fathers (*pères nourriciers*), which prevails to this day, and forms a striking contrast to the mutual distrust, and at least one-sided dislike which, under other circumstances, is so frequently found to exist between the insane and their keepers.

The people of Gheel have, moreover, a firm belief in the miracles that seemed to point out their country as a fit place for the cure and care of the insane; and this faith in a providential mission gives them a feeling of power and confidence in their dealings with their patients, which, together with the tender interest in this particular form of human infirmity, which is likewise transmitted from generation to generation, has really endowed this little community with a singular aptness for this particular vocation, and has developed a practical skill among them which is sometimes consulted with advantage by learned physicians. The whole community—men, women, and children—take an interest in the insane. A family who has no inmate of the kind, feel as if something were wanting to them, and hasten, when newcomers arrive, to supply the deficiency. The *père nourricier* is proud of the blooming and well-fed look of his boarder; and the family feel humiliated if their inmate look pale and dejected.

Many touching incidents are on record bearing witness to the bonds of affection which unite the poor afflicted ones of Gheel and their kind guardians. Often the *nourriciers* have been known to maintain their charges gratuitously, even after cure has been effected, when they have lost their relatives and have been left without support. Others have extended their kindness even to the poor relatives of the insane who have become members of their family. Another tells of a lady of noble appearance, and evidently highly educated, who, having been found in Brussels perfectly alone and in a state of insanity, so as to be unable to give any account of herself or her antecedents, was placed as a boarder with a farmer of Gheel in easy circumstances, in whose house she was treated with all the delicate respect due to her supposed rank and former position, though only the pauper allowance was paid for her. During twenty years she dined at a separate table, laid with the utmost neatness and care, while her host and hostess waited upon her. The inspector having one day made an observation on the subject, he was answered: 'Why, you see, sir, our little lady is evidently of good family, and we respect her very much. We also love our little lady, and wish to keep her long among us. I know very well that we shall never be paid for what we do for her; but we have no children, and she is our company.' Another medical inspector narrates how touched he was, on entering a farmhouse unexpectedly one day, to find that the insane guest was occupying the seat of honour in the chimney-

nook, and that the children, frightened at the sudden appearance of a stranger, sought refuge round the knees of the maniac, whom they seemed to look to as a natural protector, and who returned their confidence with a look and gesture of tender solicitude.

The mutual attachment that prevails generally among the insane in Gheel and their guardians was shewn on a large scale some few years ago, when several towns of Belgium which had, up to that period, been in the habit of sending their pauper lunatics to Gheel, determined to withdraw them from that place because of their being able to dispose of them elsewhere at a slight reduction of cost. *Nourriciers* and patients all wept bitterly at parting, and embraced each other most affectionately. Several of the lunatics hid themselves, in order to escape from the threatened separation, and others had to be removed by force. A striking example of how strongly the affectional life can be developed in those who are deprived of the light of reason; while the place that the lunatics hold in the households of Gheel, proves as strikingly that under such a system, these afflicted beings, commonly looked upon as outcasts of society, may even lead a life of useful activity—useful to others, as well as to themselves. For if Gheel is distinguished above all other communes in the Campine for the excellent condition of its corn-fields and grass-fields, its gardens and orchards, this material wellbeing is in a great measure owing to the revenues derived from the care of the insane, and also to the active co-operation of the latter during the course of a thousand years. They help to build the farms, to bring the heath under cultivation, to dig canals and bridges, to plant trees, and to tend cattle, those who are subject to intermitting fits of violence being sought in preference by the farmers as inmates and assistants, because the very violence of the paroxysms proves the vigour of their organism; and, in consequence, they are found to be energetic and industrious workers during their lucid intervals, while, by a happy logical sequence, the labour which enriches the farmer tends at the same time to ameliorate the condition of the labourer.

The more docile and tractable among the insane are engaged in indoor employments, such as carpentering, tailoring, shoe-making, lace-making, &c.; care being taken, as far as possible, to put each person to the trade he may have been previously acquainted with; and in every family without exception, the women, girls, and infirm old men, who may happen to be its inmates, take part in the household work without any apparent distinction being made between them and the servants or members of the family. According to the terms agreed upon for them, the lunatics are to give their services gratuitously; but the *pères nourriciers*, having learned from experience that remuneration, if ever so trifling, acts as a powerful stimulant, are in the habit of allowing their boarders ten or twenty sous a week, in return for their help, or, as the case may be, an extra pot of beer, a little tobacco, or some other innocent indulgence. Some of the men even work on their own account; but in no case is coercion used to make them work; the force of example and gentle encouragement alone being relied upon as effectual. Thus, these afflicted beings, who, as a general rule, are incarcerated as dangerous to society, and, if left at large, are avoided by women and children, and timid men, with unconquerable dread, are in Gheel allowed to circulate freely in house, garden, street, and field. Except in some cases when it is especially forbidden by the superintending physicians, the harmless lunatic is even permitted to frequent places of public resort, where he may read the newspapers, smoke his pipe, play at cards, or even drink a pot of beer with his

neighbour, for it is not all work and no play as Gheel—the tavern-keepers being merely prohibited, under penalty of a fine, from selling wine or spirits to the insane. Amusement is even specially provided for the insane, music being more particularly favoured, and is another means of drawing the sane and the insane population together, without detriment to the former, and with great benefit to the latter. There exists at Gheel a choral society, instituted by a lunatic violinist. In the concerts given by this society, the music is performed by the most skilful musicians, without any reference to their mental state; and a singing-class for the use of the insane is also kept up.

To sum up, liberty and work are the two fundamental principles of the system followed at Gheel in the treatment of the insane, and with the happy results, that the human dignity of the patient is never wounded, and that his enjoyment of life is left unimpaired as far as his unfortunate condition will allow of it. However, there are of course cases in which measures of restriction must be had recourse to even in this happy colony, and the means then employed are pretty much the same as used in ordinary lunatic asylums. To prevent evasion more especially, a regular system has been organised; but it is seldom called into activity, as attempts at flight are of rare occurrence—on an average, six or eight in a year—and are generally frustrated by the people themselves, without having recourse to the public authorities.

For centuries the people of Gheel were probably left uncontrolled to do, in regard to the lunatics intrusted to their care, as they might deem most fit. Local acts from the seventeenth century, still extant, shew, however, that at that period the lunatics were under the guardianship of the local authorities, though few improvements seem to have been introduced into the mode of treatment, except such as would naturally follow from increased well-being, and more advanced civilisation among the population in general. The modern history of Gheel may be said to date from 1795, when Belgium was incorporated with France, and divided into departments. At that period, this modest institution attracted the attention of M. de Pontecoulain, prefect of the department of Dyle. Comparing the condition of the insane, crowded together in the dirty, unventilated, fetid hospitals in Brussels, the capital of the department, with the advantages enjoyed by those distributed among the inhabitants of the commune of Gheel, he ordered the former to be transferred to this more healthy refuge. This example was soon followed by various other cities of Brabant, and also of those of Southern Holland, after the reunion of Belgium with that country; and thus, after centuries of obscurity, Gheel at last attained a certain degree of celebrity. In 1825, Dr Guislain, professor of the university of Ghent, one of the first who exerted himself in favour of reform in the treatment of lunatics in Belgium, devoted special attention to Gheel and to the system pursued there; but being a rather one-sided admirer of the improvements introduced into France by Pinel, Esquirol, and their disciples, he gave a very unfavourable report of the opposite mode followed at Gheel. The severity of this judgment led to a thorough investigation on the part of the government, which resulted in a series of ordinances and rules, placing the lunatics of Gheel under the special guardianship of the central as well as local authorities, and establishing constant medical supervision, without, however, as we have seen, in any way altering the patriarchal relationship between the insane and their *pères nourriciers*, which has existed for ten centuries.

The total number of inhabitants in the commune

of Gheel amounts to about 9000 or 10,000, and the lunatics, varying in number from about 800 to 1000, constitute about one-twelfth of the population. These latter are either located in the town itself or in the neighbouring villages belonging to the commune, according as the friends of the patient, the authorities concerned, or the medical men residing on the spot in an official capacity, may determine. These physicians are four in number, one acting as superintendent, and the three others as physicians of sections, in which capacity they are bound to visit each patient belonging to their section once a week, and to draw up a quarterly return of the state of all for the central authorities. At Gheel, however, the physician plays but a very secondary part, and acts more as a moral guardian watching over the kind and just treatment of the patients, than as medical adviser. The people of Gheel, as has been said already, have great faith in their own power over the insane, and for a long time their religious feelings revolted against attributing the cures effected in their commune to any but miraculous causes. To the zeal with which the miraculous interposition of the patron saint of the insane was sought, the flags that pave the chapel, alluded to above, which contains the legend of St Dymphne, bear evidence, for the stones are actually hollowed out by the knees of the patients or their representatives who, during the course of centuries, have repaired to this spot to implore the intercession of the saint. While going through the ceremony of the so-called *neuvaine*, which consists in passing on their knees nine times to and fro under the cenotaph of the saint on nine consecutive days, the patients generally reside in a humble cottage built up against the wall of the church; and as the women who attend upon them here complain of a sad falling-off in the number of pilgrims, and consequently in their own fees, there is reason to believe that a falling-off is also taking place in the faith of the population in the miraculous power of St Dymphne. At one time, the canons of the church were privileged to exorcise the demons of insanity, but of late years their vocation seems entirely to have ceased.

The population of the commune of Gheel is purely Catholic; but that liberty of conscience which is guaranteed by law in Belgium, seems to be sincerely respected in this little community, no attempts having ever been made to effect conversions among the insane, who, being often sent thither from a distance, belong to various religions and various nations. All conditions, all ages, all nationalities, all religions, are received here on equal terms, and so also are all classes of mental disease, with exception of such as take the form of suicidal, homicidal, or other monomanias dangerous to society, and the treatment of which would be incompatible with the general system pursued. The rustic simplicity of the population, and their mode of life, may also seem to exclude patients accustomed to the luxurious comforts of a wealthy home; but there are families in Gheel who live in a style very similar to that of most persons in the middle classes on the continent, and in whose houses rich lunatics may be comfortably if not luxuriously accommodated. The terms paid for boarders, requiring nothing more than the ordinary fare and accommodation, are exceedingly moderate. In 1856, the price fixed by the authorities was 237 francs 25 centimes, or about L.9, 10s. a year, for harmless patients; and 266 francs 45 centimes, or about L.10, 13s., for such as are mischievous, or are suffering from epileptic fits; which sum comprehends everything but clothing.

We regret that our space prevents us from entering into some statistical details, more especially regarding the number of cures effected at Gheel, and the general results of the mode of treatment followed there; but for those we would refer such of our readers as

may take an anxious interest in the subject, to the November number of the *Revue des Deux Mondes* for 1857, from which we have borrowed our facts. Our object has chiefly been to make it more generally known, that there is a not very remote spot on the earth, where the insane may enjoy all the care and attention which their melancholy condition requires, without being cut off from the society of those not similarly afflicted, without being incarcerated with hundreds of others in the same sad state as themselves, and subjected to a discipline and restraint which, however disguised by kindness and by science, is for ever reminding those who have lucid intervals of their lost liberty, and of the exceptional conditions of the life they are leading—and perchance to suggest the possibility of imitating so desirable an institution.

THE LAST DAYS OF BYRON AND SHELLEY.*

ACCORDING to the old proverb, It never rains but it pours. For several years, nothing in the way of biography reminiscences or recollections came forth from the press regarding Byron or Shelley, till Mr Middleton's highly interesting and poetical biography made its appearance, when suddenly there was a rush of publications, short and long, on the same subject, not to speak of others perhaps only projected in the cloudy halls of the poetical Valhalla.

Among these works is the curious production of Mr Trelawny. Properly speaking, it is a section of his own biography, detached apparently from the rest, because relating to a period during which he was connected accidentally with distinguished men. The writer himself is a man of considerable abilities, but so very much carried away by self-esteem as to be altogether incapable of appreciating other men correctly. He has, besides, the affectation of thinking meanly of the art by which he has made himself known, so far as he is known at all. He appears to imagine, that although the act of thinking has, intrinsically, nothing disreputable in it, the case is altogether different when, for the benefit or amusement of others, a man undertakes to describe or explain his thoughts. He then becomes, in Mr Trelawny's phrase, a man of the pen, weak, wayward, full of perverseness, devoured by the rage for notoriety—in short, a complete slave to what Mr Trelawny regards as the inherent vice of his calling.

We almost fancy we can divine the true history of this persuasion, as well as the reason why this irregular Recollector so greatly prefers Shelley to Byron. The former, timid, effeminate, a perpetual prey to shrinking delicacy of constitution, naturally suffered Trelawny, or any other robust man, to influence his movements, and almost give a direction to the current of his thoughts; while the latter, fiercely jealous of his mental independence, repelled, and perhaps resented, every attempt to interfere with the spontaneous action of his intellect. Hence, on all his literary projects, Shelley was communicative, while in the same degree Byron was the reverse. With the quick eye of genius, the latter perceived at once that Mr Trelawny was not a man with whom, in the poetical sense, he could sympathise. When he was furthest removed from himself, he came nearest to the author of the Recollections. His genius, his love of the beautiful, his intuitive perception of all the sources of greatness and glory, dispersed profusely throughout the universe, his love of great deeds and great men, the quickness with which he could catch and translate into verse the evanescent loveliness of nature—all these things were his own; and

he wisely took care, when in company with the uninitiated, to keep them to himself. He knew what Mr Trelawny could understand, and what he could not; he therefore talked to him of boating, swimming, boxing, of saving money, buying islands, sailing about the Mediterranean with old Bathurst, the golden astuteness of the modern Greeks, and so on. With a companion of his own calibre—if he could have found one—his conversation would have been in totally different channels; and he would have flooded his fancy, as in his writings he flooded the whole universe, with brightness and beauty. Leicester Stanhope relates of him, that frequently on board ship on the Mediterranean, in the midst of jovial companions, who were addressing themselves to the lowest part of his nature, tears would rush into his eyes; and that to conceal them, he would start up suddenly, and leave the cabin. The source of those tears, perhaps, lay deeply buried in the consciousness that he was wasting upon trivial or mean topics the glorious faculties which nature had given him for better things. To this peculiarity he himself alludes in *Childe Harold*:

'Tis said at times the sudden tear would start;
But pride congealed the drop within his eye.

In all ages there have been men who considered it necessary to have two philosophies—the esoteric and the exoteric—the one for themselves, and the other for the rest of the world. Byron had his esoteric system of thought, which he concealed from those about him, but, under the pressure of strong necessity, infused more or less completely into his works. This was reversing the plan of the old sages, who unveiled their souls to their companions, while they afforded only transient glimpses of them to the world. But this, perhaps, was more an affair of luck than anything else. Those fortunate men were encompassed by a circle of choice spirits, who, if they could not originate ideas like theirs, could at least receive and reflect them forth with force and fidelity upon mankind. By a strange misadventure, Byron was nearly always surrounded by the least spiritual of the human race, with whom his intellect and his genius possessed nothing in common; he therefore, as far as possible, concealed his mysterious greatness from them under a veil of vulgar banter and frivolity, while he threw out brilliant rays of mind over their heads, to charm and enlighten distant ages.

We envy no one who can persuade himself that Byron did not mean what he wrote. We beg to observe that there is an art by which it is possible to discover unerringly when a man is in earnest, and when he is not. The affectation of opinions and sentiments is a cold thing, and can at best only glitter across the fancy, without reaching so far even as the imagination. It is an altogether different thing when, by some power inexplicable in words, a man projects his thoughts into your thoughts, agitates them violently, fuses them with emotion and passion, moulds them into what shape he pleases, and leaves for ever after the stamp and impress of his mind upon yours. Be sure he is thoroughly in earnest when he does this; affectation has no such dominion. Byron was only laughing at Mr Trelawny when he told him that all he had written was meant merely for the women, and did not express his own feelings at all. He saw the extent of his credulity, and played upon it. There are many passages in *Childe Harold* and *Don Juan*, in *Manfred*, *Werner*, and *Sardanapalus*, which the brain of itself could not have created; it required the co-operation of the heart, and therefore they will speak to all ages as they have, in fact, placed him among

Those dead but sceptred sovereigns who still rule
Our spirits from their urns.

* *Recollections of the Last Days of Shelley and Byron.* By R. J. Trelawny. London: Moxon, 1853.

We are sorry always to observe in the records of Byron's life any traces of that portion of his career which was spent among persons of his own class in London. Their society did him a great deal of harm, both as a man and as an author. It was under their influence that he addicted himself to athletic sports, for which nature had altogether unfitted him; and that he adopted and used occasionally the jargon of fashionable persons, who affected to think meanly of those things which are alone estimable in the world.

We can easily imagine, however, that in exhibitions of muscular power, he was inferior to Mr Trelawny. He was also inferior to most persons in the capacity for eating and drinking. He cared very little for beef and mutton, and still less for that alcohol under the influence of which he is supposed to have often written. On the contrary, he lived as abstemiously as a hermit, that the fine ducts and channels of the brain might be left open for the passage of those airy spirits which are the mind's ministers, and co-operate in all its creations. We are glad to have Mr Trelawny's testimony to this fact. Apparently, however, Byron found it necessary to assign other than literary reasons for his hermit-like life. To the greater part of his associates, he would have put forward in vain the claims of the intellect, the pleasures of a clear head, and the delights of an unburdened fancy, that lives in the colours of the rainbow, or plays in the plighted clouds. He placed the source of his frugality in his apprehensions of fattening, as Mr Trelawny observes, who, in speaking of the poet, often employs the vocabulary in which farmers discuss the merits of a stalled ox.

But whether it was the fear of fat, of the stings of repletion, of headaches, indigestion, or anything else material, or the reluctance of the intellect to be buried under the Pelion upon Ossa of English dinners, the fact remains indisputable, that Byron ate little and drank less. On the other hand, he had what the world calls bad habits; he sat up late, and lay in bed in the morning; but whoever has lived much in the south may easily conjecture the reason. The nights in those parts of Europe possess an irresistible charm for poetical and thoughtful minds, when all nature is hushed as in a dream; when the stars appear to descend in clusters towards the earth, and when the breath of our great mother in her sleep is inexpressibly sweet and soothing.

Byron loved to be near the sea, which, in the still, calm hours of night, sends up voices replete with inspiration to the ear. To these voices he delighted to listen. They spoke to him of many things, which he could not venture to discuss with his everyday companions. The mind which is conscious of its power to create, must desire to consult the past, and to throw its glances forward into futurity. At night, upon the margin of the main, it is rapturous to do this in Italy, especially when the moon, in full splendour, diffuses her white light over the waves, forming an endless vista of glory, through which speculation appears to penetrate into eternity. Besides, whatever may be said, every man who possesses ideas of his own, desires and needs to be often by himself. It is at such times only that he can explore the extent of his mental wealth, and exercise unimpeded the prolific faculty of invention. It is said that Shelley's friendship exerted a beneficial influence on Byron's mind. In a literary point of view, it might. Shelley's brain, like a caldron, was always seething with new ideas, which, wherever he went, he threw around him like an atmosphere. He was besides, large-minded, generous, and free from jealousy. He could therefore behold without envy Byron's superior popularity, while he admired frankly the works of his greater and infinitely more successful rival. To this part of Shelley's character Mr Middleton has done more

justice than Mr Trelawny, or, indeed, than any other writer who has touched on these points. He has, perhaps, been too desirous of elevating his hero at the expense of all who came near him; but he has not done this blindly, or without laying fully before others the reasons which determined his own conduct. Mr Trelawny entertains the same preferences, but without being able to assign the same reason for them. Nature has not gifted him with the faculties necessary for appreciating lofty poetry, while Mr Middleton is himself a poet, and yet devoted to the task of celebrating the poetry of another.

Of course, as a personal acquaintance—for of Shelley or Byron, Mr Trelawny was no more—he can supply descriptions and relate anecdotes which take their colour and character from actual intercourse. Mr Trelawny's book contains many of these, and they entirely constitute whatever charm there is in it. We are familiar with many of the spots he describes, and, therefore, to some extent at least, are able to judge of the felicity of his descriptions. Occasionally, he places a picture before you very successfully, but only of detached portions of a landscape. By going again, and again, over the same ground, he manages to convey some idea of the scenery about the Gulf of Spezzia, of the vicinity of Leghorn, of Pisa, and the Monte Viso, but coarse and material images always prevail, and spoil the general effect and description. The best passage in Mr Middleton's biography of Shelley is that which describes the cremation of his body on the Italian shore. Every idea introduced is poetical and grand. The scene is invested with gloom; the attributes of the coast are brought out distinctly before the eye—the sea, the mountains, the heavens, with a solitary funeral pile, and a few sad and melancholy friends standing reverently near it. Nothing is introduced calculated to disgust, or even to shock the mind. The imagination is hurried back to classical times, and you imagine you behold a little knot of pagan friends reducing the remains of some beloved individual to inodorous ashes, that they might be preserved for ever within the sacred circle of the family. Mr Trelawny converts the scene into a hideous and loathsome exhibition, calculated to inspire the utmost horror. It reminds us strongly of the doings of ghouls, who, in oriental fictions, tear up dead bodies from the grave for odious and unholy purposes. We shall not defile our pages with an extract, but if any one be in love with the nightmare, and would like to people his dreams with frightful figures and prospects, he may read the whole account in Mr Trelawny's book. He must have a strong stomach if it does not make him sick, and a strong mind if he passes a comfortable night immediately after perusing it. We have known persons whom it has haunted for weeks. This we do not mention as a recommendation.

With regard to the great poet himself, it has always appeared to us matter of deep regret that some one capable of understanding his mind, and of faithfully describing his manners, was not with him during the latter portion of his life. He certainly deserved to be comprehended, but was not. His ultimate drifting towards Greece looks, more than any modern event, like the work of destiny. He appears all the while like one of the old heroic race labouring under a spell. Individuals, frivolous, mean, and selfish, who are cleverly described by Mr Trelawny, flutter before him, and draw him by a terrible fascination towards the fatal spot. Once in the Hellenic waters, he sails up and down the coast, landing occasionally on some beautiful island, from the summit of which he beheld—what was not visible to Mr Trelawny—the Greece of other days, whose soil was trodden by great men, whose atmosphere inspired great thoughts, and whose every nook and crag, and glen,

are redolent still of freedom and poetry, and beauty and heroic war.

Byron was no great reader of Aristophanes, otherwise, as he drew towards Missolonghi, he might have been scared by the resemblance of its vicinity to the bogs and fens of Acheron. Mr Trelawny describes the spot with picturesque felicity. All around the city, he says, marshes, lagoons, and slime spread a belt of death. No language could be more correct. But Mr Trelawny was not with Byron when he took the fatal resolution of setting up his tabernacle on that pestilential spot. No one indeed was with him who could exercise the slightest influence over his movements; and it appears incontestably from Mr Trelawny's *Recollections*, as well as from many other sources, that the author of *Childe Harold* and *Don Juan* was not at that time in a state of mind which qualified him to take proper care of himself. Whatever may have been the causes that brought about such a result, he had reached that degree of exhaustion in which men become sensible of the tediousness of life, and begin slowly to make up their minds to escape from it. Shelley was anxious to have always at hand a swift poison, to which he might have recourse when the condition of his mind should become unendurable. To this he evidently looked forward undoubtedly. He reckoned confidently upon its coming some day or another; and already at the age of twenty-nine became conscious, through various symptoms, of its approach. Byron cultivated the habit of sleeping always with the Bible and a pair of loaded pistols on a chair by his bedside.

These facts suggest very gloomy ideas, and at the same time force us into the conviction that a life of systematic excitement, whether literary or otherwise, is not good. The thinkers of old times, at all events, eschewed it as among the worst of evils. There was another thing, also, which they eschewed with still greater care—namely, the practice of living by opinion, of referring all your actions to the criterion set up by the world's estimate. They thought it best to judge for themselves, since if any one thing can be said to belong to a man more than another, it is his own happiness.

No one need be surprised to find that Byron, like all other men, had weaknesses; but it is surprising to make the discovery which has long ago been made, though Mr Trelawny supplies some fresh illustrations of it—that Byron was goaded almost to madness by dwelling perpetually on his club-feet.

It would be ridiculous affectation to pretend that there ever existed a man who would not have been vexed at being misshapen like Byron, but there have perhaps been few who would have taken it to heart as he did. By way of carrying on the contest with nature, which he commenced in an evil hour, he aimed throughout life at distinguishing himself by athletic exercises, which, on account of his deformity, caused him so much pain, suffering, and loss of animal spirits, that he may almost be said to have been a martyr to the cause of his own feet. So far did he carry this feeling that it was among the uppermost in his mind even in death. Mr Trelawny knew of the existence of this strange sensitiveness, but treated it with as little respect as Moore did his much nobler kind of sensitiveness—about the way in which his memory would be cherished by posterity. The one destroyed his impassioned pleading in his own behalf, thus defrauding equally the poet and the world; the other lifted the veil, or rather the shroud, from his corporeal imperfection, and made known what Byron's vanity took much greater pains to conceal than any flaw in his moral character.

On this point, however, we shall allow Mr Trelawny to speak for himself. He is peculiarly at home in whatever concerns dead bodies, and appears to enjoy
